then said, "much worse..." but it was easy to see that this was not the expression of her thoughts. Fanchette understood but too well, and a sob escaped from her.

A tear flowed slowly down the emaciated cheek of the poor woman, and raising her eyes to heaven, she said:—

"My God! I confide them to thee.... My God! do not abandon my poor children!" and then perceiving that Fanchette could no longer restrain her tears, she added: "God is great, my daughter; let us respect the decrees of his holy providence! To murmur is a crime.... He who trusts in Him shall never be confounded, says the Scripture.... and now, whilst I have strength enough to speak, listen to me."

Fanchette answered not, but, with heaving bosom, made an effort to restrain her grief whilst listening to the words of her mother.

"Poor child!" said the dying woman, passing her thin burning hand through the beautiful black hair of her daughter. "You have been for six months your poor mother's nurse, and almost that of your brother and sister.... you may very well be weary!...." And the mother tenderly regarded the already faded cheek of the young child, whence continued watchings and labour had banished the bright tint of health and youth.

"Weary!" repeated Fanchette, passionately embracing the hand of her mother, which she drew down from her head to her lips. "Oh! my mother, can one be weary when they are taking care of a mother?"

"My darling!.... how like your father!.... my poor Brulard.... in everything.... as good a daughter as he was a son.... for he also took care of his poor old mother.... until the hour of her death.... He soothed her last moments, as you now soothe mine.... Poor Pierre!.... I married him then. We lived happily for six years!.... six years!.... My God, I thank thee for these six years' happiness.... No doubt we then committed some fault which drew down Thine anger upon us.... Let it fall heavily on me, O my God! but have mercy on my children!" The fervour with which the widow Brulard pronounced these words having exhausted her, she remained silent for a few moments. Fanchette unceasingly bent over her.

"Mother," said she, "will you have a spoonful of your draught?"

And as the sick woman made a sign of acquiescence, Fanchette ran to a phial, and, pouring the contents into a pewter spoon, returned to the bed, and assisted her mother to raise herself a little with the hand which was free, while with the other she held the spoon to her lips.

"Thank God," said Fanchette, "it seems to revive her," as the dying woman continued in a clearer and stronger voice: "The rain and hail destroyed our crops, and we were about to fall into the most abject poverty.... One day.... I remember it well, you were five years old, Fanchette, you were playing near me, I was nursing little Pierre, and was in the family way with Lazette, Brulard entered the cottage, his face pale and agitated; he threw a purse into my lap.

"Wife," said he, "that is from the Emperor."

"And what have you given in exchange?" I inquired.

"A thing of little value," replied he; "a body and two arms, become useless upon a soil upon which the curse of God has fallen, otherwise our crops would have been blest to us.... I set out to-morrow to join the army at Erfurth."

"This was the 2d of September, 1808.... The 7th of July, 1809, I read his name in the list of the killed at the battle of Wagram...."

The dying woman again paused, overcome either by her weakness, or by so painful a remembrance.

"Since then.... I have known nothing but suffering!.... Had even health been left to me!.... but no, I received a mortal blow on reading that fatal list.... I never recovered it.... grief and hard labour have heated my blood.... I am dying, Fanchette.... It is in

vain that I would wish to disguise it from you, my poor child! I must tell it to you.... do not weep.... I have a charge to entrust to you.... a sacred and a noble charge.... To you, who are not yet twelve years old,—to you who are yourself a child,—and who as such should know life only in its smiles and in its joyousness:—to you, Fanchette, I bequeath your brother and sister.... be to them a mother.... my child.... teach them to pray to God.... Tell your brother to be an honest man.... Teach wisdom to your sister.... Be all three honest and virtuous, and when I am no more.... come sometimes to pray over my grave."

Here the poor mother was obliged to stop; a profound silence succeeded to the sound of the dying woman's voice, which was only interrupted by the convulsive sighs of poor Fanchette, who felt as if dying with her mother, and who, by burying her face in the bed-clothes, sought to stifle her cries and sobs.

"Fanchette, Fanchette," soon murmured the sick woman, "where are you?.... my daughter.... is the light out, that I cannot see you?"

Almost cheating herself into the belief that it was so, Fanchette lighted another candle, though her heart told her that it was the shades of death that were darkening those eyes, which when she again took her place beside the bed were fixed and glassy.

"Mother!.... mother!" cried the unhappy child. Obtaining no answer, and perceiving that the breathing of her mother was becoming more laboured, Fanchette believed she was going to die, and this idea filled her with terror. Nevertheless the resolute child did not lose her presence of mind: her mother must have a doctor, and, without considering the advanced hour of the night, or the dreadful weather, she rushed from the cottage; then, without covering on her head, without shoes, feeling neither the snow which fell around her, nor the ice which crackled under her feet, insensible to the sharpness of the cold at twelve degrees, she flew with the rapidity of an arrow from a bow over the distance which separated her cabin from the abode of the doctor.

It was ten o'clock when she knocked at the door. The doctor was going to bed; he was in his dressing-gown, and had only to take off his stockings when Fanchette arrived. "My mother is dying!" This was all the poor child could say; and, indeed, this was enough to explain the unseasonableness of her visit.

For a long time, the doctor, a respectable old man, had divided his practice between his son and son-in-law; yet reserving to himself the poor of his district, he knew of the illness of the widow Brulard—he knew that she had reached the last stage of her sufferings; and though he was fully persuaded of the uselessness of his visit, he did not the less quickly dress himself to go to her.

"Come near the fire," said he to Fanchette, whose teeth chattered with cold, and who was shivering in every limb; "warm yourself, I will be soon ready, and we can go together."

"Oh! excuse me, sir," said Fanchette, "but perhaps at this moment my mother may want me.... she is alone.... and dying, sir."

"But you are frozen," said the doctor, taking her little hand in his, which was like an icicle.

"Frozen!" said Fanchette, disengaging her hand—"on the contrary, I am burning, sir.... You will excuse me, will you not?" added she, in a suppliant voice, as she gained the door. Then, taking advantage of the silence of the doctor, who was looking for his boots, the young girl stole away, and returned home at full speed.

The same silence reigned in the cabin. Fanchette flew towards the bed; her mother's eyes were closed, her breathing was slow and gentle, her hand had lost its stiffness, but was heavy, damp, and cold. Fanchette took it in hers, in order to warm it.

The doctor found her thus.

"Hush! she is asleep," said she, as she perceived him. "Ah! you have awoke her!..."

And indeed, at the moment that he approached the bed, the dying woman opened her eyes, turned them on Fanchette, and from her on the cradle where the two other children were asleep, and she breathed a sigh—a very faint sigh. The doctor saw it was the last; as for Fanchette, she still had hopes.

"Mamma!" said she, with a tender caution, almost maternal: "mamma, it is the doctor; how do you feel? ... tell him.... he has left his bed to come to you.... Mamma, will you not answer me?..."

But perceiving that her mother was motionless, and that her voice had no power to rouse her, and feeling the trembling hand of the doctor, who endeavoured to remove her from the bed, she uttered a fearful cry, and clung more closely to her mother.

"Mother!" cried she, in despair. "Oh! my God, have I no longer a mother!"

These cries awoke the two children, who called her. Fanchette turned towards them, and, in a tone impossible to describe, she cried,

"You are orphans!"

CHAPTER II.

THE rays of the sun shining through the lattices of the little cabin of St. Gratien fell upon the poor Fanchette as she still knelt beside the bed, and, with despairing sobs, called upon her mother, while the two children, seated in the cradle, were gazing with bewildered looks on their sister, and upon the bed where they no longer saw their mother's face.

And thus the day was passed. Fanchette never left her place, save at short intervals, either to give the children something to eat, or to render them any little service of which they might stand in need; but she did not take them up. They were too young to know the loss they had sustained; and they might perhaps have gone out to play..... To play!.... whilst the body of their mother yet lay extended on her couch of suffering! The young girl felt all that there would be painful and incongruous in this childish thoughtlessness at such a time. As to her, she took nothing; not because she considered it a duty to abstain, nor because she supposed that it would be a sacrilege to eat with the body of her mother before her, but simply because she did not think of it. Her loss absorbed her every faculty, and left her but one other thought—that of watching over the precious deposit which a dying mother had bequeathed to her.

The sad rites that complete bereavement were now over. The body of her mother was hidden from her eyes, and borne to its last resting-place, and Fanchette felt that she was now indeed alone. On that night the young girl for the first time for six months took off her clothes to lie down. Her first thought on awaking next morning was of her mother. It was so short a time since she had been nursing her, that she rose hastily, as if by instinct, to nurse her still; but the empty couch of her mother recalled her to sad reality, and her tears flowed afresh.

Then the children awoke: and, like Fanchette, their first word was—"Mamma!"

Fanchette ran to them, took them in her arms, and tenderly embracing them, said:

"I am your mother now, my dear children; you have no other.... Call me mamma; I will love you, I will care for you like a mother.... You must love me dearly, to console me for her loss; and I will love you, so as to make you forget that you have lost her.... Pierre.... Lazette.... kiss me."

"But where is mamma!" demanded the children.

"She is gone on high, to rejoin our father," replied Fanchette.

"And shall we never see her again?"

"Never again!" replied Fanchette; and this sorrowful remembrance renewed her tears.

However, calming her grief, lest she might sadden too much these orphans, who were too young to feel how irreparable is the loss of a mother, she dried her eyes, dressed the children, and brought them to the door of the cabin.

She was seated on a stool, with Lazette before her, and holding her arm round Pierre, who kept on saying—"You are our mamma, then!" when a young lady, mounted on a donkey led by a little boy, arrived at the cottage.

Fanchette at once recognised the doctor's daughter, and rose.

"Poor children!" said the young lady, seating herself on the chair which Fanchette presented to her, and taking on her knee the little Lazette, who stretched out her arms to her. "My father has told me of your sorrows."

Then gently and kindly motioning to Fanchette to sit down opposite her, she added—

"I have been thinking of you, Fanchette, and of your little family; and this morning very early I have gone all through St. Gratien on your account. You are much beloved in the country, my little one, and I scarcely needed to say a word, when every one pressed upon me an offering.---Look," continued the young lady, as she took from a little basket which she had laid on the ground a purse full of money, which she presented to Fanchette, who drew back in astonishment.

"For me! madame!" cried she.

"Yes, child; but why do you not take it?"

"For me!" again repeated Fanchette, whose cheeks were covered with blushes. "You are very kind, madam.... indeed.... I do not know how to thank you for so much kindness.... but.... my mother always told me never to receive money which I had not earned.... and I have not earned this, madam."

"Your mother is no more, child; whilst she was alive, she was able to provide for your wants, but now.... we must think of that for her."

"But I am not in want of anything," replied Fanchette, with a modest pride. "I have still a little money for my housekeeping. My parents, unfortunate as they have been, have never begged; and, whilst I have health and hands, I hope I shall never have need of alms to assist me in the care of my dear little family...." And then fearful of having given offence, she added—"There are so many poor here, my good lady, on whom you might better bestow your money; as for me, I would ask one favour of you, if you will have the goodness still to interest yourself for me: it is to recommend me to some of your acquaintances, so that I may not be left without work."

"Charming, noble child!" exclaimed the young lady, unable to repress her tears. "No—I will not insist on your keeping this money; you wish to earn it, and you shall earn it, my girl.... Farewell.... Take care of your health, and always be assured of the friendship of those who have hearts to feel." Saying these words, the young lady tenderly embraced Fanchette and the children, again mounted the donkey, and went away.

Fanchette was able to darn stockings, and did plain work very well. It is easy to guess that all the inhabitants of St. Gratien, of Enghien, Montmorency, and the neighbourhood, who had contributed to the collection made by the doctor's daughter, were still more ready when their money was returned to send work to the orphan girl; and it is not less easy to conceive that they did not bargain with her, but even wished to give her more than she asked, but this was impossible; they dared not propose it to her.

The orphan of St. Gratien soon furnished an example of what order and economy can accomplish, united to resolution. Rising at four in the morning, the diligent girl began to work. At seven o'clock in summer, and eight in winter, she awoke the children, took them up, washed them, dressed them, kissed them, and gave them their breakfast; then she prepared pre-

visions for the rest of the day, and arranged her house, which was always remarkable for its order and neatness.

About noon, if the weather was fine and dry, she took the children into the neighbouring woods, and whilst they ran about, collecting dry sticks, moss or withered leaves for fuel, she sat down on the ground, at her needle-work. If the weather was bad, the children played near her in the cottage.

On her return from these little walks, an exercise as healthful for her as for the children, she set to work again till nightfall, when she put the children to bed. There was much more to be done. This interesting orphan did not think her task completed; nor did she go to bed until she had brushed, washed, and mended the clothes, now rather old, of Pierre and Lazette. These cares fulfilled, Fanchette retired to rest. What mother could have been more tender or more devoted?

In proportion as Pierre and Lazette grew up, their wants increased, and became more difficult to meet; but Fanchette also grew taller and stronger. Certain it is that her zeal increased with the wants of her little family. These three orphans were very poor, indeed; their destitution was extreme. Their breakfast consisted of a bit of dry bread; and a milk or vegetable porridge was all their dinner. Sometimes there was something left for supper, but very rarely. They ate meat only on holidays; and yet never were they seen dirty, or in rags; the patches on their clothes were always of the same colour and same material with the dress; but they all three went barefoot in the summer.

At last the time came when Pierre and Lazette must be sent to school. Well, Fanchette, by her labour and economy, found means to meet this new expense; but, alas! how many hours more of watchfulness and labour did she undergo in order to earn the necessary money!

Our three orphans lived very happily, though poor,—and contentedly, though labouring hard. Fanchette had just reached her nineteenth year, Pierre was just fourteen, and Lazette thirteen, when, on the 25th of August, 1822, very early in the morning, a handsome equipage drove rapidly through the village of St. Gratien, slowly ascended the steep though short hill, and, to the great astonishment of the inhabitants, who were going to their work, took the bye-road which led to the cottage of Fanchette.

THE MAIDEN AUNT.¹

No. III.—CHAP. III.

EDITH and I had scarcely finished breakfast, the following morning, when Mrs. Alvanley arrived. I was not disposed to thwart her evident wish to be considered "one of the family," and I allowed her full scope for ingratiating herself with my fair young charge, of which she proceeded to avail herself by paying Miss Kinnaird the most marked attention, implying rather than expressing (every young lady will understand how this may be done,) a very lively degree of admiration of her personal charms, and volunteering a description of the principal families of the neighbourhood, which she gave with some spirit and piquancy, and a little ill-nature.

"You are new to this style of society, my dear," she concluded, "and you will be not a little amused as its involved and nicely-balanced machinery gradually opens to your observation. Happy girl! You don't even know the difference between the 'town set' and 'the county families'—the brand of disgrace and the badge of honour; neither are you aware of that mysterious system of progression by which you rise in gen-

tility as you retreat from the baleful precincts of the town. Now, the wife of a gentleman farmer who lives in a "place of his own"—heaven save the mark!—three miles up the country, is too elegant to visit the lady of an officer, whose family is ten times better than her own, but who is so unfortunate as to dwell within the turnpike. Then you must learn to distinguish the gradation of costume, which delicately marks the various classes, from the Parisian capote and gaudy satins of the attorney's lady, to the straw bonnets and sober-tinted garments of the member's wife and daughters, aristocracy increasing as outward show of it diminishes. All this you will see with your own eyes next Sunday."

"Next Sunday!" repeated Edith innocently. "What happens then?"

"Why, you go to church, to be sure," replied Mrs. Alvanley, "and you will then have an excellent opportunity of seeing all the varieties assembled together, and, if you class them according to bonnets, remembering the rule I have given you, you can't fail of discovering the two extremes at once, though you will require a little practice to discern accurately the intermediate grades."

"I will be very attentive," said Edith, with a glance of extreme amusement at me, "and I dare say, by the third or fourth Sunday, I shall know them all asunder, and be able to reckon them over separately in my mind while the sermon is going on. Don't you think so?"

"Oh fie!" cried Mrs. Alvanley, playfully; "don't let Miss Forder think that I am corrupting your principles. You must listen to the sermon, of course; Mr. Lymes is a very fine preacher."

"Then am I to count the bonnets during prayers?" demanded Edith pertinaciously.

Her instructress seemed a little embarrassed. "Nay, you are rather severe," she said; "I did not of course mean that. But one has plenty of time for such things during the going in and coming out."

"Preparation for service—and practical result produced by it—I understand exactly," said Edith; and then added quickly as if afraid she was being too satirical: "But Mrs. Alvanley, that is the regular conventional description of vulgarity and gentility which you have given—that classing people by their dress. I don't think it holds good in reality—at least I'm sure it would not with me, for I would never put on an unbecoming poke bonnet for the sake of looking aristocratic in a country church."

"I admire that sentiment," cried Captain Everard, entering the room with Frank Kinnaird; "it is as genuine as it is boldly expressed. No higher principle can be proposed to a young lady than that of always doing, thinking, and wearing, whatever is most becoming."

Miss Kinnaird was a little out of countenance, but laughed heartily.

"Well," she said, "it is what we all do, only we are not all brave enough to confess it."

"Very true," returned he; "and it is a fine thing to do what you have done—namely, to bring your avowed principles to the same level as your actions. We won't inquire *how* you have achieved it, but will leave the imagination to conclude that it was by raising the one—not by lowering the other."

"Oh, I can't contend with you," exclaimed Edith. "But I was in hopes that a night's rest would have produced a happier frame of mind. I laid your misanthropy last night to the account of your fatiguing journey, but I begin to be afraid that it is inherent."

"Yes," he replied, "I was born with a cold heart and a sour temper, and I am glad of it. It saves a world of trouble. All those sentiments which you will have to learn by a tedious and afflictive process which I won't pain you by describing, come to me naturally."

"They are not sentiments at all," cried Edith. "Don't degrade the word by such an application."

(1) Continued from page 267.

"Give them a name, then," said he. "What shall I call them?"

"You may call them prejudices and mistakes, if you please," answered Miss Kinnaird smiling; "I dare not, you see, because I have not known you long enough."

I interrupted the combatants by introducing Captain Everard to Mrs. Alvanley. After the usual civilities had been exchanged, he said, addressing himself to me, "I have had an adventure this morning, and I am eager to tell it."

"Indeed!" cried I, "pray indulge yourself. We are all anxious to hear."

"We were alone in the drawing-room at Acton Cottage," he began. "I was studying; Kinnaird was smoking a cigar."

"I!" cried Frank indignantly, "I was not doing anything of the sort. And as to your studies—"

"My dear fellow," interrupted Everard, "these little graphic touches give life to my narration. If you were not smoking a cigar, you might have been; and so there is no harm in handing you down to posterity as having been actually so engaged at a given time. But let me go on. A thundering knock at the door disturbed us—we foreboded visitors; and Frank, who is apt to indulge in a few graceful *ad libitum* variations of costume during a morning at home, was forced to beat a hasty retreat."

"This is the most unfair mode of telling a story that I ever heard," interposed Kinnaird.

"You shall set it all right when I have done," said his friend; "you shall supply a commentary, like the notes to a ghost story, in which the editor takes pains to let his readers know that he is not such a fool as to believe what he is telling, though his teeth chatter, and his hair stands on end, all the while. Well, my teeth chattered I assure you; no ghost could have been so awful as the apparition which followed that knock at the door, and came upon me, deserted and solitary as I was. A lady, enveloped in a perfect haze of gauzes and laces, and the like unsubstantial investments, glided into the room, and addressed me with a degree of warmth that would have overcome a man less acquainted with the amiable impressibility of the sex than myself."

Mrs. Alvanley, Miss Kinnaird, and I, all exclaimed at this, and insisted on his retracting before he could be allowed to proceed.

"Well, then, I recant," cried he; "they are not generally impressive. It is only where I am concerned. Now, don't interrupt me again, pray. You shall be allowed your commentary, as well as Kinnaird, when I have finished. This fair lady addressed me as follows. I shall try to give you her exact words: 'You will excuse this unceremonious visit; but I am so very anxious to make your acquaintance, that I resolved to dispense with etiquette, and come in person to secure you for my party on Thursday evening.' I bowed, and said I should be very happy to come. I always accept invitations, how inexplicable soever they may be. She proceeded—'I am afraid there was a mistake about the note I sent you: I am afraid it was left at the wrong house. But I felt justified by my intimacy with your lovely sister—' Miss Kinnaird, I beg your pardon, I forgot you were in the room. The Unknown continued to talk about you for some time. 'To be sure,' she justly observed, 'that girl is—'"

"How can you be so absurd?" cried Edith, laughing and colouring. "But who was the lady? She mistook you for Frank, of course; and she must be some friend of mine. Do tell me who she was."

"Oh, he'll never tell you!" said Kinnaird. "When he is in this humour there's no getting a word of sense out of him. It was Lady Vaughan. You know they have property in this neighbourhood, and young Lord Vaughan came of age two months ago, and is come down with his mother to winter here. I expect they will be uncommonly pleasant neighbours."

"Lady Vaughan!" repeated Edith, her colour deep-

ening as she spoke; "oh, I know her very well. I spent five weeks in the same house with her last Midsummer, and she was very kind to me. I am glad they are here."

"Was Lord Vaughan of the party also?" inquired Captain Everard quietly.

"Yes!" replied Edith, looking down; "they were both there."

"Lord Vaughan is an extremely good fellow," said Frank. "I saw a good deal of him at Weymouth last autumn, and I liked him very much. They will be great acquisitions. They are coming to call here to-day, Miss Forde," added he, turning to me, "as they are most anxious to bespeak you and Edith for this ball of theirs, next Thursday. And Lady Vaughan begged me to break the ice for her, and induce you to excuse such short notice; it was only the day before yesterday that she knew we were all coming here."

I said nothing of the three weeks which I had passed at Enmore without receiving a visit from Lady Vaughan, who unfortunately had not suspected that the beautiful heiress, whose acquaintance she was so anxious to cultivate, could be coming to reside with a person so unimportant as myself; but I made haste to answer the eager inquiry in Edith's eyes by saying that I should certainly accept the invitation.

"How good of you!" cried Mrs. Alvanley: "You who hate gaiety, and go so little into society! Remember, dear Miss Forde, whenever you find the duties of a chaperon at all too much for you, I shall be most happy to relieve you."

I knew that Mrs. Alvanley would have given her ears to have obtained the *entrée* into Lady Vaughan's house, so I took this self-sacrificing offer for just as much as it was worth, and replied coolly that I had always contemplated accompanying Miss Kinnaird into such society as Alford could afford her, and that I rejoiced for her sake in having to begin the duties of a chaperon so early and so auspiciously.

We were interrupted here by the announcement of the very persons who formed the subject of our conversation; namely Lord and Lady—for, as I suppose I ought to say in the present case—Lady and Lord Vaughan.

Lady Vaughan was a lively, elegant woman, still on the sunny side of fifty, with easy manners, and an abundance of small talk. She contrived to keep the two young men, Mrs. Alvanley, and myself, thoroughly engaged in conversation with her; while her son devoted himself to Miss Kinnaird in that direct, immediate, and business-like manner, which marks the flirtations of some men, and which seems to say, "I came here solely for the purpose of seeing you, and I mean to make the most of my time." This kind of wooing leaves no room for the timid flutter, the sensitive doubt, or the consciousness which detects secret engrossment under assumed indifference; it is resolute and undisguised throughout, and seeks no shadier spot wherein to pour forth its sentimentalities than the ball-room staircase, or the opera lobby. And the character of such a lover, consistently enough, is generally marked by a disposition to seize the prominent features, and overlook the finer details, of whatsoever is submitted to his consideration; you shall find that his enjoyment of Shakespeare is confined to an interest in the story of the play, and that his admiration of the country centres in an intense appreciation of pic-nics. Lord Vaughan, however, was a very favourable specimen of his class. Good-looking, gentlemanlike, and fluent, he amused Edith so well, that there was not a single pause in their conversation, while his merest nothings were rendered interesting by the tone of deference and the look of admiration with which he uttered them.

I watched my fair charge closely, but could not satisfy myself that her symptoms indicated any feeling deeper than the gentle charity wherewith a girl invariably judges her first admirer. Still her state was, to

say the least of it, promising; she blushed, smiled, and did not look him straight in the face; there was no saying to what it might come. I knew that Lord Vaughan bore a very high character, and that, in point of circumstances and position, he was an unexceptionable *parti*, so I resolved to give him every assistance in my power, and I could not help indulging a little triumph as I remembered Owen's exceedingly low opinion of my capacity as a manœuvrer, and anticipated his perfect contentment with the engagement into which I expected that his ward would enter while under my charge. Only two things specially worthy of note occurred ere the lady and her son took leave, viz.; Edith was engaged for the first polka on Thursday evening, and Mrs. Alvanley was expressly included in the invitation to the ball. She owed this little piece of good fortune to the foresight which had induced her to take off her bonnet and shawl immediately after her arrival: Lady Vaughan having concluded, naturally enough, that she was a visitor in the house.

"Well, Edith, I congratulate you!" cried Frank, when we were alone again. "A ball and a conquest so soon after your debut,—it is more than you could have expected."

"Yes," replied his sister, "isn't it nice?"

"Isn't it nice?" repeated Captain Everard, inquiringly. "Which?"

"Neither is to be despised, I assure you," observed Kinnaird. "Lord Vaughan is a most agreeable fellow, and what is more, he bears the highest character possible."

"Indeed," said Everard dryly, "what has he done?"

"Done!" reiterated his friend, half puzzled, half indignant. "I don't know what you mean, Everard. What whim now is it, that induces you to run down Lord Vaughan?"

"Run him down!" cried Captain Everard, a little indignant in his turn; "I never had such an idea; only you are running him up so confoundedly, that it makes a man look about to discover what he has done. 'The highest character possible,' simply means that this promising youth of twenty-one is neither a gamester nor a drunkard; at least I believe that is the plain English of the phrase."

"Nay," interposed I; "You must not deal so strictly with mere conversational expressions. Moreover, I think that a man's merits ought to be judged according to his temptations; and you will allow, that to a young man entering life under Lord Vaughan's circumstances, temptations are neither few nor trivial."

"My dear madam," exclaimed he with earnestness, "Lord Vaughan may be an angel for anything I know, and very probably is. Pray don't fancy that I want to depreciate him."

"No," said Edith, "it is human nature in general that you want to depreciate. You want to renew the argument of last night."

"I did not remember that there *was* an argument last night," observed he quietly. "Who argued?"

I felt absolutely enraged at this rudeness, but Miss Kinnaird only laughed and said, "How insulting!"

"I thought," replied he, "it would rather be an insult to a lady to suppose her capable of arguing. Surely it militates a little against that ethereal gentleness which characterises all the females in your ideal world, and which endears them so much to the high-souled generous men, as companions for whom they were created."

"I wish you would not pretend to know anything about my ideal world," exclaimed she, "you make dreadful mistakes about it. Besides, I should like to know which is most to be reprobated—a woman who cannot argue, or a man who cannot believe?"

"Don't reckon me in the latter class!" cried he, catching for a moment the eagerness of her tone.

"How delightful!" said Edith. "For once you have said what you think."

He laughed. "You don't know me," was his answer, "or you would know that I always speak as I think. You charitably give me credit for being a vast deal better than I seem; on the contrary, like most of my fellow-creatures, I am a vast deal worse."

"I don't think that is possible," cried Edith. "Nay, you need not laugh; I assure you I am in earnest. According to your own profession, you have neither faith, hope, nor charity."

"That is a tremendous accusation," he replied; "of course you are prepared to substantiate it."

"You cannot deny it," persisted she; "you have no faith in human nature, no hope that it will ever become any better than it is, and therefore, of course, no charity."

"You have described me exactly," said he, bowing; "your insight into character is wonderful; you ought to write fashionable and domestic novels."

But Edith was not to be bantered out of her severity. Whether it was that she was genuinely interested in the subject, or that she was a little angry at the disparaging tone which Captain Everard had adopted about Lord Vaughan, I cannot say, but she proceeded with increased animation. "Do you know that I think your opinions are, if sincere, the most wonderful and the most miserable that I ever met with? Have you never in all your life met with affection—real, true, unselfish affection, that can overcome and endure everything?"

There was a momentary expression of pain in his face, as if he shrank from the subject,—at least so I fancied,—but it passed away in an instant, and he answered in his former enigmatical tone, in which neither Edith nor I were able to separate the jest from the earnest, the assumption from the reality: "Oh! yes, often! It is a very pretty thing to play with when the sun shines."

Edith looked at him with an expression of genuine horror; he laughed, and after a moment's pause she continued. "Well then, we won't talk about yourself. Of course you must know yourself better than I do, and if you say that you are incapable of feeling anything, I am bound to believe you. But I will maintain that you have no right to judge other people by the same rule. You must look upon yourself as an exception, and when you want to understand others, you must take it for granted that they have minds and hearts unlike your own. Now, there is Frank for instance—pray don't fancy that his friendship for you is like yours for him."

"Frank is a very good fellow," said Captain Everard with the same provoking smile, looking towards his friend, who had withdrawn to the further end of the room to write a letter; "and I am so well satisfied with his friendship that I would not wish to look too closely into it."

"Do you mean to say that *his* affection is only a play-thing for a sunshiny day?" exclaimed Edith, indignantly; "Do you mean to say that if you were in trouble he would not make sacrifices in order to serve you?"

"I would never ask him," returned Everard.

"Why not? Would you be too proud to ask a service, even of a friend?"

"No," said he, "but I like to keep a few little snug illusions as long as I can; at any rate I wouldn't disperse them with my own hand. But it is a shame to talk to you in this manner. Your faith in your own illusions is so zealous that I would not disturb it for the world."

"You *could* not," cried she. "My illusions, as you call them, are *truth*, and that is my great comfort. It is not because I am young and a woman that I think in this manner—the older I grow, the more steadfastly I hope I shall believe in the reality of everything which you despise! I would rather die this moment than think as you do!"

He looked at her an instant with a half-amused, half-admiring expression, and then replied—"Di chi mi fido, guardami Dio! Di chi non mi fido mi guarderò."

to¹ You know the proverb, doubtless. Kinnaird, isn't it time for us to be moving?"

"I'll follow you," replied Frank, looking up; "I must finish this letter."

Captain Everard bowed and took his leave.

THE BOAT AND THE CARAVAN, A FAMILY TOUR THROUGH EGYPT AND SYRIA.²

The interest of this work is considerably impaired by the attempt, not very skilfully managed, to overlay with a slight coating of fiction a simple and straightforward narrative, which bears the strongest internal evidence of being told, in all other respects, with a scrupulous adherence to truth. An English gentleman in search of health and relaxation, after a life busily spent in commercial pursuits, sets off in company with his wife and child, whether son or daughter we are left in doubt, on a tour through part of Egypt and Syria. But, instead of telling the story of his travels plainly in his own person, he, with the very extraordinary idea of giving "a little variety to the narrative," assumes a fictitious name, speaks of himself in the third person, and adds to his family a supernumerary son or daughter and a female attendant; thus most gratuitously throwing suspicion upon one of the greatest merits of his book, its truth, without in the slightest degree imparting to it the liveliness, or permitting to himself the freedom, of well-managed fiction.

In other respects the work deserves to be spoken of with much praise. The traveller, whoever he is, makes no attempt to astonish his readers by the exhibition of much antiquarian lore; indeed, by addressing his book chiefly to the young, he in a great measure precludes himself from doing so, and the reflections, conceived in the best possible spirit, are sometimes, it must be admitted, rather studiously simplified to the level of infantile understandings. Still he has observed carefully, and described in a very pleasing style, and, we doubt not, with much accuracy, the most striking objects which he met with, and the incidents he encountered on a track not often ventured upon by English ladies and children, and not so frequently traversed by any as to make it impossible to throw both novelty and interest into the account of a journey over it.

As a specimen, and by no means the best, of our author's style, we extract a part of his description of the ruins of Thebes.

"The origin of Thebes is lost in the obscurity of extreme antiquity, and but little is known of its early history. It is supposed to have been founded by the mighty conqueror Sesostrius, who is believed to have flourished previous to the captivity of the patriarch Joseph in Egypt. The recent discovery of a method by which hieroglyphics can be deciphered has already tended to throw much light on the subject; but probably many years will elapse before the chronology of the history of the country will be established, if it be ever clearly settled. But few centuries had passed after the universal deluge before it became a powerful empire, and far in advance of the rest of the world in arts and sciences. The early Greeks acquired most of their knowledge from the Egyptians, and it is supposed that Sesostrius was the ruler over the greater part of Asia. It is remarkable, that while so many of the temples of Thebes remain in a tolerable perfect condition, almost all traces are lost of other less important buildings. If

they had been substantially constructed, they could not have mouldered into dust from the effect of time and weather; for where man has not destroyed, the temples remain almost as perfect as when first erected. It is, therefore, reasonable to conclude that the ordinary habitations of the Thebans were little better than the miserable dwellings of the modern Egyptians. Probably the wealth and power of the country were entirely devoted to the services of a false religion. The priests monopolized all the learning of the times, and illustrated in a striking manner, that knowledge is power. If this theory be correct, we can in some measure account for the extreme magnificence and grandeur of these wonderful remains; but if, on the other hand, we reflect that they were erected at a time when the world may be said to have been in its infancy, and that during the last two thousand years nothing has been produced which can rival the temple of Karnac in magnitude or magnificence, our wonder remains undiminished. Machinery must have existed of which we have no record or conception, or how could masses of stone weighing a hundred tons be raised to the top of columns sixty or seventy feet high? There must, too, have been great knowledge of chemistry, for the colours employed in the decoration of the interior are still as bright as ever. Great skill in tempering metal must have been acquired, for the hard granite, and much harder porphyry, are minutely sculptured, while columns, ceilings and walls, are covered with a boundless profusion of bas-reliefs, all cut with extreme accuracy. The temples of Upper Egypt, and the wondrous pyramids of Sakkara and Ghizeh, alike show how vain a thing is human ambition. The mighty sovereigns who projected them very probably did not live to see their completion, and the very names of these immortal heroes are forgotten.

"The Daltons first visited the Temple of Luxor, which stood within a hundred yards of their boat. A number of Arabs had offered themselves as guides; it was evident that they could be of no service, and as Daيره said, they frequently knew much less of what they offered to show than those they wished to conduct through the ruins; but as it was not likely that they would give up the hope of being employed, one was chosen "*pro forma*," and the rest informed they would not be required. At least half a dozen, however, added themselves to the party, in hopes of coming in for some share of the backsheesh.

"On each side of the grand entrance stood, till very lately, an obelisk of granite, partly buried in the sand, but still rising to a height of sixty feet. One of them was removed by the French a few years ago, and is now placed in the Place de la Concorde, at Paris. It is calculated to weigh five hundred thousand pounds, is seventy-six feet high, and formed out of one block of rose-coloured granite. The cost of its removal from its ancient site, and its erection in its position, was immense. A canal was dug from the river to its base, and it was lowered at once into the vessel which carried it down the Nile. The French engineers pride themselves upon the skill and science employed in transferring the mighty mass to their beloved Paris, but this obelisk is less than two thirds the size of one which stands before the church of St. John Lateran, in Rome. There are three others in the "eternal city" which are of equal magnitude, and seven more of smaller dimensions, all brought from Egypt by the old Romans. The Pasha offered the obelisk still standing at Luxor to the English Government, which was not willing to incur the heavy expense of its removal.

"Behind the obelisk, and close to the Propylon are two gigantic figures in red granite, sadly mutilated, and more than half buried in the sand. Twenty feet of the upper part of each are yet above the surface. The Propylon is nearly two hundred feet wide, and more than sixty high. It is covered with sculpture, and, as at Edfou, a gigantic warrior is represented engaged in

(1) "God protect me from the man I trust! I will protect myself from him whom I trust not!"

(2) London: Bogue, Fleet Street. 1847.

the slaughter of his enemies. On one side, he stands in a car drawn by two spirited horses, who are trampling down the conquered foe, while he is about to discharge his bow among their ranks. In the other, the enemy is represented in full flight, and in the utmost confusion, while he stands alone amidst a heap of slain.

"The next day was devoted to the Valley of Tombs, one of the most interesting and remarkable spots in Egypt. A hot ride of more than a hour brought our travellers to the mountains which enclose it; nothing could exceed the dreariness of the road on which they now entered. High barren rocks shut them in on every side. Their path lay through a wilderness of sand, scattered with hugh fragments of stone, which had rolled down from above. Scarcely a blade of vegetation was visible, and the sun's beams, pouring down on their heads and reflected by the hills, were hardly bearable. The heat of that valley in the summer must be past endurance. Having proceeded for some distance, they reached a still more confined space, and arrived at the spot where the 'kings and counsellors' of the earth built desolate places for themselves. The tombs have been excavated principally on the right side of the valley, and after receiving their tenants, every effort was made to cover the entrances, and it would be easy again to cover up the small unadorned portals with loose earth and stones. Long before the Christian era, most of them had been broken into by the Conquerors of Egypt, and their royal tenants disturbed for the sake of the treasures which were buried with them. They now stand open, and in every instance have been much defaced by the unscrupulous antiquary and wanton Arab.

"The first tomb visited by the Daltons was that discovered by Belzoni, nearly thirty years ago. Entering the narrow and unostentatious portal they passed a long gallery which slopes downwards. The rock in which it was excavated is hard, and of a remarkably close grained stone, resembling that used in lithography. The sides are covered with hieroglyphics in small characters, and cut with beautiful precision. It led into a large hall similarly ornamented. They then descended a staircase, and passing through a long corridor, entered into a chamber of considerable magnitude, which from the splendour of the embellishments, has been called the Hall of Beauty. Where they have not been defaced, the figures are quite perfect, and the colouring remarkably bright and fresh. Beyond it, our travellers had to pass along another corridor, and they finally arrived at the largest hall, where Belzoni found the sarcophagus which once contained the body of the Pharaoh for whom this magnificent resting-place was constructed. He had every reason to hope that it still remained undisturbed, for he had been stopped in his progress by finding the end of one of the corridors blocked up and ornamented like the sides; so as to convey the impression that the excavation ended there. But having made his way through the obstruction and entered the last hall, the sarcophagus was discovered empty, with the lid lying by it, broken in two. A hole in the floor showed that it had been entered by a subterraneous passage made in an opposite direction from the entrance, but the invaders had contented themselves with removing the body and any valuables deposited with it.

"Some of the larger chambers were supported by square pillars, left standing when the excavations were made: they also were covered with sculpture, but being more easy of access than the walls, they have suffered more.

"Large portions have been cut away, and two or three were lying in fragments, left there, the guide said, by Lepsius, after an ineffectual attempt to remove them. When Belzoni entered this magnificent tomb, he found it in as perfect a state as when first constructed; now there is scarcely a square foot of bas-relief which is not more or less defaced. The smoke of the torches and candles necessarily used by visitors is

also obscuring the bright colours and blackening the roof. It is really grievous that a monument of such surpassing interest, that might have been kept in good order for centuries to come, should be so quickly and shamefully mutilated.

"The Daltons entered several other tombs; one is even greater in extent than that called after Belzoni, but not so richly embellished; others are nearly choked up at the entrance. Most of them contain an enormous sarcophagus, without ornament or inscription, and cut out of a block of granite. The ponderous lid lies by its side, generally broken into two or three pieces. The passage leading to the chamber where they are deposited, is just large enough for the sarcophagus to go through: it was probably lowered on rollers, and it would be difficult to force them up the inclined plane without widening the space.

"The beautiful alabaster sarcophagus which Belzoni managed to take out from the great tomb without injury, was sent to England. It is of singular beauty, and nearly transparent, although about three inches thick. He sold it to the late Sir John Soane, for 3000*l.*, and it now forms the chief ornament of his museum.¹ Both the inside and the outside are covered with sculpture, minutely and admirably executed, containing several hundred figures. The subject represents the funeral obsequies of the deceased, and many captives are introduced in the procession: among them the Jews are distinguished by their physiognomy, and serve to confirm the opinion of Dr. Young, who deciphered the hieroglyphics, that it once contained the body of Pharaoh Necho, who invaded Judea in the reign of Josiah.² From the number of halls in this and some other of the tombs, and their elaborate ornaments, it does not seem improbable that part of them at least were designed to be used as banqueting rooms in celebrating the feasts of the dead.³

"The travellers, having first taken lunch in one of the tombs, and rested awhile after the labour of exploring so many, returned into the plain, and visited the Temple at Gournou, which bears the name of Memnonium. Near it lie the gigantic fragments of the largest statue in the world. It must have been an arduous task to destroy it. They cover a large space of ground; and the surface of the different parts of the body is but little injured. It is formed of red granite, of so hard a nature that portions are sent to Cairo to be used in cutting glass. The figure was originally sixty feet high, and weighed two million pounds. The ear is three feet long, and the shoulders twenty-two feet across. From thence our travellers proceeded to a very singular subterraneous Temple, excavated out of the rock. It is not large, and is decorated in a somewhat similar style to the others; but there is reason to believe that it is more ancient than those of Karnac or Luxor. The façade, pillars, and some colossal figures are all cut out of the live rock.

"Near it were some very extensive catacombs, into which the party entered. The first chamber is large; but the stench arising from a countless number of bats which have taken up their abode in these tombs was so great, that no one but Mr. Dalton was inclined to proceed further. Provided with lighted candles, he and Daireh followed the guide, who led them through a long passage, from which others branched off to the right and left. The foul birds of night, disturbed by the intruders, flew about in all directions, sometimes dashing into their faces, and at others putting out their lights. Mr. Dalton proceeded for several hundred yards, through various passages, and then descending a flight of steps, traversed an equal number of galleries running underneath the others. It was a perfect

(1) Sir John Soane left his house in Lincoln's-inn-fields, with all its contents, to the country, and the public are admitted gratuitously during the month of May only, each year. Why it is not always accessible, we do not know. It is well worthy of a visit.

(2) 2 Chron. xxxv. 20, 22.

(3) Psalm cvi. 28.

labyrinth; and more like the courts and streets of a small town, in extent and number, than a receptacle of the dead. There were a few remains of mummies, but almost all had been carried off. Even in the lower story, the bats were very numerous, and the air was extremely hot and close. He returned to daylight in a profuse perspiration, and sickened by the foul smell."

Poetry.

In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.

THE PAINTER'S SOLACE.

O.

[SIGNORELLI had one son, a youth of great promise and exceeding beauty, who was unfortunately killed at Cortona; when he was brought home to him, the body was carried into his painting room, where he painted his son's portrait, and shed not a tear.]

ONWARD the lifeless corse they bear,
And reach his father's roof;
They enter, lay it on the ground,
Then silent stand aloof.
No eye should view a father's grief,—
No voice address his woe;
So they turned, and left him as he stood,
Ere tears began to flow.
And day had passed, and evening fled,
And midnight's fearful gloom,
And at break of day the rising sun
Shone brightly through that room.
The painter rose,—one thought he had
That soothed his breaking heart,
One solace he may yet enjoy,
And owe it to his art.
He rose, advanced with faltering step,
His pallet then he took;
His eye, it was undimmed by tears,—
His hand, it scarcely shook.
Now seated near the lifeless clay,
He traces ere it flies
The beauty dearest to his heart,
And fairest to his eyes.
He paints, and grief forgets to grieve,
And anguish to complain,
While his feeble hand its art essays
The loved one to retain.
His task is o'er, and tranquilly
He sees them bear away
All that once bound him unto life,
And now is only clay.
He gazes on what seems to him
The emblem of that mind,
That face where truth and purity
In beauty were enshrined.
And this alone can soothe his grief
And calm his troubled heart,
Until that blessed hour shall come,
When from earth he may depart.

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne*.

SUPERSTITION REGARDING THE OWL IN CEYLON.

Among the birds in Ceylon there are few more remarkable than the Virginian horned owl (*Bubo Virginianus*). Wilson, who has described this bird in his American Ornithology, tells us that "as soon as evening draws

on, and mankind retire to rest, he sends forth such sounds as seem scarcely to belong to this world, starting the solitary pilgrim as he slumbers by his forest fire, 'making night hideous.' This ghastly watchman has frequently warned me of the approach of morning, and amused me with his singular exclamations, sometimes sweeping down and around my fire, uttering a loud and sudden *Waugh O, Waugh O*, sufficient to have alarmed a whole garrison. He has other nocturnal solos, no less melodious, one of which very strikingly resemble the half-suppressed scream of a person suffocating or throttled." The writer first heard the wailing or groaning exclamation of this bird while he was accompanying a body of troops through a densely wooded country about midnight, for the purpose of surprising and capturing a Kandyan chieftain. The Kandyans consider the cry of this owl as a presage of death or misfortune, unless they adopt a charm to avert its fatal summons. They call this bird *Bagahmoona*, devil-face, or devil-bird, and by many the cry is presumed to come directly from the devil. The veracious Knox (who in 1681 published his excellent "Historical Relation of the Island of Ceylon") is obviously of this opinion, for he says, "This for certain I can affirm, that oftentimes the devil doth cry with audible voice in the night; 'tis very shrill, almost like the barking of a dog; this I have often heard myself, but never heard that it did anybody any harm. Only this observation the inhabitants of the land have made of their voice, and I have made it also, that either just before, or very suddenly after this voice, always the king cuts off people. To believe that this is the voice of the devil, three reasons urge; because there is no creature known to the inhabitants that cries like it, and because it will on a sudden depart from one place and make a noise in another, quicker than any fowl could fly, and because the very dogs will tremble and shake when they hear it, and it is so accounted by all the people.—*Marshall's Description and Conquest of Ceylon*, p. 13.

BENEVOLENCE is a duty. He who frequently practises it, and sees his benevolent intentions realised, at length comes really to love him to whom he has done good. When, therefore, it is said, "Thou shalt love thy neighbour as thyself," it is not meant thou shalt love him first, and do good to him in consequence of that love, but thou shalt do good to thy neighbour, and this thy beneficence will engender in thee that love to mankind which is the fulness and consummation of the inclination to do good.—*Emmanuel Kant*.

It is a hard and nice subject for a man to write of himself; it grates his own heart to say anything of disparagement, and the reader's ears to hear anything of praise from him.—*Cowley*.

Chepstow Castle.

FAMED—long famed—in the page of the picturesque—a locality in which artist and author love to linger, and apostrophized by the poet of nature,—

“O sylvan Wye! thou wanderer through the woods,”

the associations of the river are, unquestionably, heightened by the graceful memorials of the past which stud its banks. Among these, the ruins of Chepstow castle occupy an extensive area, adjoining the port and market town of Chepstow, on the Wye, about two miles and a half from where it falls into the estuary of the Severn.

The advantageous situation of the town, near the mouth of the Wye, is supposed to have rendered it a powerful position, both in Roman and Saxon times. However, the assemblage of natural and artificial beauties is of the most enchanting character; for the tourist, having passed the fantastic majesty of the Piercefield cliffs, capped with magnificent woods, finds himself in Piercefield Bay. “To the right, a line of perpendicular cliffs is still seen, but crowned instead of trees with an embattled fortress; which, for a moment, might seem to have been cut out of the rocks. The view is closed by a range of red cliffs, with the magnificent iron bridge of Chepstow spanning the river. This is the last of the great views on the Wye, and, if seen under favourable circumstances of time and tide, it is one of the finest.” (*“The Wye and its Associations,”* by *Leitch Ritchie.*) Another tourist describes the beauties as so “uncommonly excellent; that the most exact critic in landscape would scarcely wish to alter a position in the assemblage of woods, cliffs, ruins, and water.” Among these

features, the Wye and its banks are conspicuous. The ridge of cliff on the left bank below the bridge is remarkable both for its form and variety of colouring; while, on the opposite bank above, the gigantic remains of the castle, stretching along the brink of the precipice, give an air of romance to the picture, not frequently found in one of the crowded haunts of men. From different points, the views are exceedingly beautiful—the scenery not being surpassed, perhaps, by anything similar in Britain.

The bridge is a noble structure of cast iron, erected in 1816. It has five arches resting upon stone piers; but although, in reality, a massive structure, it has, when viewed from the river, that air of lightness which iron bridges usually possess. The old bridge was composed of a level floor, carried upon wooden piers, except in the centre, where a pillar of stone, dividing Gloucester and Monmouth, was the support. Afterwards, however, stone piers were substituted for those on the Monmouth side, before the two counties joined in the erection of the present handsome structure.

The castle of Chepstow is commonly stated to have been built originally by Julius Cæsar, a common paternity for old structures; in this case, ascribed only upon unauthorized assumption, fostered, though, perchance, by some idle or ill-informed topographer. For it is tolerably certain that Cæsar never was at Chepstow; and that Roman relics, although abundant in the neighbourhood, have never been discovered in the town. The plan and architecture of the castle, too, are of a much later date than the Roman dominion in Britain.

However, the name by which the town is at present known is Saxon, and denotes a place of traffic; and Leland traces at least its prosperity to its situation being favourable for commerce. "The town of Chepstow," says he, "hath been very strongly walled, as yet (the sixteenth century) doth appere. The walls began at the grete bridge over the Wy, and so came to the castel; the which yet standeth fayer, and strong, not far from the ruin of the bridge. A grete lyklyhood is, that when Carguen began to decay, then began Chepstow to flourish, for yt standeth far better, as upon Wy, there ebbing and flowing, by the rage coming out of the Severn, so that to Chepstowe may come grete shippes."

The ruins crown the brow of the precipice forming the right bank of the Wye, and the northern walls are close to the edge: the rest of the fortress being defended by a moat, and its own lofty towers.

The ground plan was divided into four courts. The first, which was entered by a Norman gateway, contained the great baronial hall, the vast kitchen, and apartments on a scale of considerable grandeur. At the south-eastern verge of this court is the keep, or citadel, now called Harry Marten's tower. The second court contains no architectural remains, except the walls: but in the third is a remarkable building usually designated "the chapel," and seeming to have formed one magnificent galleried apartment. The fourth court was separated from the rest by a moat, which was crossed by a drawbridge.

The building of the castle is ascribed, in Domesday Book, to William Fitzosborn, Earl of Hereford. It was inherited by his third son, Roger de Bristol, who was deprived of his estates, and condemned to perpetual imprisonment for rebellion. Of this fierce Norman baron, Dugdale has preserved the following characteristic anecdote:

"Though he frequently used many scornful and contumelious expressions towards the king, yet he was pleased, at the celebration of the feast of Easter, in a solemn manner, (as was then used,) to send to this Earl Rodger, at that time in prison, his royal robes, who so disdained the favour, that he forthwith caused a great fire to be made, and the mantle, the inner surcoat of silk, and the upper garment, lined with precious furs, to be suddenly burnt. Which being made known to the king, he became not a little displeased, and said, '*Certainly he is a very proud man who has thus abused me; but, by the brightness of God, he shall never come out of prison as long as I live!*' Which expression was fulfilled to the utmost, for he never was released during the king's life; nor after, but died in prison."

In the reign of Henry I., Chepstow Castle passed into the possession of the Clare family: of whom Richard de Clare was surnamed, like his father, Strongbow, and was famous for his Irish adventures. Espousing the cause of Dermot Maonagh, King of Leinster, against Roderic the Great, King of Connaught, upon the promise of Dermot's daughter for a wife, and his kingdom for an inheritance, the brave soldier landed at Waterford in 1174; married the princess; with 1200 men conquered the promised kingdom, and took possession of Dublin, the capital. This double fortune, however, so offended Henry II., that, in high dudgeon at this presumption of a subject, the king confiscated his estates, and carried an army over to Ireland, for the purpose of annexing Leinster to the English crown. Strongbow submitted; abandoned Waterford and Dublin to his feudal master; was restored to his estates, and made constable of Ireland.

By the marriage of Strongbow's daughter, (he having no male issue,) Chepstow Castle next came into the hands of one of the greatest men of his time, William, marshal of England, lord protector of the kingdom; and by the marriage of his daughter, (for although he had five sons they all died without issue,) it fell to Hugh Bigod, Earl of Norfolk. This daughter was Maud, remarkable for having, been in her widowhood created *marshal* in

virtue of her descent; the king himself, Henry III., solemnly giving the truncheon into her hand. She was buried in Tintern Abbey, in 1248, her body being carried into the choir by her four sons.

There is little worthy of record in the several changes of the possessors of Chepstow Castle, until it was sold to the Earl of Pembroke: whose heiress Elizabeth conveyed it by marriage to Sir Charles Somerset, afterwards Earl of Worcester. Churchyard records the fact of the sale in these uncouth rhymes:

"To Chepstowe yet, my pen agayne must passe;
When Strongbow once (an Earle of rare renowne),
A long time since, the lord and maister was
(In princely sort) of castle and of towne.
Then after that, to Mowbray it befall,
Of Norfolk Duke, a worthe known full well;
Who sold the same to William Harbert, knight,
That was the Earle of Pembroke then by right."

We now approach a passage of more stirring interest in the history of the fortress.

Early in the civil wars, Chepstow was garrisoned for the king: until, in 1645, Colonel Morgan, governor of Gloucester, at the head of 800 horse, and 400 foot, and assisted by the mountaineers, with little difficulty made himself master of the town: and, in a few days, compelled the governor, Colonel Fitzmorris, to surrender the castle. But the fortress was afterwards surprised by the Royalists, under Sir Nicholas Hemys, who, in the absence of the governor, by means of a secret correspondence, obtained possession of the western gate, and made the garrison prisoners of war. On this event, Cromwell marched against it in person, took possession of the town, but assailed the castle without success, though garrisoned only by 160 men. He then left Col. Ewer, with a train of Artillery, seven companies of foot, and four troops of horse, to prosecute the siege. The garrison, however, held out valiantly, until the provisions were exhausted: and even then refused to surrender under promise of quarter, hoping to escape by means of a boat which they had provided for that purpose. A soldier of the parliamentary army, however, swam across the river, with a knife between his teeth, cut the cable of the boat, and brought it away: the castle was at length forced, and Sir Nicholas Hemys and forty men slain in the assault. This event was considered by the parliament so important that the captain who brought the news was rewarded with fifty pounds; and a letter of thanks was sent to Col. Ewer, and the officers and soldiers engaged in that service.

In 1645, the castle, with the other estates belonging to the Marquis of Worcester, were settled upon Oliver Cromwell: but were given back to the Worcester family at the Restoration.

Next comes a tale of captivity in the castle, which for a long period was regarded as a political martyrdom. The sufferer was Henry Marten, one of the judges of Charles I., who was confined here twenty years after the Restoration.

Marten appears to have been one of the most zealous opponents of royalty. He does not seem to have been himself of irreproachable character, if we may credit Anthony Wood, who relates that, "being authorized by Parliament, about 1642, Marten forced open a great iron chest within the college of Westminster, and thence took the crown, robes, sword, and sceptre, belonging anciently to King Edward the Confessor, and used by all our kings at their inaugurations." With these regalia, Marten, in the recklessness of scornful humour, invested George Wither, the Puritan satirist, who, thus crowned and royally arrayed, exhibited himself to the bystanders.

Yet Marten was a member of the High Court of Justice, regularly attended the trial of Charles, was present when the sentence was pronounced, and signed the death-warrant. A shameful story is also related of Cromwell and Marten, when about to sign, spattering ink over each other! However, these two worthies quarrelled at last; Marten opposing Cromwell's ambi-

tion to become king, saying, "if they must have a king he had rather have had the last than any gentleman in England; he found no fault in his person, but in his office."

After the Restoration, Marten surrendered, with other regicides, to the king's proclamation. He was condemned to perpetual imprisonment, and was removed from the Tower to Chepstow Castle. Here he was treated with lenity; was permitted to spend his property as he pleased; to enjoy the society of his wife; to receive visits, and even to return them in the neighbourhood, accompanied by a guard. He died of apoplexy, in the twentieth year of his confinement, and seventy-eighth of his age. He was buried in the chancel of the parish church at Chepstow. Hence the following passage is a poetical exaggeration:—

"For thirty years, secluded from mankind,
Here Marten lingered. Often have these walls
Echoed his footsteps, as with even tread
He paced around his prison. Not to him
Did nature's fair varieties exist;
He never saw the sun's delightful beams,
Save when thro' yon high bars he pour'd a sad
And broken splendour."

The thirty years must be diminished to twenty; and the seclusion from mankind must be understood to be as easy as captivity would permit. This explanation may abate the tourist's anxiety to read Marten's epitaph, written by himself, and freshened, by order of the churchwardens, in 1812; but, *magna est veritas, et prevalebit*.

The castle remains are now, as our engraving shows, a picturesque but crumbling group; intermixed with foliage and clustering evergreens, mantling the decay of art with the luxuriance of nature. In June last, the Chepstow Horticultural and Floricultural Show was held in the courts of the Castle, in which were gaily decorated tents and brilliant displays of flowers. "The effect," says a report of the fête, "was enchanting and magical. Indeed, the foregone associations connected with the spot chosen by the committee, viz. the castle, for the exhibition; the contrast of its modern uses to its primitive intentions, when each massive tower bade defiance to its hostile intruder; when the eastern portal was defended by two massive latticed gates, iron bolted and bound, and by two ponderous portcullises; as a whole, the gay scene could not be contrasted with the past but with reflections of the most pleasurable nature." This, in truth, were a much fitter subject for the muse than Marten's captivity!

THE MERCHANT.¹

CHAP. V.

THE merchant had not yet visited all his friends, and he wandered away by himself in the direction of a little thatched cottage on the borders of the common. Some yew trees, trimmed in grotesque shapes, formed an archway over the entrance into the garden, which was in perfect order. The most scrupulous cleanliness and neatness reigned within and without this little abode, and were equally remarkable in the person of its proprietor, an old, attenuated, wrinkled dame, in closely-crimped cap and folded kerchief, who sat in a wicker chair, so placed as to afford her a view of her garden and gate. Neville cast a look around, which was evidently not the scrutiny of a stranger, but that of one who was seeking familiar things. The old woman, whose curiosity was easily stirred, cried: "Won't you walk in, sir, and gather some flowers?"

Neville silently accepted the invitation, and entering

the garden picked some rich, dark wall-flowers as he passed them.

"Hester," he said, as he stood beside the old woman's chair; "you do not recollect me?"

"No, indeed, sir, I don't," she replied, after steadfastly surveying him.

Neville smiled, but it was mournfully.

"Bless me!" cried the old woman, resting her hands on her knees, and gazing up in his face; "there certainly is something in your smile that I ought to know."

"Indeed there is, Hester; and my name you cannot have forgotten,—it is Neville."

"Neville!—Is it possible?—You are Mr. Edmund, then. That ever I should live to see it! My poor young mistress! Ah! Mr. Edmund, how little did you or I think that you would come back to find this poor old withered body, and not to find her!" And she raised her bony hands to her face, and was for a while overpowered with the painful recollections which his presence awakened in her.

Neville was silent. His companion never was so for many minutes together, so she now recommenced:—

"When you stopped at my gate, I felt, I don't know why nor wherefore, for you are altogether changed, Mr. Edmund, that it was no stranger that was there. Now, if Miss Juliet had come down to me, as she often does, and said, 'Mr. Edmund is coming home, Nurse, I might have fancied that old times were come back again,—for she is just my young lady to my eyes.'"

Neville started. How chanced it that his own wild thoughts were the first that found utterance from the lips of her whom he sought that he might learn the history of the past? He conquered his agitation, and replied:—"Hester, I should think that you could tell me as much of what passed after my departure as any one can."

Now perhaps it may seem strange that Neville thus sought the side of this aged rustic to listen to facts and comments,—nay, more,—to give utterance to feelings,—all of which he would hush to silence in the intercourse between himself and Markham. Why does he feel it more endurable to listen to her unhesitating rehearsal, in her common phraseology, of circumstances which Markham would tremble to make known in the most guarded terms? There is something in the simplicity with which the poor mention the most startling and heart-breaking truths, which has a less painful effect than the timid allusions made to them by the more educated. Again and again the old woman touched on the likeness which his friend's daughter bore to her who should have been his bride, and declared that the likeness was borne out in her sweet and gentle temper; and Neville felt, that again and again could he return to her cottage, to hear her pursue the same theme. At length he said:—

"She seems to me more grave and silent than—than is natural at her age."

"Aye, indeed, she was blithe enough when you were here;—but, Mr. Edmund, if you had come a few months ago, you would not have had occasion to complain that Miss Juliet wanted life;—no, indeed. It did me good to see her coming with her merry laugh, that I was sure to hear before she was in sight; but now I watch her creeping along the common; and once, I declare, she passed the very gate, not knowing it, and turned back again with a start. Oh! it is a sad thing to see her; and enough to make your heart ache! She looks so like her who went before her, that I can't but think she's a-going the same way!"

Neville gave a deep sigh.

"What ails her, Nurse?—Do they not mark this change, and care for her health?"

"What ails her! Ah! Mr. Edmund, what is it that ails young folk?—You have not yet forgotten! But the other day she was standing just where you stand, looking so pale and sad—and I said to her: 'Don't let things press too heavily on your young heart; pray

don't!" In a moment she was as red as that damask rose, and she cried: "What do you mean, Nurse? Nothing presses on my heart." But I know very well that there does."

"Tell me all you know, Hester. I don't ask from curiosity."

"But here she comes herself, sir;" and Juliet was within a few steps of the gate. Her arrival entirely changed the nature of the discourse. A few kind and cheerful words passed between her and Hester, and then she left the cottage, accompanied by Neville.

"I hope Hester is a favourite with you all," he said. "She stands high in the list of the few friends England has to afford me."

"Oh, yes, we all love her for her warm heart, and for a cheerfulness and merriment which one little expects to find at her age, and not often in her class. I don't think such gaiety is common among the poor; I suppose hard toil and hard fare wear down their spirits, and of the first Hester has had her share. Whenever we come to see her, however sick or weary we find her, she is always full of life before we quit her."

"You," said Neville, in a low voice, "must be especially dear to her, not only for your own sake, but for the sake of one whom she sees again in you."

He felt as if, in painfully uttering these words, he taught Juliet to expect from him that deep and fervent love which filled his heart, and revealed to her the necessity of its existence; and so to have done was some relief.

CHAP. VI.

NEVILLE, during the remainder of their walk, was as abstracted and spiritless as Juliet in her most dejected moments. She attributed his sadness to the remembrances of the past brought before him by the old domestic with whom he had been conversing, and she was deeply touched and interested when she perceived that years had not impaired his constancy, nor chilled his affections. She was inclined to muse on what seemed to her, smarting from recent disappointment, almost a phenomenon. She could not consider this faithful love without a disposition to repine, for she deemed his sufferings, bitter as they were, in nature preferable to those which she had undergone. Absorbed in these reflections, she walked sadly and silently by his side, little aware how much his thoughts were occupied by her; at length she felt that his eyes were fixed on her face, and that tears were stealing down her cheek. She turned her head away hastily.

"Juliet," said Neville, kindly, "surely I am a very old friend, if a very new acquaintance. There need no preliminaries to intimacy between us. Let me speak to you henceforth always in the former character. My first visit to your home must soon end. Impatience to see my dearest friend brought me here in such haste that I must depart again with no less speed; but I would, before I go, speak to you on subjects with which no stranger intermeddled. Why should I speak to you as a stranger, Juliet,—to you, the child of my friend, and far more to me than that alone could make you. I have returned to England, Juliet, without relations, without friends; I bring with me princely wealth, and my chief object is to advance the interests and the happiness of my friend's children. I came here hoping to find no uneasiness that I could not remove. I discover it where it grieves me most to see it. From your own lips I would learn if I can do anything to promote your happiness."

Juliet made no reply, nor raised her eyes to his. She turned very pale, and trembled violently. Neville, in some alarm, drew her arm within his, exclaiming:—

"I have been too abrupt where I should have spoken most guardedly. Do not try to answer me, Juliet! Only think on what I have said, and communicate your wishes to me in any way you like. Consult with your parents; and let your father speak with me. All that I

ask from you is candour, and believe me that to serve you will be the utmost happiness I can know."

Juliet strove to speak, but could not. The anguish of her countenance betrayed no common grief, and deeply distressed her companion.

"I will not leave you till you reach home," he said, in tones of regret and self-reproach, and they moved slowly down the shady lane which led to the Grange. When within a short distance from the house, Juliet began in a low voice, which trembled at first, but grew firmer as she went on:—

"Mr. Neville, I cannot part from you without saying a few words in reply to an offer of such unbounded generosity and kindness. I feel indeed that you are no stranger to us in heart, and I will show you the candour you desire. The grief which you have marked in me is one which no remedy which you can propose could possibly remove. Pray forget its existence, and never recur to it again."

"I cannot bear to see you as you are, Juliet," said Neville, in a tone of deep feeling.

"Nor shall you," replied Juliet, with a dignity beyond her age. "I have said that you can do nothing for me, but I can do much for myself, and with the aid of Heaven, so I will. I will not long sadden those who love me by outward dejection."

"Nay, Juliet," interrupted Neville, glancing with alarm at her slight form and pallid cheek, "tax not your strength too severely."

"I am much better than I have been," she said, in her former tremulous tone, and for the first time a flood of tears came to her relief.

"Oh, Juliet! if, on further deliberation——"

"Urge me not, urge me not," exclaimed Juliet, vehemently. "You tempt me—and it is to certain misery!"

These mysterious words ended their discourse. She hastily opened the gate of the shrubbery, and, pointing out to Neville a path which led to the house, she abruptly turned into another.

CHAP. VII.

NEVILLE did not ask himself directly, whether any secret joy mingled with the pain which it cost him to see his scheme for Juliet's happiness overthrown. He soon forgot himself to think solely of her, and the compassion which such thoughts awakened led him back again to his generous projects. As he passed the evening with his friend, he could not abstain from approaching the subject, and at length he repeated to him all that had passed. Mr. Markham's eyes glistened as he heard him; joy beamed in them though they swam with tears.

"She is a matchless girl!" he exclaimed, with irrepressible emotion. "She is the most high-minded, the noblest creature! She speaks truly," he continued, after a pause, with more calmness. "Juliet has a natural energy which will not allow her to remain downcast. She has many to love, and she has many duties to perform, and she does perform them with all the ardour of an affectionate heart and a high spirit. I trust confidently that there is enough around her to enable a strong mind in all the vigour of youth to rally from deeper affliction than hers has been; for, though bitter, it is not of a nature to be lasting. Still I confess that to see, as we do at present, resignation holding the place of happiness, is a spectacle which touches us deeply."

"But must this be?" cried Neville. "Can nothing be effected to restore the latter?"

Mr. Markham extended his confidence further, and related these facts to his friend. The former incumbent of the living now held by Mr. Villiers, (and the resident at the Rectory, so near to the Grange,) had been a man of good education and considerable abilities, who eked out a scanty stipend by preparing young men for their entrance into the Universities. These so-called pupils enjoyed, however, the main disposal of their own time, and profited as little or as much as pleased themselves

by the powers of instruction certainly possessed, but not certainly exerted, by their tutor. Among those entrusted to his care, was the son of a great man, at least in his own estimation very great, for Sir Ralph Harvey was a man of very old family, and of unbounded pride, though by no means superabundantly wealthy. His son Lyttelton Harvey was handsome, impetuous, evidently headstrong, apparently resolute. His society was generally fascinating to those of his own age, it was especially so to the young and lovely girl whom he felt impelled to please by every means in his power. In a short time he was Juliet's passionate adorer. Mrs. Markham was not a very wise woman, Mr. Markham not a very prudent man—at least so Neville gathered from the rumours he heard. The first built castles in the air, and both of them founded on earth; the second did not regard the danger till the evil was accomplished. The first behaved like a man of honour and of resolution. He rebuked Lyttelton of his youth; he forbade his visits to his house; he referred him to his father for a sanction of his passion, to time as a test of his earnestness. In consequence of these injunctions, he discovered that Lyttelton was rather rash than resolute. His arbitrary father had been from his earliest years the object of his fear, and he quailed in his presence, though, apart from him, he boasted of independence. Time also led him to consider that it was not wise for a man so young, and born to such hereditary honours, who might command a choice of the beauty, or rank, or wealth of England, to ally himself with one as destitute of the two more solid advantages as she was richly endowed with the first, and with "all with which Nature halloweth her daughters."

He began to acquiesce in the superior wisdom which had withheld him from carrying out a rash purpose, and, though he blushed to avow the complete change, he went so far as to inculcate resignation to Juliet, and to evince that he was an apt scholar in the lesson he taught. Juliet was quicksighted, and had more than a common dignity and delicacy of perception. She recognised the alteration, and, smarting under the grief and the humiliation, she made it clearly known to Mr. Lyttelton Harvey, that she fully appreciated the wisdom of her father's conduct, and the meek submission of his own. She returned some foolish tokens which were to have lived with her in life, and to have lain with her in the grave. Life is short, but we outlive many things which had a promise of durability. Mr. Lyttelton Harvey returned no more. It was almost equally fortunate for Juliet that Mr. Halifax, his tutor, departed soon afterwards, giving place to Mr. Villiers. The advantages which Juliet derived from this change were not confined to those which he conferred on her by his full and excellent discharge of all the pastor's duties. He brought with him to the rectory a sister whose whole life had been passed in his home; one who was endeared to him not only by her devoted love and excellent qualities, but by being one of those doomed to pain which admits of little alleviation from human skill,—set apart to serve in suffering,—a spectacle involved in mystery, and never to be looked on but with awe. Miss Villiers became to Juliet the best and wisest of earthly friends. To a heart of peculiar tenderness she joined the most enlightened and impartial views of life. Her understanding was highly cultivated, her judgment sound, her penetration acute, and her sympathy lively. Beside her couch Juliet spent many hours, and none without learning some lesson of high import. She had already regained her calmness; for cheerfulness she was yet striving. The strength of her resolution had this day been tested, and her father rejoiced to find that it had withstood all temptations to strive to win back what he esteemed well lost. He was convinced that Juliet's happiness could not be secured by the recall of her youthful lover. Whether this truth was equally impressed on the mind of his wife he somewhat doubted, and, though she offered no contradiction to his comments on the facts

which he communicated to her that night, she fell asleep and dreamed that she saw Lyttelton Harvey repentant at the feet of her pale child; and, before it was clear whether she would spurn him from her with majestic scorn, or whether she would melt into forgiveness, she awoke again to contemplate what she considered as sober certainty, Juliet's future endowment with at least a vast portion of the merchant's wealth.

FRANK FAIRLEIGH;

OR, OLD COMPANIONS IN NEW SCENES.

BY F. E. S.

CHAP. X.

TAMING A SHREW.

"Why did you prevent me from giving that insolent scoundrel the lesson he deserved?" was Oaklands's first observation as we left the quadrangle in which Lawless's rooms were situated; "I do not thank you for it, Frank."

"My dear Harry," replied I, "you are excited at present; when you are a little more cool, you will see that I could not have acted otherwise than I did. Even supposing I could have borne such a thing myself, what would have been said of me, if I had allowed you to fight in my quarrel? no honourable man would have permitted me to associate with him afterwards."

"But I don't see that the quarrel was yours at all," returned Oaklands; "your share of it was ended when the toast affair came to a conclusion; the rest of the matter was purely personal between him and myself."

"How can that be, when the origin of it was his doubting, or pretending to doubt, the truth of the anecdote which I related?" inquired I. "No; depend upon it, Harry, I have acted rightly, though I bitterly regret now having gone to the party, and so exposed myself to all this. I have always looked upon duelling with the greatest abhorrence; to run the risk of committing murder, for I can call it by no milder name, was, at the very moment in which the crime is consummated, you may fall yourself, and thus even the forlorn hope of living to repent be cut off from you, appears to me little short of madness. On one point I am resolved,—if I do go out with him, nothing shall induce me to fire at him; I will not die a murderer, at all events."

"Should your life indeed be sacrificed," said Oaklands, and his deep voice trembled with emotion as he spoke, "I will follow this man as the avenger of blood, fix a mortal insult upon him wherever I meet him, and shoot him like a dog, convinced that I shall perform a righteous act in so doing, by ridding the world of such a monster!"

I saw by his manner, that it would be useless to attempt to reason with him at that moment,—his warm feelings, and the fiery, though generous, impulses of his impetuous nature, had so completely gained possession of him, that he was no longer a reasonable creature,—we therefore walked in silence to my rooms, where we parted; I declining his offer to remain with me till I should learn the decision of Lawless and his friends, on the plea of wishing to be alone, (which was, indeed, a true one,) although my chief reason for so doing was to prevent the possibility of Oaklands saying anything in his present excited state of mind, which, if repeated, might in any way involve him with Wilford.

My first act, when I found myself once more alone, was to sit down and endeavour calmly to review the situation in which I was placed. In the event of their deciding that the shrew might be removed, naturally, my course was clear,—I had only to wait, and as much as possible during the time I remained at

Cambridge, and, if ever I were obliged to be in his company, to treat him with a cool and studied civility which would leave him no pretext for forcing a quarrel upon me. On the other hand, if they should think it imperative upon me to go out with him, then indeed was the prospect a gloomy one. Wilford, whose ruthless disposition was so well known as to have become as it were a by-word among the set he mixed with, was not a man to be offended with impunity, and as, moreover, I had made up my mind not to return his fire, the chances were strongly against my escaping with life.

I am no coward ; on the contrary, like most men whose physical energy is unimpaired, I am constitutionally fearless, and in moments of danger and excitement have never found myself wanting ; still it would be affectation to deny that the prospect of a sudden and violent death, thus unexpectedly forced upon me, impressed my mind with a vague sensation of terror, mingled with regret for the past, and sorrow for the future. To be thus cut off in the bright spring-time of vigorous manhood, when the warm blood of youth dances gladly through the veins, and every pulse throbs with the instinct of high and noble daring—to die with hopes unattained, wishes ungratified, duties unperformed,—to leave those we love, without one parting look or word, to struggle on through this cold unsympathizing world alone and unprotected,—and, above all, to lose one's life in an act the lawfulness of which was more than questionable,—all these things contributed to form a picture, which it required either a very steadfast, or an utterly callous heart, to enable one to gaze upon without quailing. I thought of the misery I should entail upon my family ; how, instead of fulfilling my father's dying injunctions to take his place, and devote myself to comfort and protect them, I should wound my mother's heart anew, and spread the dark mist of sorrow over the fair prospect of my sister's young existence ; and I cursed my fastidious folly in objecting to the toast, to which, in my self-accusation, I traced all that had afterwards occurred. Then, with the inconsistency of human nature, I began to speculate upon what would be Clara Saville's feelings, were she to learn that it was to prevent the slightest breath of insult being coupled with her name, that I was about to peril, not only my life, but, for aught I knew, my hopes of happiness here and hereafter. As the last awful possibility occurred to me, the burden of my misery became too great for me to bear, and, retiring to the privacy of my own chamber, I flung myself on my knees, and poured forth an earnest prayer for pardon and assistance.

When I again returned to my sitting-room, my mind had nearly recovered its usual tone, and I felt prepared to meet and to go through whatever might be before me, with calmness and determination. As I was uncertain how long it might be before Lawless would arrive, I resolved, in order to avoid the horrors of suspense, to employ myself, and taking up the mathematical treatise upon which I was engaged, and by a vigorous effort of mind compelling my attention, I read steadily for about half an hour, at the end of which time the sound of hasty footsteps was heard ascending the stairs, and in another minute the door was flung open, and Lawless and Archer entered the apartment.

"Reading mathematics, as I'm a slightly inebriated Christian!" exclaimed Archer, taking the book out of my hands; "well, if that isn't pretty cool for a man who may be going to be shot at six o'clock to-morrow morning, for anything he knows to the contrary, I'm no judge of temperature."

"Oh! bother mathematics," rejoined Lawless, flinging the book which he was holding at a bust of Homer standing in the hall, "which it is not my business to know anything about. All right—now, what is the subject of this thing this time—the one that is to be read about it?"

"Drunk punch enough to floor any two men of ordinary capacity," interposed Archer.

"Of course I have," continued Lawless, "and I consider I've performed a very meritorious act in so doing;—there was the punch, all the other fellows were gone away, somebody must have drunk it, or that young reprobate Shrimp would have got hold of it, and I promised the venerable fish-fag his mother to take especial care of his what do ye call 'ums—morals isn't it? and instil by precept, and—and—"

"Example," suggested Archer.

"Yes, all that sort of thing," continued Lawless, "a taste for, that is, an unbounded admiration of, the sublime and beautiful, as exemplified under the form of—"

"Rum punch, and lashings of it," chimed the teacher; "but suppose you were to tell Fairleigh what has been going on since he came away, or let me hear from you, whichever you like best."

"Oh! you tell him, by all means,—I like the ingenuous youth; fire away, Archer, my boy."

Thus urged, Archer informed me, that when the departure there had been a somewhat stormy one, in which the events of the evening were freely canvassed; and, at last, they came to a unanimous decision, that any man was at liberty to withdraw if he was proposed to which he objected, and that the master preferred giving it up rather than to leave the party, he had a perfect right to do. In being the case, they agreed that Wilford, having been in the wrong, ought to confess that he had spoken hastily, and that, if he would do so, and would add that he had meant nothing offensive either to me or Oaklands, there the matter might rest. This for a long time he positively refused to do; at length, finding he could get no one to support him, he said, that as I had owned I was wrong in attempting to prevent his expressing his opinion, as to whether Lawless should give up the toast or not, he considered that, in all other respects, I had behaved in a gentlemanly way; therefore, if he had said anything which implied the contrary, he was willing to withdraw it. But that, as regarded Mr. Oaklands, he thought he had interfered in a very uncalled for manner, and he could only repeat that, if that gentleman felt himself aggrieved by anything he had said, the remedy was in his own hands. As soon as he had spoken he withdrew.

The question was again debated, and at length they came to the conclusion, that what Wilford had said amounted to an ample apology as far as I was concerned, which I was bound to accept; and that Oaklands, having agreed to consider the quarrel mine, could not take any further notice of it, therefore the affair was at an end.

"Well," said I, as he finished his recital, "I must ever feel grateful to you both for the trouble you have taken on my account, and the kind feeling you have shown towards me throughout. I will not pretend to deny that I am very glad the matter has been amicably arranged, for, circumstanced as I am, with everything depending upon my own exertions, a duel would have been ruin to me; but I must say, I think the whole business thoroughly unsatisfactory, and it is only my conviction that a duel would make matters worse, instead of mending them, which leads me to agree to the arrangement. I sincerely hope Oaklands will not hear what Wilford said about him, for he is fearfully irritated against him already."

"I'll tell you what it is," interrupted Lawless; "it's my belief that Wilford's behaviour to you to-night was only assumed for the sake of provoking Oaklands. Master Stephen hates him as he does the very Old Gentleman himself, and would like nothing better than to pick a quarrel with him, have him out, and, putting a brace of slugs into him, leave him—"

"Quivering on a daisy," said Archer, completing the sentence. "Really I think," he continued, "what Lawless says is very true; you see Oakland's careless, nonchalant manner, which is always exactly the same

whether he is talking to a beggar or a lord, gives continual offence to Wilford, who has contrived somehow to exact a sort of deference and respect from all the men he associates with, till he actually seems to consider it his right. Then, Wilford's overbearing manner irritates Oaklands, and so, whenever they have met, the breach has gone on widening, till now they positively hate one another."

"How is it you are so intimate with him?" asked I; "for nobody seems really to like him."

"Well, hang me if I can tell," replied Lawless; "but you see he has some good points about him, after all; for instance, I never saw him out with the hounds yet, that he didn't take a good place, aye, and keep it too, however long the run, and difficult the country. I killed my best horse I had in my stables, trying to follow him one day in Leicestershire last season; my horse was with me, going over the last fence but one, and he was again. Wilford and one of the whips who were only a feather-weight, were the only men in at the post. I offered him 300 guineas for the horse he rode, but he only gave me one of his pleasant looks, and said he wasn't for sale."

"You've seen that jet black mare he rides now, haven't you, Fairleigh?" asked Archer.

"What a magnificent creature it is," was my reply. "I never hear how he came by it?"

"Answering in the negative, Archer continued,

"Well, I wonder at that, for it was in everybody's mouth at one time: it's worth hearing, if it were but to show the determined character of the man. The mare belonged to Lord Foxington, Lord Sollborough's eldest son; I believe he gave 500 guineas for her; she was a splendid animal, high couraged, but temperate; in fact, when you were on her, she hadn't a fault; but in the stable she was a perfect devil; there was only one man who dared go near her, and he had been with her from a filly: so that, when Foxington bought her, he was forced to hire the groom too. The most difficult thing of all was putting on the bridle; it was generally half an hour's work before she would let even this groom do it. After dinner, one day, Foxington began talking about this animal, saying what a brute she was to do anything with, and adding what I have just told you, as to the impossibility of putting on the bridle, when Wilford, who was present, made some remark, which showed he did not believe in the impossibility; upon which Foxington inquired whether he doubted the fact he had just heard."

"Wilford replied, that he did not doubt his lordship fully believed in the truth of what he had just stated, but, for his own part, he had so often found impossibilities of this nature yield to a little courage and determination, that he confessed he was somewhat sceptical."

"Now it so happened, that Foxington, soon after he bought the mare, had thought just as Wilford did, and determined that he would put the bridle on; accordingly he attempted it, and the matter ended by his getting regularly driven out of the stable by the animal, with a tolerably severe bite in the fleshy part of the shoulder. Wilford's remark, therefore, as may be imagined, rather nettled him, and he inquired somewhat tartly, whether Wilford believed he could put the bridle on? and if so, whether he was willing to try?"

"Wilford replied in his usual cool tone, that he had very little doubt he could do so, but that he had no particular inclination to try, as it would probably be some trouble, and the weather was too hot to render active exertion desirable."

"At this Foxington laughed derisively, saying, that it sounded very like a put off."

"Not at all," returned Wilford; "and to show you that I never say a thing without being ready to act up to it, I am willing to stake 500 guineas against the mare herself, that I go up to her, and put the bridle on, without any assistance, and without a stick, or anything whatsoever in my hands."

"Foxington accepted the bet gladly, reckoning himself safe to pocket the 500 guineas. The affair was to come off the next morning at Foxington's stables at eleven o'clock. His lordship had invited all the men who had been present when the bet was made, to come and witness the event, expecting a complete triumph over Wilford. While they were standing about, waiting, Foxington told them of his own attempt, and his conviction, from the experience he had then gained, that the thing could not be done, and the general opinion was that Wilford, under the influence of wine, had foolishly boasted of what he would not be able to accomplish, and was certain to lose his money. As the time drew near, and he did not make his appearance, an idea began to gain ground that he meant to shirk the thing altogether, and Foxington was becoming exceedingly irate, when, just as the clock was on the stroke of eleven, the sound of a horse's feet was heard, and Wilford cantered quietly up, looking as if he felt no personal interest whatever in the event. On his arrival they proceeded at once to the stable in which the mare stood. She was kept in a loose box, with her clothes on, but her head entirely free."

"I ought, by-the-by," said Archer, interrupting himself, "to have told you, that I had the account from a man who was there the whole time, and saw it all. Well, as soon as they went into the stable, the mare left off feeding, and turning round so as to face them, stood with her ears pricked up, gazing wildly at them."

"Wilford just glanced at her, and then leisurely divested himself of his coat, waistcoat, and neckcloth, turned up the wristbands of his shirt, and taking the bridle from the groom, announced that he was ready. As soon as the door was open, Wilford fixed his eyes sternly on the mare, and walked towards her;—to the surprise of every one, the animal allowed him to approach quietly, and pat her, without showing any symptoms of vice; men began to exchange inquiring glances with each other, and those who had betted heavily against him trembled for their money, but Foxington, who was better acquainted with the animal, exclaimed,

"Wait a minute, he has not tried to touch her head yet."

"Wilford now moved his hand forward along the neck, patting her, and speaking soothingly to her, as he advanced; but, as he approached her head, she became impatient and fidgety, and when he attempted to take hold of the ear, in order to put on the bridle, she flung up her head, reared, and ran back a few steps, where she stood, shaking her mane, and pawing the ground. After remaining in this position a few seconds, she suddenly laid back her ears, and showing the whites of her eyes, ran at Wilford with her mouth wide open, and as soon as she got within distance made a furious bite at him. By springing on one side with great agility, he just contrived to avoid it, then, dropping the bridle, he threw himself into a sparring attitude, (you know he's a capital boxer,) and, as the mare again ran at him, hit out, and striking her just on a particular spot by the ear, brought her down like a bullfinch. As soon as she recovered her legs she renewed the attack, and Wilford received her as before, delivering his blow with the same coolness and precision. When the animal rose the second time, she seemed partially stunned, and stood for a moment with her head hanging down, and her ears drooping; but on Wilford's making a step towards her, she again plunged forward, and attempted to seize him with her teeth. Once more did Wilford evade her bite, by springing on one side, and seizing his opportunity, succeeded in planting his hit, and for the third time felled her to the ground. When she again rose, however, she showed no disposition to renew the attack, but stood trembling violently, with the perspiration running down her face. She now allowed Wilford to approach her, to stroke her head, pull her ears, and finally to put the bridle on, and had her out completely conquered; and at my Lord's

ington lost the best horse in his stables, and Wilford gained his bet, and added to his character for invincibility, which, by the way, he cared about much the most."

"It was a bold deed," returned I, as Archer concluded his story, "but one does not like the man the better for having done it; there seems to me a degree of wanton cruelty in punishing an animal so severely, unless he had been actually forced to do it; public executioners may be necessary for the prevention of crime, but that is no reason why one need volunteer as an amateur hangman."

"Everybody thought it a very plucky thing at the time, and there was an immense fuss made with him afterwards," replied Archer.—"Why Lawless, are you asleep? rouse up man—to bed—to bed.—Good night, Fairleigh, you'll sleep all the better for knowing you are not to be shot at cock-crow."

No saying he took Lawless by the arm and marched him off, though it must be confessed, his gait, as he descended the stairs, was somewhat unsteady.

TRUTTA.

Translated from the German of Langbein.

At the time when Doctor Faust rode out of Auerbach's cellar in Leipzig on the wine cask, there lived there a celebrated merchant named Altmayer, the worst of whose possessions was his only son. His father's wish of making him a clever active man of business failed entirely. He devoted himself, it is true, to Mercury, but not as the God of commerce, but as the God of thieves, for it is well known, that the messenger of the Gods was not only the protector and patron of the latter, but that he was not quite free from the imputation of pilfering himself. His example was followed by Valentine Altmayer; and he, like his master, conducted his affairs with becoming decency. Stranger's goods were perfectly safe with him; he touched none but his father's property, because he considered himself as already joint possessor, and looked upon these secret purloinings as a lawful fore-enjoyment of his future inheritance.

What he obtained in this manner he did not employ like the saint who stole leather to make shoes for the poor, but he spent it in low houses, among a set of young men of his own stamp, who, by their profligacy, were very likely to be shortly without shoes to their feet. He lavished the produce of his robbery in every kind of dissipation. His father, who soon found out his bad practices, broke many a stick on the hopeful staff of his old age, and as this had not the desired effect, he procured him admittance into the house of correction, where he cooled his blood, which had been heated by strong wine, with cold water, and restored the healthy tone of his stomach, which had been injured by savoury viands and pastry, by a wholesome change of care.

After he had passed six months here, and showed much sorrow and repentance, his father pardoned him, and took him home. "But what shall I do with you now?" said he, "you are too stupid for commerce."

Valentine reddened, and muttered between his teeth.

"Yes! yes! too stupid," said his father, "for I call it the height of stupidity for a man not to use all his endeavours to get on in the world."

"Well then, let me be a student," said Valentine insolently.

"You are right! That is the surest way not to get on," said his father; but the proposal met his approbation, because, like many others, he was of opinion that a good for nothing, useless fellow, would always be cunning enough to be a learned man. But when, on being questioned what he would study, Valentine declared for the law.

Here Altmayer shook his head, and said, "That will never do for you; a lawyer's business is much too important. It concerns money and property, and if, as an advocate, you should lose a law-suit, you will have to pay the costs, and will injure yourself for ever. You had much better turn your attention to physic; there is less harm to be done there.—All men must die once, and if by your quackery, you send an invalid or two out of the world a little sooner than they should, what does it signify? no one will care, and your fault will be honourably buried."

Valentine, whose only concern was for the title and freedom of a student, made no objections, and he was enrolled in the list of students. He passed some time in the different lecture-rooms, but dry study did not please him. The noble vapour of the wine cellar suited him better, and for some time he lived more under the earth than upon it.

It so happened, that when Doctor Faust performed his extraordinary feat on the wine cask, which has been celebrated by Goethe in his Faust, our Altmayer was present in Auerbach's wine cellar. He is immortalized by having been one of the jovial guests who arrogantly presumed to insult the doctor, who punished their insolence by turning them all into ridicule with a delusion of the black art.

"Slowly before their wondering eyes,
A vineyard, fruitful with delicious grapes, arose.
Eager to make the juicy prize their own,
Each seized his knife. When, lo! it
Like to the glittering soap bubbles,
Which children strive with earnestness to blow,
Then laugh to see them burst,
The glorious vision vanished.
And—oh, indignity unheard of! each held within his grasp,
Ready to be lopped off—his neighbour's nose."

The drunkards started back in astonishment, and Faust rode away on his cask.

This piece of magic pleased young Altmayer extremely. He thought that he who could do such things, could certainly change sand or stones into gold, and that this knowledge would be well worth learning. So he instantly determined to become the pupil of this wonderful man. He inquired for his dwelling, and instantly went there. In the anteroom he found the well known Famulus Wagner, and Faust's usual companion, a large black dog, in whom a powerful spirit, or perhaps the devil himself, was said to dwell. Valentine made him a deep obeisance; but the animal did not accept this civility very graciously, he growled and showed his teeth. Wagner pacified him, but more with entreaty than command, and then asked Altmayer what he wanted.

"I wish to learn the art of making gold," said he, "and I would speak with the doctor about it."

(1) The author has been credibly informed, that the feat here ascribed to Wilford, was actually performed by a person employed in the stables of the late Lord S———, not many years since, and that the horse, previously to performing the feat, was completely trained to the performance.

Trutia.

"If you seek my master for nothing else," said Wagner, "you will find no learning. He will not condescend to discover the philosopher's stone to unworthy men, who would only become rich to pass their days in idleness. And that such is your wish is written on your brow."

"Well, well, don't blame me," said Valentine, "It is no crime to try to live at ease."

"No, if it were not such a milksop as you who talked of it," said Wagner. "Go and learn a trade, or an art, and labour till you are old and grey; then you may honourably and peacefully enjoy what you have gained."

"Indeed!" said Valentine, ironically. "Methinks it is too late to have bread when death is about to rob us of it. Why should I pine so long? Are there not thousands of others who are no older than I am, who can sit with their hands in their pockets and enjoy themselves. I ask no more."

"You have my permission to do so," said the Famulus, with frosty indifference. "Only don't expect help or assistance from us. Yet, stay, I will give you one piece of advice.—Go to the Rusingenberg, to Rûbezah, or into the Black Forest, where a much richer, and more powerful spirit is said to dwell, though he is not so well known. These are the patrons for you, and the like of you."

Valentine would have nothing to do with Rûbezah, because it was well known that this capricious being gave gold with one hand, and dealt blows with the other; or gratified his fickle disposition in some other way. Wagner told him he knew nothing of this Kobold, but that he was called Mammart, or Mammelack; that he lived in a ruined castle; that he appeared on his name being called, and that if he happened to be in good humour, he gave all that was required of him with tolerable politeness.

Valentine thanked him for the information, and prepared for a journey to the Black Forest. He had no money, but his father had a full strong box, and the son had an excellent skeleton key. He made use of it now more unscrupulously than ever,

because he was on the point of possessing great treasures, and could restore tenfold the few handfuls of ducats he had stolen.

With this honest resolution he took French leave. An easy journey on foot, of from four to five weeks, brought him to the borders of the Black Forest. He wandered about in all directions, until he came to a ruined castle, which had exactly the appearance of a ghost's dwelling. Confident that the rich man lived here, he went to the gate, looked in, and saw in the court-yard a forest of thistles, which shook their heads all together as though they would have warned him to go no farther. But this he did not think proper to do. He remained outside the door in expectation of being invited to enter. After waiting for some hours without seeing a living soul, he began to be impatient, and called in a loud voice, "Mammelack, Mammelack!"

Suddenly he felt box after box on the ear from an invisible hand; he started back, crying, "these are pretty gifts! does the gentleman receive visits in this manner? Why do I deserve to be treated so rudely? did not I call him by his right name? I'll tear my tongue from my throat if Wagner did not call him Mammelack."

He had scarcely said this when a fresh shower of blows descended, and a man's voice, accompanied by the barking of dogs, was heard from behind the wall, saying, "Go! seek the devil in hell, you obstinate fool, but not me; if I hear that nickname again I'll beat you to a mummy." Valentine recollected with horror that Wagner had mentioned two different names to him, but he could by no means remember the other, and he cursed his memory; which, like a sieve, allowed the useful corn to fall through, and retained only the worthless chaff. What was to be done now? it would take him too long to go back to Leipsig to find out the name he had forgotten; he preferred playing the sentinel before the castle as long as his provisions would last, and waiting patiently to see if the spirit would appear uncalled.

Four and twenty hours elapsed, and neither spirit,

man, nor beast appeared, with the exception of a raven that came out of the ruins, and walked backwards and forwards before the door. Valentine pursued him out of pure idleness. The raven allowed himself to be caught without much trouble, but then he defended himself with his beak and claws, and cried, as if for help, "Mammart, Mammart!" Suddenly a man's voice called out, "Let him go, you cowardly fool!" and a horseman came galloping out of the desolate castle. He was dressed like a hunter, and seated on a tabby-coloured horse with three legs. Valentine set the prisoner free and fled, but he had scarcely gone a hundred steps when he heard laughter behind him, and he began to be ashamed of his cowardice, and thought that by his departure he should altogether ruin his fortune. He therefore returned slowly, saluted the horseman, and said, "Pardon me, Sir, I did not know that the bird belonged to you, or I would not have touched him."

"You should have paid dearly for it, if you had known it," said the horseman; "but you don't look as though you would willingly lay hands on stranger's property, and yet you certainly did not come from Leipzig, where the wine is so excellent, into this desolate black forest without an object. What do you seek here?"

"Happiness," said Valentine, in a low voice.

"Do you seek the happiness of the wise or of fools?"

"The wise; by all means, the wise," said the student, encouraged by the hunter's mildness.

"You speak very laudably, my son," said the subtle spirit. "Go home, be an honest man, labour diligently, rule your passions, live within your means, and mark every day with some good deed; you will then be happy, contented, honoured, and beloved all your life."

Valentine made a grimace, and said, "Sir, your doctrine is without blemish; I have known it by heart long ago; and I was lately reminded of it afresh by Dr. Faust's celebrated Famulus; but to tell you the truth, it does not suit my taste to be labouring for ever, and after all to have nothing but vegetables to my soup. I wish to have a good property, that I may be raised above all care or drudgery, and to live comfortably and decently; for if one has plenty of money, it is but a child's play to be honest."

"You have very convenient ideas; carry them out if you can; I shall not interfere with them."

"You speak exactly," muttered Valentine, "as though you had agreed with the pedantic Wagner what to say.—Of what use is your quietness to me? I would have you take an active part in this affair; open a rich spring of gold for me; give me a maiden of heavenly beauty for my wife; and endow me so richly that I shall have nothing left to wish for."

Mammart laughed scornfully, to think that a man who had offended him in calling him by his nickname, should make such extravagant demands of him. He flatly refused to grant him his wishes, and turned his three-footed beast towards the interior of the castle.

But Valentine put himself in the way, and entreated so earnestly, that at last Mammart promised, though somewhat ambiguously, to give him something. He clapped his hands, and called across the court in a language which Valentine did not understand. A door opened, and a long box,

something like a pedlar's pack, reeled and staggered over the thorns and thistles in the court, without any visible impulse. It stood still before the horseman and awaited his orders.

"Take this chest, young man," said Mammart, "it contains all your heart desires."

Valentine looked narrowly at this simple thing, took it in both his hands, examined its weight, and then shook his head, saying,

"It is light enough; if it is not full of Heckthaler's I shall not long be able to keep open house. And where's the lovely maiden I asked you for? It is impossible that she could live in this box."

"Never look a gift horse in the mouth," said Mammart. "Take the chest or leave it. It's no matter to me."

Valentine fingered the chest irresolutely. He would willingly have opened it, to see what was inside, but the Wood Spirit, tired of his delay and hesitation, decided the bargain by saying, "Pack up the chest, or pack off with you. It contains more good than you think for. If you have no confidence in me and my words, go to the devil without it."

This speech had the desired effect.

"Anything is better than nothing," thought the student. So taking the chest on his back, he thanked Mammart coldly, and withdrew with hasty steps from the presence of the watchful spirit, to examine his treasure undisturbed.

He had not proceeded far, before he fancied he heard something moving in the chest. It became louder, and he distinguished a smothered coughing inside. He turned his head round to see what it was. The cover of the chest slowly rose, and a little old woman, with a sharp crooked nose, put her head out, and bent over his shoulder with a horrid smile. For one minute he stood as though he was petrified; the next, with horrid oaths and curses, he endeavoured to throw it from his back, but in vain; it seemed glued to him. And, after trying for some time to no purpose, the goblin threatened him with a ladle she had in her hand; and cried, "Cease, you good-for-nothing fellow, you will not be so fortunate as to get rid of me; we are bound together as though we were married, and we will live very merrily."

Valentine's hair stood on end. He strove again to get rid of his would-be wife; he leaped like a restive horse who would unseat his rider, and ran with his back against the trees, either to dash the meagre chest in pieces, or to loosen it from his shoulders. But he gained nothing but tremendous blows on the head from the goblin's sceptre, while the malicious forest spirit laughed so loudly that the wood rang again. Breathless, and exhausted, Valentine threw himself on the ground, and prayed for death.

"For shame!" said the old woman, "you are acting like a tormented husband, who has been married these twenty years. I am ready to separate, it only depends on one condition, which you must fulfil."

"Name it instantly," said Valentine: "I agree to it beforehand."

"That is just like you," said the old woman, "you always rush blindly into everything without consideration, but we will talk further of this affair when we are housed for the night; evening is coming on, and the night air may do me injury."

In spite of Valentine's chagrin he could not help laughing.

"Ah, you are getting better tempered," cried the goblin; "a merry little wife, as I am, is a jewel which should not be carelessly thrown away; besides, I have something here which few men despise."

This sounded to him like a bold jest; he looked round, fearing she was preparing some disgusting sight for him, but he heard the chink of wine glasses, as though she was pouring out wine, and the tippler could not keep his eyes off any longer.

The old woman shewed him a flask of wine, from which she filled him a glass. He at first sipped it timidly, then drank it off eagerly; the wine, in spite of his experience in such matters, was perfectly new to him, but he had never tasted better; he demanded another glass, but the covetous cup-bearer refused this, and advised him to practise more moderation; he felt himself strengthened by this sparing refreshment, and animated with new hope and courage.

He proposed to her to seek their quarters for the night, where he secretly intended to escape from his companion.

"I have a friend in this neighbourhood to whom we will go," said the old woman, and she led him to a miserable little hut scarcely two yards from the ground, lying concealed amongst thickly grown bushes. She knocked three times with the ladle at the door. "Who is there?" cried a coarse voice. "Your friend Trutta," said the lady in the chest. The little door was opened, and a dark dwarfish old woman appeared, holding in her hand a long black burning thief's thumb, which served for a light. "Ah, dear Trutta," mumbled she, "how came you to be here with this jolly young fellow? and what has made you so little?"

"Who but my master, the wood spirit," said Trutta, "sometimes he stretches me out like a giantess, and then he squeezes me like a dwarf, as it suits him."

During this dialogue the old woman led them into her room.

It was a small dark room, hung round with brooms and ladders. This was the stud of the witch, in readiness for the Walpurgis night, of which she was not a little proud, and between them were seen signs, circles, and pentagrams, while all round were seated in solemn state a number of black cats, who each offered a paw to the guests with hypocritical mildness.

The chest slid voluntarily from Valentine's shoulder, and placed itself on a bench; and Trutta, who looked like a chimney sweep in a chimney, demanded something to eat from her friend.

"My kitchen is cold, my cellar is warm," said her friend jestingly.

Trutta made a wry face, and declared that her hunger would compel her to seek better accommodation. "Stay, stay," said the old woman, there is a fine tender cat roasting on the spit, and it will soon be ready."

"Ah! my favourite dish," said Trutta; "but how could you bring your mind to sacrifice one of these dear creatures?"

"Ah, I am a strict mistress," said the old witch; "he was a cat of incomparable beauty, but a good-for-nothing vagabond, who would go wooing every where, and was not to be brought into order either by kindness or punishment."

"Do you hear, young Valentine," cried Trutta; "you will be roasted some of these days if you don't improve."

"What is the matter with him?" said the old witch.

"I'll tell you," said Trutta; "this morning this young blusterer came into our forest, called my lord and master boldly by his nickname, and then, as though he had deserved it, demanded a mountain of gold from him. Such insult Mammar never allows to pass unpunished; he presented the worrying fellow, who would take no denial, with this chest, in which there was no treasure but myself, and I am ordered to accompany and correct this idle beggar until he becomes an orderly man, and earns his bread by labour. Mark that, fellow! that is the only way of separating us two."

Valentine was obstinately silent, he was considering how he might easiest free himself.

The roasted criminal was dished up whole in its skin, the witches tore it asunder with their fingers, and offered the student a leg, which he refused with disgust. "The stupid fellow does not know what is good," said Trutta, "we must enjoy this excellent dish alone." They swallowed it like wolves, and in five minutes nothing was left but the bones.

(To be continued.)

POINTS OF VIEW.

THE beauty of a landscape depends, in a great degree, upon the point of view whence it is seen. The most striking objects, which, beheld in one direction, would be brought out in full development and pleasing contrast, may, when beheld in another, be stripped of their attractions. And thus, to adduce a more homely illustration, the streets of our metropolis present a different appearance according to the end at which you enter them: and persons who have found their way easily to an unknown quarter, sometimes lose their way on their return, so different did the same spot look when viewed in another direction. Not less is the effect which points of view, morally considered, produce upon our ideas of life, and our estimate of men and things.

Let us begin with the schoolboy. When, in some serious moment, he gets into a corner to muse on the dark future into which he is gradually advancing; or, when he engages in sentimental conversation with some companion on their expected career, how magnificent an appearance does life present! To be a man is with him necessarily to be very wise, very strong, and very happy: he is conscious even now of some talent, (did not the master, though somewhat chary of praise, highly extol his last Latin exercise! and was it not chiefly through him that the recent cricket-match was won by his school?)—but what he will be when a man, is a lofty consideration, to which he looks up with sentiments bordering on awe. Most persons of mature age, when they compare the fruit of experience with the flower of expectation, are filled with astonishment that the one should be the scanty produce of the other. Into what a golden city of pleasure, of independence, of successful enterprise, did they expect to come! amid what doleful ruins of broken hopes, of frustrated plans, are many of them now sitting. But happily, this is not always the case; for to some the fairy dreams of boyhood have been more than realized by the successful labours of subsequent years. Beautiful boyhood! great is the pity that some of thy choicest characteristics should be getting rarer and rarer in this precocious age. Thou standest, indeed, near the base of the hill of life; but pleasant are

the airs which play around thee, inspiring generosity of temper, elasticity of spirits, and disinterested friendship: and delightful is it when the memory of them comes to cool the feverish heats of business, rivalry, and ambition, which irritate the anxious forehead of the man.

When youth looks out upon life, the darkness becomes peopled with forms more distinct, but less pleasing: a species of terror begins to mingle with the anticipation: all is large, distorted, and grotesque. It is frequently led to spend its strength in hastening after objects, which on a nearer approach prove valueless, or not to exist; but still the glow which its own spirit sheds over all, the sunlight of hope, bids it go cheerily on its way.

The man of mature age is scarcely permitted to look about him at all. Forced along by the crowd, he plods on, buried in some favourite scheme, with eyes fixed absorbedly on what lies immediately before him. So many expectations have failed, so many things from which he augured the worst results have turned out for his advantage, that he now hardly ventures to look very far into the future, fully satisfied if he knows what his present duty is, and that he is performing it as best he may.

To old age, tempered by philosophy, and cheered by religion and the recollection of a useful life, things often appear as they really are. Happy age! when to him who has reached it, there are

"No fears to beat away, no strife to heal,
The past unguished for, and the future sure."

We might dwell on the aspect of life, when a death-bed is its point of view: but this is too grave a subject to be introduced here. Let it suffice to say, that the experience of mankind has found, that never do acts of injustice or cruelty appear so hideous, nor acts of beneficence, performed even to a man's own inconvenience, appear so lovely, as when viewed from this important and ultimate point.

The rich and the poor, contemplating each other's conditions from different points of view, often make great mistakes. The poor man looks at the stately mansion, or wanders over the spacious grounds, and perhaps thinks of the superior happiness of their owner, who is the while devoured by *ennui*, or disappointed ambition. So to the rich man, worn out by complicated perplexities, the poor man's quiet cottage sometimes appears a desirable retreat, while he forgets for a moment the struggle for daily bread, the craving for intellectual food, and the ill-suppressed discontent, so often found within its rose-mantled walls.

When, taking some newly-acquired happiness as our point of view, we cast a glance into the future, how we tremble, lest some dark figure should be seen lurking there, armed for the destruction of our joy! how eagerly do we close our eyes, lest we should detect the shadow of a cloud stealing over our sunshine! But, on the other hand, when affected by some absorbing sorrow, how blank is the prospect, and how indifferent the gaze we cast upon it! All that can be endured seems to be past; and we find ourselves left, as it were, on a barren rock, looking out upon a world over which roll the waters of an universal deluge. But, when the first anguish has subsided, and the agitated pulses of the heart begin once more to beat evenly, it is found that, by suffering, a keener insight into surrounding objects, and a wider range of vision over both worlds, have been obtained. "It may be," says a modern divine, "that suffering plants the mind of man at a point of sight in the spiritual world, from which things altogether hidden from us who stand by and see its affliction, and until then even from himself, become visible."

It is amusing to consider the inferior, and even despicable, aspect that the world presents to a man looking down upon it from the elevation of what is appropriately

termed a "towering passion." He is the insulted, the outraged, and the betrayed: he would not stoop to revenge himself; no, vengeance would be too poor a retribution; he will stand alone in his grief; he asks no compassion, he will demand no compensation. He fancies himself an eagle soaring above mankind: alas! he might more fitly compare himself to a balloon inflated by the gas of pride, which will soon collapse, and let him down again to the level of his fellows.

When, having read in a newspaper some tale of barbarity, we take this as a standing-point whence to inspect the history of the world, what do we see but a long series of massacres, wars, oppressions and outrages? a multitude of frightful facts rush upon the memory; and "verily," we exclaim, "man is a wolf to man." But, contrariwise, when we have met with some anecdote of a philanthropist who has exposed his life for the good of others, or devoted his earnings to their relief, how different a spectacle does this bring around us! Now we see the prophet who has taught, the hero who has bled, the martyr who has endured, the artisan who has toiled for the world: and we stand astonished at the height of virtue to which a mortal is sometimes permitted to climb.

When a man views another, taking himself as the point of view, he sometimes falls into strange absurdities. "One never sees a smile on that man's face," says some gay fellow of his graver friend, "it is oppressive to be in his company. One would go a mile to keep out of his way." Our gay friend, however, gets into trouble, as such merry persons occasionally do; and the first person to whom he applies for advice and assistance is this very individual whose gravity had hitherto been so terrifically repulsive. The result of his application leads him to acknowledge that his friend is an exceedingly good fellow after all; the point of view from which he beholds him has been quite changed.

How different is the point of view from which we gaze on ourselves from that whence others behold us! Let us look in fancy at that city exquisite who has just stepped out of his counting-house towards the close of the day. His coat, of the last fashion, is carefully brushed, and so is his hat: his cravat is unimpeachable: his chains tasteful: and gracefully ascends the smoke of his cigar. To whom does he appear that model of perfection he is in his own eyes? To no one: not even to the good-natured servant-of-all-work over-the-way, who finds something to admire in every member of the opposite sex, from the nimble boy who cleans her master's boots, up to the octogenarian next-door, whose serene countenance occasionally gladdens her as he passes her kitchen-window on sunshiny days. Horace represents the miser as saying:—

"The people hiss me, but I praise myself at home."

While taking his own fireside as his point of view, the covetous man's opinion of his peculiar worth magnifies to an indefinite extent: his individual importance dilates into immensity, and nothing besides remains visible. But the benevolent man, taking his standing on the broad platform of humanity, discovers himself to be an unit of a vast multitude of which the members nearest to him have claims on his regard almost equal to that due to himself: and he makes of his home, not a narrow circle out of which his affections never care to stir, but the centre of a circumference, bounded only by his capacity of doing good.

A shipwreck we should conceive must be a horrible sight when viewed from amid the splitting timbers, the creaking yards, the torn sails, and tottering masts; when the shrieks of the timid, the silent paleness of the brave, the roar of the winds, the vehement uprising of the waves, combine to assault the heart with multiplied shocks of terror. Yet, viewed from the shore, this same spectacle is declared by Lucretius to be—pleasant!

"Tis pleasant, when the seas are rough, to stand
And view another's danger, safe at land."—*Cresat.*

How different does man appear when seen mixed with others, and when beheld alone! When he forms one of a multitude like that immense army over which Xerxes wept, or like that courteous throng which, at the coronation of our present most gracious Sovereign, filled almost to suffocation the vast area of Charing Cross, the individual becomes reduced to the dimensions of an insect, though a deep impression of sublimity is caused by the congregated whole. But, on the other hand, when we consider him standing alone in some spot remote from his kind, how grand is the aspect he assumes! He is now the lord of all around: "creation's heir, the world, the world is his:" he is a hierophant interpreting nature's mute symbols into intelligible words. This thought has sometimes occurred to us when, while wandering absorbed in meditation through some retreat into which human footsteps but seldom intrude, another man has suddenly been seen approaching us. More importance seemed to attach to that one human being than to the whole crowd who had been wont to jostle us in Cheapside. Who was he? Why was he there? Was his "intent wicked or charitable?" Was he about to speak to us? We have been thrown for a moment or two into a state of curious perplexity, and have breathed more freely when he had passed.

A judicious and sound-minded writer has shown the great advantages of points of view in carrying on controversies to an interminable length. "There are very few things indeed," says Mr. Alexander Knox, in one of his letters to Bishop Jebb, "which will not be seen differently, from different points of view. If any one therefore resolves to oppose, all he has to do is to discover the point of view from which a different appearance will present itself; and then obstinately set the one appearance against the other, with steady disregard of all explanatory considerations. In this way, controversies may be carried on for ever: as in this way, they have already been multiplied, *ad infinitum*."

In conclusion; as, when we wish to gain the most extensive prospect, we select the most commanding point of view, so, if we would bring before our minds the full beauty of the goodly framework of created things, we must endeavour to reach in faith or in fancy, that eminence whence we may

"Look down with wonder on the sudden view
Of all this world at once;"

and so form some idea of the symmetrical design which pervades the vast realm of Providence. For we are persuaded that, could we gain some central point around which the manifold revolutions of the moral and physical universe, "cycle and epicycle, orb in orb," might be seen running their harmonious rounds, we should learn to blush at the short-sighted judgments which our impatience, catching at seeming contrarieties, is so apt to pass on the arrangements of this sublunary sphere.

M. N.

DUNBAR CASTLE.

It is matter of observation to every Border tourist, that by far the most magnificent remains of fortresses are presented by the English frontier. While the Castles of Alnwick, Raby, Wark and Naworth, attest the superior wealth and power of the land whose grim wardens they were, little is to be seen on the Scottish side worthy of having been the home whence issued the Armstrongs and Elliots, and other redoubted chiefs of "the Debateable Land," except the grass-grown ruins of a remote age, and a few inconsiderable structures of a later date on these. The reason of this is to be found in the fact, that the Scotch, unskilful in the art of defence, found it their best policy to demolish the fortresses they had retaken, and trust to their

native hardihood, and knowledge of the passes, for success in their forays.

While this was pretty generally the case on the Border, it was not so further in the interior. There, amid the gloomy hills of Liddesdale, rose, stern and grim, the mighty Castle of the Hermitage, while those of Tantallon and Dunbar frowned from their lofty foundations over the German Ocean. The ruins of these, and especially of Dunbar, although presenting but little to the eye, are yet "grey with glorious ages," and are so interwoven with Scottish history, that a brief meditation among them may not be unprofitable.

On the most salient point of a stern barrier of rocks which girds the plains of East Lothian and Berwickshire, and withstands the fury of the German Ocean, stands the Castle of Dunbar. A type of the iron age in which it was built, its massive walls seem as if they were a continuation of the rugged rocks from which they spring. In those days men sought not a dwelling-place amid the fairer scenes of nature, and here they have attempted to isolate themselves from the land in towers which might bid defiance alike to the war of man and the elements. Walls of enormous thickness running from rock to rock; turrets that overlooked leagues of land and sea, by their ruins attest as well their own strength, as the fierceness of the elemental warfare that has raged around them. The sea has worn long and dreary caverns beneath the castle, and each returning tide roars and chafes underneath the dismantled fortress, awakening other music than the revelry of the forgotten barons who once rejoiced in the security of their sea-beaten home.

But,

"There was a day when they were young and proud;
Banners on high, and battles passed below;
But they who fought are in a bloody shroud,
And those which waved are shreds of dust ere now,
And the bleak battlements shall bear no future blow."

The date of its erection is not known, but the founder of the house of Dunbar and March was Patrick, Earl of Northumberland, who in 1072, fled thither from the wrath of William the Conqueror. Although the barony had been conferred on him by the Scottish king, the Earls of Dunbar adhered to the English during the memorable struggles of Wallace and Bruce for the independence of their country. Hence their name, Cospatriek, (abridged from "Comes Patricius," the name of the first earl,) has been branded with infamy in the legends of that illustrious period. It was left for a female member of the house to redeem its character for patriotism, by her memorable defence of the castle.

About the year 1334, the Countess of Dunbar, a daughter of Randolph, and grand-niece of the Bruce, but better known by the name of "Black Agnes," had remained in the castle, when her lord, who had now given in his allegiance to David III. had taken the field against the English. Meantime the castle was besieged, but in vain did Montague, Earl of Salisbury, assail the devoted walls with all the machines that English ingenuity had then devised. The high-spirited lady, walking with her maidens along the walls, gaily wiped with her handkerchief the dust produced by his engines, and, strong in her impregnable position, taunted the English earl on the failure of each of his assaults:—

"Beware, Montague,
Beware of thy sow,"

are the well known rude rhymes she uttered as a huge rock was hurled on the advancing machine, under cover of which Montague sought to undermine the walls. While blunders and incapacity marked the proceedings of the Scotch army, this gallant lady, with a courage worthy of her kindred, held out for six weeks, when, just as the garrison was reduced to the extremity of famine, Sir Alexander Ramsay performed the exploit of conveying supplies to them by sea on a dark night,

and by a vigorous sally, next morning, routed the besiegers.

The fortunes of the castle after this varied with those of its possessors. With a fickleness peculiar to Border nobles of those days, the tenth earl, in consequence of a quarrel with the Duke of Albany, brother of Robert III., transferred his allegiance to Henry IV. of England, in whose service he distinguished himself at the battle of Shrewsbury. His estates were forfeited, and the castle passed to the favourite, Albany. This prince has left no memorial of his power behind him, save the royal arms of Stuart, which, although bleached and defaced by the sea breezes, may still be deciphered on a lofty gateway beside those of Dunbar and the Isle of Man:—"Sic transit gloria mundi."

Little historical interest attaches to the castle till the year 1567, when it again became identified with the fortunes of an illustrious female.

To the spot which "Black Agnes" had made famous by her heroism, fled the ill-fated Mary Stuart after the murder of Rizzio, and again, in one of the guiltiest passages of her chequered life, she sought it in company with her profligate husband Bothwell. She too passed away from the gloom of this wave-beaten fortress to scenes darker and sterner still; and, before long, the cannon of the Regent Murray demolished what the violence of former ages and the fury of the storm had left of Dunbar Castle.

The prospect from the castle is very grand; on the one side the eye loses itself in the blue expanse of the German Ocean, while on the other, looking up the Firth, stands the Bass rock;

— "an island salt and bare,
The haunt of seals, and ores, and sea-news' clang;"

and beyond it the green fields and pleasant hills of Fife.

Behind stands the old town, deserted and dull, except when the summer months bring round the herring fishery; and then in its own rude way it is gay enough, and a pleasant sight it is of a calm summer evening to see the two or three hundred fishing-boats stand out for the deep water—a flotilla of industry amid the perils of the deep. All through the twilight of these summer nights do they watch in silence by their nets, till the first rays of the sun shine upon the heaving and glistening mass of scaly beings which crowns their labours. All honour be to those hardy sons of the sea, whose perilous labours provide so largely for the poor man's winter fare on those northern shores!

If the rocky barrier of this coast resists a stormy sea, it protects a fertile plain. A smiling landscape of rich corn fields, and substantial farm houses, stretches from the sea to the hills. But this spot, now so peaceful, is rich in historic recollections, for it was the scene of one of Cromwell's greatest triumphs.

We trust that a brief review of this memorable battle, aided by Mr. Carlyle's vivid and impassioned description, may not be unacceptable to our readers. Oliver Cromwell, now Captain of the 'Commonwealth, having overrun England, finds that the Scottish Presbyterians who lent such powerful aid to his cause in its earliest stages, have now made a stand, and while they fight for the "Covenant," fight also for a Stuart king. Accordingly, in June, 1650, Scotland is invaded. Cromwell advancing by Berwick and Dunbar to Edinburgh, in vain demands admittance there; the neighbourhood is deserted, and no provision can be got for his army. He is then forced to retire back upon Dunbar, whither supplies can be brought him by sea. While he is encamped in and about the town, Lesley, at the head of the Scottish army, having closely followed his rear, now hangs on the Doon Hill, the last of the Lammermoor range, a position of uncommon strength, while it confines Cromwell to the narrow peninsula his soldiers occupy, and cuts off all communication with England except by sea. His men are wasting away with sickness,

provisions begin to fail, and storms forbid all hope of relief by sea. Never hath the Protector been in such evil plight before. Lesley has but to hang a fortnight more on these heathy hills, and the overthrower of kings must be himself overthrown. "He was a strong man, (we quote from Carlyle's *Cromwell*), 'so intimates John Maidstone, who knew him,' in the dark perils of war, in the high places of the field, hope shone in him like a pillar of fire, when it had gone out in all the others."

A mile and a half to the east of Dunbar, a rivulet or burn flows from the Doon Hill to the sea. Deep and rapid as those hill streams are, Cromwell's troops are drawn up on the left side of this. There are but two fords across it; one of them Cromwell has seized, and is about to seize the other. "There at this pass on and about the present London road, as you discover after long, dreary, dim examining, took place the brunt or essential agony of the battle of Dunbar, long ago Yes, my travelling friends, vehiculating in gigs, or otherwise, over that piece of London road, you may say to yourselves, 'Here without monument is the grave of a valiant thing which was done under the sun; the footprint of a hero, not yet quite undistinguishable, is here.'"

Leslie, who from the Doon Hill watches every movement of the enemy, is led to the fatal error of descending to the plain. To use Cromwell's expression, 'he shogs' down, and takes up ground on the right bank of the stream. Cromwell detects at once his error, and determines to take advantage of it. He will cross the stream, and be the first to give him battle, and this the next day before dawn. We borrow from the page of his enthusiastic biographer the description of this dexterous battle:—

"The night is wild and wet; 2d of September means 12th by our Calendar; the harvest moon wades deep among clouds of sleet and hail. Whoever has a heart for prayer, let him pray now, for the wrestle of death is at hand. Pray, — and withal keep his powder dry! and be ready for extremities, and quit himself like a man! Thus they pass the night, making that Dunbar peninsula, and Brock rivulet, long memorable to me. We English have some tents; the Scots have none. The hoarse sea moans bodiful, swinging low and heavy against these whinstone bays; the sea and the tempests are abroad, all else asleep but we—and there is one that rides upon the wings of the wind.

* * * * *

And now is the hour when the attack should be, and no Lambert is yet here; he is ordering the line far to the right yet; and Oliver occasionally, in Hodgson's hearing, is impatient for him. The Scots too, in this wing are awake, thinking to surprise us; there is their trumpet sounding, we heard it once; and Lambert who was to lead the attack is not here. The Lord General is impatient;—behold, Lambert at last! The trumpets peal, shattering with fierce clangour night's silence; the cannons awaken along the line; 'The Lord of Hosts! The Lord of Hosts!' 'On, my brave ones; on!' A desperate charge of artillery and cavalry bursts on the Scottish main line; soldiers stiffened with exposure to the autumn night make a brave, but hopeless resistance, and the battle soon becomes a rout.

"And over St. Abb's head, and the German Ocean, just then bursts the first gleam of the level sun upon us, 'and I heard Nol say, (in the words of the Psalmist), 'Let God arise, and let his enemies be scattered!'" Three thousand dead, and ten thousand prisoners are the fruit of this military blunder.

With this battle ceases the historic interest of Dunbar. Over that plain, once plashy with autumn rains, and the blood of a Scottish army, a long succession

(1) Carlyle's *Letters and Speeches of Oliver Cromwell*, Vol. II. p. 16.

of peaceful harvests has waved, and a railway now bears the unconscious traveller past the Doon Hill and Brocksbury.

T.

THE DUKE OF ALVA'S BREAKFAST AT THE CASTLE OF RUDOLSTADT. (A. D. 1547.)

From Schiller.

On turning over an old chronicle of the sixteenth century (*Res in Ecclesiâ et Politicâ gesta, ab anno 1500 ad annum 1600*) I found the following anecdote, which deserves, for more than one reason, to be rescued from obscurity. It is confirmed in a writing called, "*Mausolea manibus Metzelii posita a Fr. Melch. Dedekindo. 1738,*" and it may also be found in Spauberg's "*Adelspiegel.*"

A German lady, of a family which had given an emperor to Germany, once almost intimidated the dreadful Duke of Alva, by her resolute behaviour. When the Emperor Charles V. passed through Thuringia, on his way to Franconia and Swabia, after the battle of Muhlberg, the widowed countess, Katherine of Schwarzburg, procured from him a "safeguard" for the protection of her vassals from any molestation or injury which they might otherwise expect at the hands of the Spanish army, in return for which she engaged to furnish the Spaniards with bread, beer, and other provisions, at a moderate rate, to be conveyed for them from Rudolstadt to the bridge where they were to cross the Saal. But she had the precaution to destroy immediately this bridge, which was close to Rudolstadt, and to throw another over the river at a greater distance, in order that her rapacious guests might not be tempted to excesses by the too great vicinity of the town. She also permitted the inhabitants of all the villages round, through which the troops were to pass, to transport the best of their possessions to the Castle of Rudolstadt, for security. Meanwhile, the Spanish general, accompanied by Duke Henry of Brunswick and his sons, approached the town, and sent on to invite himself to breakfast at the castle. So modest a request, from the commander of a powerful army, could not well be refused. "What the house could afford should be freely given; and it was hoped His Excellency would be contented with what he might find," was the answer returned by the countess, who, at the same time, remembering the safeguard, did not fail to beg the general to observe it conscientiously. A friendly reception, and a well-furnished table, awaited the duke at the castle. He could not but acknowledge the hospitality and excellent housekeeping of the Thuringian ladies. But hardly were the guests seated at table, when an express messenger called the countess from the hall. She was informed that the Spanish soldiery had behaved with violence at some of the villages on the road, and driven off the peasants' cattle. Katherine was the mother of her people; any offence against the poorest of her vassals she regarded as committed against herself. Irritated to the highest degree by this breach of faith, but preserving her presence of mind, she armed her whole household with speed, but without noise, and commanded the castle gates to be securely fastened. Then returning to the hall, where the princes were still seated, she complained to them in the most moving manner, of the flagrant disregard of the emperor's promise, of which she had

just been informed. She was answered laughingly, that such little misfortunes were the chances of war, and could not be guarded against on a march. "We will see that," cried she, angrily. "My poor peasants must, and shall, have their property again; or by Heaven," raising her voice in a threatening tone, "the blood of princes for the blood of cattle!" So saying, she quitted the banquetting hall, which was instantly filled with armed retainers, who, sword in hand, but with the utmost respect, proceeded to station themselves behind the princes' chairs, and wait on them at their meals. The visitors looked at each other in silence and embarrassment; the duke himself changed colour at the entrance of this armed force. Cut off from his army, surrounded by a superior number of determined men, what could Alva do but take patience, and endeavour to appease the injured lady on any terms? Henry of Brunswick first recovered his self-possession. He with great tact and prudence turned the whole affair into a joke, and himself laughed long and loud. He praised the countess for the motherly care she took of her tenantry, and the wonderful courage she had evinced, and undertook to persuade the Duke of Alva to make all reparation for the outrage committed by the troops. And by him the latter was really induced to despatch an order to his men for the immediate restoration of the cattle to their lawful owners. As soon as the countess had made sure of this, she cordially thanked her guests, and they took a most polite leave of her.

It was doubtless this occurrence which procured for Katherine, Countess of Schwarzburg, the surname of "The Heroine." Still renowned is the determined activity with which she furthered the progress of the reformation, which her husband, Count Henry XXXVII., had before introduced into his dominions; the perseverance with which she endeavoured to abolish monkery, and to improve school-education; and her untiring humanity which protected and supported numbers of Protestant ministers, who were persecuted elsewhere for their religion's sake. She died universally revered and lamented, in the fifty-eighth year of her age, and twenty-ninth of her reign, and lies interred in the church of Rudolstadt.

Poetry.

In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.

THE INJURED FATHER.

THE Order of the Friars of the Madonna was instituted in 1208, to resist heretics and all violators of justice. They were constrained to employ the sword wherever the Roman Church commanded. They bore a white shield with a red cross on it, and they were not permitted to wear spurs or bridles of gold. In after ages they went by the name of the "Joyous," because, as a religious body, they were exempted from all taxes and secular burdens, and, becoming rich, lived sumptuously with their wives and children.

Farinata, son of Messer Marzucco of Pisa, (a friar of this

order,) was slain by Messer Beccio da Caprona. His father received the intelligence without tears, pardoned the homicide, collected his brother friars, and at the burial of his son preached a sermon recommending resignation and forgiveness to the relatives, and peace to the populace.

'Twas in dark days of feud and strife,
With deeds of ruthless bloodshed rife,
Such as oft brought vengeance dire,
Handed down to son from sire;—
Yet, even in that age defiled,
Christ wanted not some servants mild,
Who, by His peaceful law, could tame
The raging of their pride, however fierce its flame.

In Pisa's streets, throughout the day,
Loud rose the shout of wild affray.
An old man came to seek his son;—
A friar's garment had he on,
A cross of blood on snow-white shield,—
For he had sworn the sword to wield
Wherever Rome to arms should call,
And bid her trusty sons upon her foremen fall.

He sought, and all too soon he found!
His son lay weltering on the ground;
The life-blood oozing from his heart
Had forced the spirit to depart.
Awhile the lonely father gazed;
Then unto Heaven his eyes he raised;
But not a tear bedewed his cheek,
Nor one rebellious murmur was he heard to speak.

The corpse is placed upon a bier,
They bear it to a Convent near,
That in the Church it may abide;—
But there they find the homicide!
The Altar's shelter had he sought
E'en where the murdered man they brought.
Before the slayer of his son
The injured father stood, nor did his presence shun.

Upon his cheek a burning spot
A moment glowed, and then was not;—
An ashy paleness took its stead;
And of his eye the fire was dead,
Though first it blazed with hasty flame;
Then o'er his limbs a trembling came.
He clasped his hands, and looked to Heaven,
And said: "Lord, I forgive, and pray to be forgiven!"

He turned, and left the murderer,
Who gazed on him with awe and fear.
The kinsmen of the slain he sought,
The brothers of his band he brought,
The youth they were too late to save,
To place with honour in the grave.
Now surely he will silence break,
And bid them vengeance due on foul aggression take.

So deemed the crowd who round him stood;
The kinsmen muttered: "Blood for blood!"
The outraged father thus began,
And still his words on mercy ran:
"O God! who gave to us Thy Son,
By whom our hope of heaven is won,
Assist me with Thy Spirit meek,
While to assuage the wrath of these fierce men I seek!"

He paused; he cast one piteous glance
Upon the corpse, then cried: "Advance!
Gaze on this youth, so fair and young,
And every wound shall be a tongue
To tell how murderous blow expelled
His soul the clay in which 'twas held.
Come hither, ye who know him,—say,
How bright and beautiful this face was yesterday.

"Then pause,—restrain your kindled rage,
For other thoughts my mind engage.
Another mangled form I see
Bound fast to an accursed tree!
He also is an only Son.—
Smitten, scourged, and spat upon!
Pierced are His hands, and pierced His feet;
His ears revivings loud, and scoffs, and mockings greet.

"See how his bleeding brows around,
A crown of platted thorns is bound.
His Father is a mighty King,—
Can He not destruction bring
On the foes that kill His child,
And thus have marred His visage mild—
Laughing to scorn His matchless woe,
Saying: 'Now save thyself, and we will humage show!'"

"Oh! if His Father thus sustain
The spectacle of Jesus' pain,—
If the spotless Jesus thus
Foureth forth his blood for us,—
Shall we sinners dare repine
At His orderings divine?
No! this bleeding clay I bring
Unto the Altar's foot, an offering to my King!

"Oh! Thou, who didst for sinners die,
Cast upon me now Thine eye;
Give my pleadings power to move
These stern men to deeds of love!
The wound that Peter in his zeal
Gave in haste, Thy hand did heal.
Fain would I to my bitterest foe,
E'en Lord, for Thy dear sake, as sweet compassion show."

To Heaven he lifts his streaming eyes.
No voice in all the crowd replies;
One by one, they wend their way;
By the corpse he still doth stay;
Shades of night are gathering round,
He kneels beside it on the ground.
His prayer is answered—he hath peace!
And all rude threats of strife and hate around him cease.

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne.*

WHATEVER withdraws us from the power of our senses; whatever makes the past, the distant, or the future, predominate over the present, advances us in the dignity of thinking beings. Far from me, and far from my friends, be such frigid philosophy as may conduct us indifferent and unmoved over any ground which has been dignified by wisdom, bravery, or virtue. That man is little to be envied whose patriotism would not gain force upon the plain of Marathon, or whose piety would not grow warmer among the ruins of Iona.—*Dr. Johnson.*

Most men are deceived in being too reasonable; concluding that reason will prevail with those men to submit to what is right and just, who have no other consideration of right and justice but as it advances their interest, or complies with their humour and passion. And so easy it hath always been to do harm, and to mislead men; and so hard to do good, and reduce them to reason!—*Clarendon.*

VOL. III.

BEER BREWED FROM SUGAR.

THE scarcity in, and consequent high prices of, grain, have of late led to the suggested substitution of sugar and molasses in breweries and distilleries. There are various fiscal considerations connected with this measure, to which we may hereafter advert; but first we shall glance at the employment of sugar in domestic brewing, that is, brewing upon a small scale.

A popular writer on domestic economy, (Mr. Donovan,) observes:—"For making excellent ale or table beer it is not absolutely necessary to use malt. To conceive this subject rightly, we must consider that it is the sugar of the malt which undergoes fermentation, and that any other sugar will ferment just as well, *although no other sugar is so cheap.*" To this statement we request especial attention.

"Economy and long habit," continues the writer just quoted, "have established malt sugar as a brewing material, but cane sugar will afford an excellent drink. To persons residing in the country, and far from breweries, as well as to those who do not choose the great trouble of managing malt, this is a valuable fact. Another advantage of cane sugar is, that the apparatus necessary for converting it into beer is much more simple: all that is required is a cask which has no bung-hole, or has it well stopped up. This is to be placed standing upon either of its ends: a cock is to be fixed in one of the staves, about an inch above the bottom chimb, so that, in drawing off the liquor, the sediment cannot also run. In the centre of the top of the cask; that is, in the centre of its other end, a hole is to be bored, of such size as will admit a large bottle-cork.

"Let us suppose that the cask holds ten gallons, and that the drink is to be tolerably strong ale. The proper quantity of hops required for ten gallons of ale, in this process, will be about a pound and a half. On this quantity, contained in any convenient vessel, pour eleven gallons of boiling water; or, what is much better, boil the hops in the water for about five minutes, and so more; then strain off the hops; in the strained liquor dissolve fourteen pounds of sugar, and mix in a pint of yeast of the best quality.

"Put the whole into a cask; it will soon begin to ferment; it will throw up its yeast through the cork-hole at top, and then, being retained within the external rim of the chimb, it will, for the most part, fall back into liquor, and run back into the cask. It will require, at the ordinary temperature of summer, as much as three weeks or a month to complete the fermentation. For the last fortnight, the cork may be generally kept in the hole; but it should, once every two days, be removed, to give vent to the fixed air; and then it should be replaced. When the fermentation appears at an end, the taste of the sugar will almost have disappeared. The cork may then be permanently driven in, and in four days the ale will be fit for draught or bottling.

"As to the quality of the sugar, it is a matter of little consequence. White sugar will afford an ale scarcely coloured: brown sugar will impart proportionate colour, and not quite so pure a flavour. Should colour be an object, it may be communicated by the raspings of an over-baked loaf, or by scorched treacle; but this is a matter of little moment. The drink will spontaneously fine itself.

"To persons who have acquired an inveterate predilection for the abominable and varied flavour which the skill of the brewer enables him to communicate, this pure and simple drink may be less pleasing; but it is singular how soon the consumer acquires a high relish for it, and prefers it to every other. There is a purity of taste belonging to it quite different from the indescribable jumble of tastes so perceptible in common

ales; while it has a slight sharpness combined with tenacity, which is much more agreeable than the glutinous or mucilaginous softness of even the best ales. But it has one advantage which places it above all competition, and that is its lightness on the stomach; this, when compared with the sickly heaviness of malt ale, is remarkable. The whiter the sugar the lighter will be the ale; and age greatly conduces to the same end, provided that the drink be sound, which is best insured by bottling."

Thus far Mr. Donovan's method: we have tasted beer made by it, though not with the requisite attention to the several stages of the process. It by no means came up to Mr. Donovan's standard; but we have known beer thus made to prove excellent.

There is, likewise, a mode of economising malt. Thus, to half a bushel add four pounds of treacle, and three quarters of a pound of hops; this will make twenty-five gallons of beer, the cost of which will be but twopence per gallon, where the materials are purchased to the best advantage. This beer will be fit to drink in a fortnight, but will not keep in warm weather.

Table-beer may be made without malt, by boiling four pounds of coarse sugar, and three ounces of hops, in ten gallons of water, in a covered copper, for three quarters of an hour: ferment the strained liquor in the usual manner, keep it for a week or ten days, and it will be fit for use.

Or, a pleasant and wholesome beer may be made as follows:—to a quarter of a peck of sweet wheat bran add three handfuls of hops, and ten gallons of water, boil the whole together in a copper until the bran and hops sink to the bottom: then strain it through a hair sieve into a cooler, and when lukewarm add two quarts of molasses, this will be sufficient for a nine gallon cask. Before you pour in the liquor, which must be done as soon as the molasses is dissolved, put two table spoonfuls of good yeast into the barrel; bung it up when the fermentation has subsided, and in four days it will be fit for use; it will, however, be improved by bottling; in which case it will be ready to drink in six or seven days.

Molasses has been mentioned as a substitute for malt, as well as sugar; and we shall now proceed to consider the economy of these substitutes, as determined upon a large scale.

In "the Art of Brewing," an admirable treatise by the late Mr. David Booth, who was, at one period, a common brewer, it is stated that "of all the substitutes for malt, raw grain is the principal; if, indeed, that can be called a substitute which is merely malted in the mash-tun in place of the floor." The process by which the conversion of barley, or other grain, into malt, is thus rapidly performed, is detailed in Mr. Booth's work; while we warn the public brewer of the legal danger of its adoption, we strenuously recommend its use in private families. Were the practice to become general, a deduction of the duties on beer would indubitably follow.

"Pure sugar and water, (it has been said,) will not ferment; but raw sugar, or molasses, will make very good beer, either alone, or mixed with malt-wort. There is, however, no saving from the use of these materials, unless when malt becomes much dearer than in ordinary years; in which case they are occasionally permitted to be used under the authority of the Lords of the Treasury. A weak beer from molasses is frequently made in private families, and drunk in a half-fermented state; but it is too lucid for the taste of those who are accustomed to the small beer of malt. Molasses, mixed with a weak malt-wort, would, when fermented, be much more palatable." A receipt of this class is given above.

Such a "permission" as Mr. Booth refers to, has of late been mooted by Government; and, with the view of determining its policy in the present scarcity of grain, the Board of Excise have reported to the Lords

of the Treasury on the comparative value of grain and sugar in brewing and distilling:—

"Before the Select Committee of 1831, 'On the Use of Molasses,' various estimates were made of the weight of sugar equivalent to a quarter of malt in brewing. Of course, they varied much, according to the allowance made for the quality of the grain and the skill of the brewer—the lowest being 173lb. of sugar to the quarter of malt, and the highest 226lb. The average is 199½lb. It is a general opinion, that 'the saccharine produce of barley has been increased of late years by the cultivation of a superior description of grain, and by improved modes of working in breweries;' and the mean (200lb. to the quarter) adopted in the bill brought in lately by the Chancellor of the Exchequer seems, therefore, to be a safe one for the average of years. The most common estimate is that 180 pounds of sugar is equal to a quarter of malt; but the experiments recently made fix it very near the average struck in 1831; and this seems by far the most likely to be correct. By the 52d George III., c. 3, it is assumed, as to distilleries, that a hundred-weight of sugar will yield, upon an average, about 11½ gallons of proof spirit. The evidence before the Committee of 1831 conduces us to the same conclusion. And the experiments now made quite confirm it. The value of molasses in brewing has now been tried by only two experiments; and the general conclusion is, that about 300lb. of molasses will yield the same quantity of beer of a given strength as a quarter of malt. The question of comparative value must remain in some degree undecided until it shall be ascertained, in practice, whether the beer brewed from the former necessarily retains any peculiar flavour. In distilling, the common opinion is, that a hundred-weight of good molasses will yield eight gallons of proof spirit. The average of ten experiments by the Excise gives about seven and one-third gallons. But, if we allow for the different results invariably obtained in fermenting large and small quantities of wash, it must be allowed that here the common estimate is more likely to be found correct in practice. The Commissioners, however, seem inclined to adopt the *minimum* of 7½ gallons; and, assuming that the quarter of malt yields 18 gallons, would fix its equivalent in molasses at 278lbs."

The following deductions are from an article in *The Globe* newspaper of Feb. 2:—

"To apply these calculations to the present state of the markets for grain and sugar—First, as to the distiller. The London average price of barley, by Friday's *Gazette*, (Jan. 29,) was 58s. 3d. per quarter. Its price has since receded from 2s. to 5s. per quarter in all the principal markets of the kingdom; and it cannot, for practical purposes, now be taken at more than 56s., if so much. Admitting, then, that a quarter of barley will yield 20 gallons of proof spirit (a full estimate), one gallon so obtained will cost about 2s. 9½d. The average price of West India sugar, duty paid, was, last week, about 52s. 6d. per hundred-weight. If one hundred-weight yield 11½ gallons of spirit, a gallon of such spirit will cost about 4s. 7d. And the average price of molasses, at the same time, being about 28s. 6d. per hundred-weight, it follows that if that quantity yields eight gallons of spirit, the cost per gallon will be about 3s. 6d. But the use of molasses is not yet permitted. It follows that the distiller has no inducement, at present prices, to substitute sugar for grain.

"As to the brewer, the Report before us states the relative values of sugar and malt for brewing, in reference to every price of the latter, from 50s. to 90s. per quarter. Taking the present price of malt at 80s. per quarter, if its equivalent in sugar be 200lb., the value of a hundred-weight of sugar to the brewer will be 44s. 9d.; and if the equivalent be 180lb., as is more commonly supposed, the relative value of the sugar will be 40s. 9d. The average price of West India sugar is now 52s. 6d. Some sugars are quoted much lower, but no large quantity could be bought for a new purpose at a less price than that stated. At present, therefore, there is little, if any, inducement, even for the brewer, to substitute sugar for malt. The free use of molasses in breweries, under the present duties, would, undoubtedly, yield a profit, assuming that its flavour did not reduce the value of the beer. But this arises from the duty on molasses being lower in proportion to its brewing value than the duty upon either sugar or malt. The abandonment of malt for molasses would therefore cause a loss to the revenue."

To this we may add, that in 1807, when the price of malt was 32s. per quarter, it was shown that the price of sugar *should* be from 32s. to 33s. per cwt. to induce distillers to use that article in their trade in preference to malt.

What may be the result of these financial deductions, in the reduction of the duty on sugar so employed, remains to be seen. Meanwhile, it must be conceded, that malt is by no means necessary to the production of wholesome agreeable beer.

Beer from mangold wurzel may be made by cleansing half a hundred weight of the roots, and boiling them an hour and a half in fourteen gallons of water; then, slice the roots, pulp them through a sieve, and add the juice to the water they were boiled in, which boil for an hour and a half with four ounces of hops; strain it, and work it for a day with half a pint of yeast; then, skim off the yeast, and put the beer into a barrel, keeping back the sediment. About two pounds of molasses, boiled with the mangold wurzel, will much improve this beer.

Beer from potatoes has been successfully manufactured; although, at present, this would be but substituting one scarce article for another. We, however, give the receipt as practised in France. Boil one hundred weight of peeled potatoes in eleven gallons of water, and mix them into a batter. At the same time, let seven pounds of malt be mashed in a gallon of tepid water, which add to the potatoe vat at the temperature of 144 degrees; stir the whole well together, cover it, and let it remain three or four hours. Then boil it for half an hour with two pounds of hops, strain it through a sieve, and when at 59 degrees of heat, set it with a quarter of a pint of yeast; when fermentation commences, skim the beer, and draw it off into a cask, where the fermentation should be completed. The beer thus produced, after being bottled, has been found greatly to resemble Paris beer.

In certain parts of Ireland, an excellent beer has been brewed from parsnips, by a process somewhat like the foregoing, except that no malt is used; the bitter employed is hops.

Chemistry has, of late, contributed to the economy of malt in a beautiful research. Thus, Mr. Septimus Riese suggests, that the weight of extract of malt may be increased by simply adding *diastase* to the second wort, to convert the remaining starch into sugar. This is done by the addition of a portion of the malt, (which contains *diastase*), previous to mashing a second time. In a brewing of thirty quarters, Mr. Riese would take twenty-nine quarters for the first mash, and add the remaining quarter to the second; and there would be such an increase as to warrant him in advising its adoption by all brewers and distillers.

FRANK FAIRLEIGH;

OR, OLD COMPANIONS IN NEW SCENES.

By F. E. S.

CHAP. XI.

WHAT HARRY AND I FOUND WHEN WE LOST OUR WAY.

On the afternoon of the day after Lawless's wine-party, Oaklands and I were walking down to the stables, where his horses were kept, (he having, in pursuance of his plan for preventing my over-reading myself, beguiled me into a promise to ride with him,) when we encountered Archer—

"I suppose you have heard the news *par excellence*," said he, after we had shaken hands.

"No," replied I, "what may it happen to be?"

"Only that Lizzie Maurice, the pastry-cook's daughter, disappeared last night, and old Maurice is going about like a distracted creature this morning, and can't learn any tidings of her."

"What, that pretty girl with the long ringlets, who

used to stand behind the counter?" asked I. "What is supposed to have become of her?"

"Yes, that's the young lady," returned Archer; "and all that's known about her is, that she waited till her father went out to smoke his pipe, as he usually does for an hour or so every evening, and then got the urchin who runs of errands to carry a bundle for her, and set out without saying a word to any one. After she had proceeded a little way, she was met by a man muffled up in a cloak, who took the bundle from the boy, threw him a shilling, and told him to go home directly. Instead of doing so, however, he let them go on for a minute or two, and then followed them. They went at a quick pace along one or two streets; at length turned down a lane, not far from the Magdalene, at the bottom of which a gig was waiting. Another man, also muffled up, was seated in the gig, into which the girl was handed by her companion, who said to the second man in a low tone, 'All has gone well, and without attracting notice,'—he then added in a warning voice—'Remember, honour bright, no nonsense, or'—and here he sank his voice, so that the boy could not catch what he said; but the other replied, 'On my word, on my honour!'—They then shook hands, the second man gathered up the reins, drew the whip across the horse, which sprang forward at speed, and they were out of sight in a moment. The man who was left gazed after them for a minute or so, and then, turning briskly on his heel, walked away, without perceiving the boy, who stood under the shadow of a door-way. On being questioned as to what the men were like, he said that the first kept his face entirely concealed, but he was rather tall, and had black hair; the second was a stout man, with light hair, and a high colour—for a dark lantern which he had with him happened to throw its light on his face, as he was lighting it."

"At what time in the evening did all this take place," inquired Oaklands.

"Between nine and ten," replied Archer.

Oaklands and I exchanged glances; the same idea had evidently struck us both.

"Has any one seen Wilford this morning?" asked Oaklands.

"Seen him?" returned Archer, "yes, to be sure, he and Wentworth have been parading about arm in arm all over the town; they were with me when I met poor old Maurice, and asked him all sorts of questions about the affair. Wilford seemed quite interested in it."

"Strange!" observed Oaklands, musing. "I don't make it out. I would not willingly wrong, even in thought, an innocent man. Archer," he continued, "you have a shrewd keen wit, and sound judgment; tell me, in confidence, man, who do you think has done this?"

"Nay, I am no diviner, to guess other men's secrets," replied Archer; "and these are subjects about which it is not over safe to hazard conjectures. I have told you all I can learn about it, and it is for you to draw your own conclusions; it is no use repeating things to you, of which you are already aware: I might as well tell you dogs bark and cats mew; or that Wilford has black hair, and Wentworth is a stout man with a high colour; or any other well-known truism,—but I am detaining you—good morning." So saying, he shook hands with us, and left us.

After walking some distance in silence, Oaklands exclaimed abruptly, "It must be so! it is Wilford who has done this thing—you think as I do, do you not, Frank?"

"I am sure we have not evidence enough to prove it," replied I; "but I confess I am inclined as a mere matter of opinion to agree with you, though there are difficulties in the way, for which it is not easy to account. For instance, why should Wilford have gone to that party last night, instead of remaining to carry out his schemes himself; by which he incurred the additional risk of entrusting their execution to another?"

"That is true," said Oaklands, thoughtfully, "I do not pretend to understand it all clearly, but somehow I feel a conviction that Wilford is at the bottom of it."

"You should recollect, Harry, that you greatly dislike this man,—are, as I conceive, prejudiced against him,—and are therefore, of course, disposed to judge him harshly."

"Yes, I know all that, still you'll see it will come out sooner or later that Wilford was the man. Her poor old father! I have often observed how he appeared to doat upon her, and how proud he was of her—his pride will be converted into mourning now. It is fearful to think," continued Oaklands, "of what crimes men are guilty in their reckless selfishness! Here is the fair promise of a young girl's life blighted, and an old man's grey hairs brought down with sorrow to the grave, in order to gratify the passing fancy of a heartless libertine." He paused, and then continued, "I suppose one can do nothing in the matter, having no stronger grounds than mere suspicion to go upon?"

"I should say, nothing likely to be of the slightest benefit," replied I.

"Then the sooner we get to horse the better," returned Oaklands; "hearing of a thing of this kind always annoys me, and I feel inclined to hate my species: a good gallop may shake me into a better humour."

"And the dolce-far-niente?" I inquired.

"Oh! don't imagine me inconsistent," was the reply; "only somehow, just at present, in fact ever since the breeze last night, I've found it more trouble to remain quiet than to exert myself; so if you would not tire me to death, walk a little faster, there's a good fellow."

After a brisk ride of nearly two hours along cross roads, we came out upon a wild heath or common of considerable extent.

"Here's a famous place for a gallop," exclaimed Oaklands; "I never can make up my mind which is the fastest of those two horses; let's have a race, and try their speed—do you see that tall poplar tree, which seems poking its top into the sky, on the other side the common? that shall be the winning post; now, are you ready?"

"All right, go ahead," replied I, bending forward, and giving my horse the rein. Away we went merrily, the high-couraged animals bounding beneath us, and the fresh air whistling by our ears, as we seemed to cut through it. For some time we kept side by side; the horse Oaklands rode was, if anything, a finer, certainly a more powerful animal than the one on which I was mounted, but this advantage was fully compensated by the fact of his riding nearly a stone heavier than I did. We were therefore on the whole very fairly matched.

After riding at speed, as well as I could reckon, about two miles, Oaklands to his great delight had gained nearly a horse's length in advance of me, a space which it seemed beyond my powers of jockeyship to recover. Between us, however, and the tree he had fixed on as our goal, lay a small brook or water-course, along the banks of which the ground became soft and marshy. In crossing this, the greater weight of man and horse told against Oaklands, and gradually I began to creep up to him. As we neared the brook, it struck me that his horse appeared to labour heavily through the stiff clay; now or never, then, was my opportunity, and shouting gaily, "Over first, for a sovereign; good bye, Harry," I gave my horse the spur, and putting him well at it, cleared the brook splendidly, and alighted safely on the further bank.

Determined, if possible, not to be outdone, Harry selected a place in which by crossing he could contrive to cut off a corner, and thus gain upon me considerably. In order to accomplish this, it was necessary for him to take his leap at a spot where the brook was some feet wider than ordinary; relying, however, on the known good qualities of the animal he rode, he resolved to

attempt it. Settling himself firmly in his saddle, he got his horse well together, and then throwing up his whip hand, and (as Lawless would have termed it) "plying the gaffs" eagerly, he charged the brook at full speed.

It was a well-imagined and bold attempt, and had his horse been fresher, would have succeeded in winning him the race; but we had kept up a fair pace during the whole of our ride, and now our gallop across the common, and more particularly the exertions Oaklands had made in crossing the marshy ground, to preserve the advantage he had gained, had tried his horse's wind considerably. Still, however, the noble animal strove to the utmost of its power to answer the call made upon it, and by a vigorous effort succeeded in clearing the brook; but the ground on the other side was rugged and broken, and, apparently exhausted by the exertion he had made, he stumbled, and after a slight struggle to preserve his footing, fell heavily forward, pitching Harry over his head as he did so.

Fortunately the ground was soft and clayey, and neither man nor horse seemed to have sustained any injury, for I had scarcely time to draw rein, ere they were on their legs again, and as Harry's first act was to spring lightly into the saddle, I determined to secure the race at once; and cantering up to the poplar tree, which was now within a hundred yards of me, I snapped off a bough in token of victory. As I turned back again, I observed that Harry had dismounted, and was examining his horse's foot.

"Nothing wrong, is there?" asked I, as I rejoined him. "Yes, everything's wrong," was the reply; "you've been and gone and won the race, you villain you,—I've tumbled nose and knees into a mud-hole, and spoiled my white cord oh-no-we-never-mention-ums,—and 'the Cid' has wrenched off one of his front shoes in the skrimmage."

"And that's the worst of all the misfortunes," said I, "for here we are some ten or twelve miles from Cambridge, at least, in a region utterly unknown, and apparently devoid of inhabitants; so where we are to find a smith passes my poor skill to discover."

"You're wrong about the inhabitants, I flatter myself," replied Harry. "Do you see the faint white mist curling above those trees to the right? I take that to be smoke; where there's smoke there must be fire; fire must have been kindled by some human being or other—through that individual we will endeavour to obtain an introduction to some blacksmith, conjointly with sufficient topographical information to enable us to reach our destination in time for a certain meal called dinner, which has acquired an unusual degree of importance in my eyes within the last hour or so. I have spoken."

"Like a book," replied I, "and the next thing is to bring your sapient deductions to the test of experiment.—There is a cart-track here, which appears to lead towards the smoke you observed; let us try that." So saying, I also dismounted, and throwing my horse's bridle over my arm, we proceeded together on foot, in the direction Oaklands had indicated.

Ten minutes' walking brought us into a rough country lane, winding pleasantly between high banks and green hedges, affording an agreeable contrast to the flat unenclosed tracts of corn land so general throughout Cambridgeshire. After following this lane about a quarter of a mile, we came upon a small retired ale-house, surrounded by trees. As we approached the door, a stout vulgar-looking woman, dressed in rather tawdry array, ran out to meet us; on coming near, however, she stopped short as if surprised, and then re-entered the house as quickly as she had left it, calling to some one within as she did so. After waiting for a minute or two she came back, accompanied by a tall disagreeable-looking man in a velvet shooting jacket, with a remarkably dirty face, and hands to match.

"Is there a blacksmith living any where near here, my good man?" inquired Oaklands.

"Mayhap there is," was the reply, in a surly tone.

"Can you direct us how to find him?" continued Oaklands.

"What might you want with him, when you've found him?" was the rejoinder.

"My horse has cast a shoe, and I want one put on immediately," replied Oaklands, who was getting impatient at the man's unsatisfactory, not to say insolent, manner.

"Mayhap you won't get it done in quite such a hurry as you seem to want! There's a blacksmith lives at Stony End, about five miles further on. Go straight up the lane for about three mile, then turn to the right, then twice to the left, and then you'll see a finger post that aint got nothing on it:—when you come to that—"

"Which I never shall do, depend upon it," replied Oaklands. "My good man, you don't imagine I'm going to fatigue myself and lame my horse by walking five miles up this unlucky lane, do you? If things really are as bad as you say, I shall despatch a messenger to summon the smith, and employ myself in the meanwhile in tasting your ale, and consuming whatever you may happen to have in the house fit to eat."

I observed that the landlord and his wife, as I presumed her to be, exchanged very blank looks when Oaklands announced this determination. When he ceased speaking, she whispered a few words into the ear of the man, who gave a kind of surly gruff reply, and then, turning to Harry, said, "Mayhap I'll shoe your horse for you myself, if you'll make it worth my while."

"You will? why, I thought you said there was not a smith within five miles?"

"No more there aint, only me."

"And you've been worrying me, and tiring my patience all this time, merely to secure yourself a better bargain?—Oh, the needless trouble people give themselves in this world! Shoe the horse, man! and make your own charge; be sure I'll not complain of it, only be quick," replied Oaklands.

"Praps that worn't all," returned the fellow gruffly, "but if ye be in such a mighty hurry, bring 'nn along here, and I'll clap a shoe on 'un for ye in a twinkling."

So saying he led the way through an old gate, and down a stable yard behind the public-house, at the bottom of which, under a kind of half barn half shed, was a blacksmith's shop, fitted up with a forge, and other appliances for shoeing. Our conductor, who, having divested himself of the velvet jacket, which he replaced with a leather apron, seemed now much more in his proper element, displayed greater quickness and skill in making and applying the shoe, than from his previous conduct I should have anticipated; and I began to flatter myself that our difficulties were in a fair way to be got over.

I was drawing up the girths of my horse's saddle, which had become somewhat loosened from our gallop, when Oaklands, who had been sitting on a gate near, industriously flogging his boot with his riding-whip, jumped down, saying: "If you'll stay with the horses, Frank, I'll go and see if I can get some of that worst of this mud brushed off."

"Better stay where you are! I shall a' done directly," observed the smith; "you aint wanted at thur house, I tell yer."

"You should stick to your original trade, for your manners are certainly not calculated to fascinate customers, my friend," replied Oaklands, walking towards the inn.

The man muttered an oath as he looked after him, and then applied himself to his work with redoubled energy. Above ten minutes had elapsed, the shoe was made, fitted to the hoof, and the process of nailing on nearly concluded, and still Oaklands did not return. I was tying my horse's rein up to a hook in the wall, with the intention of seeking him, when I heard the noise of wheels in the lane, followed immediately by the

clatter of a horse's feet, ridden at speed—both sounds at the moment ceased, as if the parties had stopped at the inn-door. The blacksmith also heard them, and appeared for a moment uncertain whether to continue his work or not; then, uttering an impatient exclamation, he began twisting off and clenching the points of the nails, as though his life depended on his haste. Perceiving that Oaklands's horse would be ready for him to mount directly, I turned to unfasten my own, when the sound of men's voices raised high in angry debate became audible; then a confused noise as of blows and scuffling ensued, mingled with the screams of women, and immediately the blacksmith's wife ran out, calling to him to hasten in, for that "they had come back and quarrelled with the strange gentleman, and now they were fighting, and there would be murder done in the house."

Without waiting to hear more, I ran hastily up the yard, followed by the blacksmith and the woman. On reaching the front of the house, I perceived, waiting at the door, a gig, in which was seated a man, dressed in a suit of rusty black, while, under the shade of the trees, a boy was leading up and down a magnificent black mare, which I instantly recognised as the identical animal Wilford had become the possessor of, in the manner Archer had related to me. The sounds of blows and struggling still continued, and proceeded, as I now ascertained, from the parlour of the ale-house. As the readiest method of reaching the scene of action, I flung open the window, which was not far from the ground, and without a moment's hesitation leaped into the room.

Stories from the Dramatists.

A VERY WOMAN. (*Massinger.*)

THERE was once a certain viceroy of Sicily, who had two children, the one of whom, a daughter, was called Almira, the other, a son, Don Pedro. At the same time there was in Sicily a duke of Messina, who had a son, Don Martino, and a daughter, Leonora; the first of whom was enamoured of Almira, and the second was the object of Don Pedro's love. Now it chanced that Don John Antonio, prince of Tarentum, a very accomplished nobleman, and one greatly beloved by Don Pedro, came also at that time, and paid court to Almira. But she, carried away by the excessive violence of her love for his rival Martino, was not only unmindful of his high qualities, but even of the duties incumbent upon one of her rank; so that she treated him with such discourtesy, as should never have been shown to a poor enemy, much less to a noble and well-born suitor. This Don John Antonio, therefore, finding his suit not likely to prosper, but only to procure him shame and vexation, resolved to give over so fruitless an undertaking, and quit the city (Palermo) wherein his mistress dwelt. To this end he requested of Don Pedro that he would procure him an interview with Almira, wherein he might take leave of so cruel a lady. Don Pedro sought his sister, and besought her to grant so small a favour, but, though he was seconded by his mistress, Leonora, who waited on Almira, he could not persuade her to consent. Nay to such a height did she carry her scorn of Antonio, and her love of his rival, as to take a jewel, which the former had previously sent her, and give it to the page of the latter, in recompense of some trifling service. So great an outrage excited the fraternal wrath of Don Pedro, who rated his sister soundly; nor was his mistress, Leonora, backward in reproaching her also; but she

made light of them both, and presently afterwards, when Don Martino came to visit her, complained to him of what she called an unreasonable request, and promised that her love should be his, and his alone, though all the kings of Christendom should seek it; with which assurances she left him, taking Leonora with her. Now Don Martino, being to the full as jealous as she was fond, and dreading lest so violent love should have as violent change, resolved within himself to get Antonio despatched from Palermo with what haste he could, so that he might incur no further danger in that quarter. In such a mood, as fate would have it, he met with Don Antonio, and presently, either being moved thereto by choler, or by the hope of driving him from the place, began to speak jeeringly to him, wondering, as he said, how so great a prince could endure such frequent slights with so stoical a composure. But this not taking effect, he called to him his page, and bade him show to Antonio that very jewel which he had given to Almira, and sho to the page. To this Antonio very quietly replied that he had made no contract with Almira, as to what use she should apply his present to; whereupon Martino, being, like choleric men in general, made more passionate by his rival's calmness, irreverently struck him on the face. So great an insult did not go unpunished, for Don Antonio drew his sword, and, despite Don Martino's efforts, soon stretched him, bleeding, on the ground. Almira, hearing the noise of their struggle, rushed in, and, finding her lover to all appearance dead, snatched his sword and wounded Don Antonio, who, on his part, offered no hindrance to her fury, saying that he should esteem himself happy in dying by her hand. To that place there speedily came the viceroy and his son Don Pedro, with Don Martino's father, the duke of Messina. And, while Almira and the duke implored the viceroy to grant them vengeance, the one for a lover, the other for a son, he gave orders to keep Antonio in safe prison, being resolved to give him a fair trial. Then, turning to the fallen Martino, he found that there was yet some life in him, whereon he ordered him to be tended with the greatest care, that so, if possible, two lives might be saved.

Now there was in Palermo a very learned doctor, by name Paulo, who, having examined Martino's wound, pronounced that his body would ere long recover its health, but that his mind, being disturbed by so grievous shocks, would not so speedily retake its former vigour, although with care and caution it might be restored also. To this end he ordered that no one, not even Almira or the duke, should have access to the wounded man, lest the excitement consequent upon their presence should increase his malady. Almira, lost in grief, with difficulty consented to the arrangement, vowing that, should Martino die, she would wear weeds for him ever afterwards. Meanwhile Don Pedro had conspired with the captain of the prison wherein Don Antonio was, to let the prisoner escape, to which the captain not only consented, but offered to escape with him. Don Antonio, being won over by the entreaties of his friend, and being got out of the harbour, met with a slaver; whereupon, seeing a good opportunity for returning to Palermo, he and his companion, the captain, disguised themselves as slaves, and put themselves into the slave-merchant's hands, that so they might be sold in the slave-market, without the knowledge of their friends in the city.

Now when the news of their escape reached the duke of Messina, grieved as he was for his son's sake, it so enraged him that he would accuse the viceroy and Don Pedro of conniving at the stratagem; and so, to punish the latter, gave orders to Circolo and Borachia, a foolish pair in his household, that they should keep strict watch upon Leonora his niece, that her lover, Don Pedro, should have no access to her. This service they readily promised to perform, and Circolo, for the better effecting of it, went down to the slave-market to buy a servant, who might assist his wife Borachia in her watch,

wherein, as luck would have it, he bought Antonio, not knowing him under his disguise. The doctor, Paulo, going down also to the market, bought the captain, and an English slave, for which the slave merchant was induced to present him with another slave, a poor, lean, ill-favoured wretch, who had crept into his company, no one knew how. Circulo now charged his slave Antonio to obey Borachia in all things, but on no account to let her have wine, she being too much given to drink; but Don Pedro coming soon afterwards, and not knowing his friend again, entreated him to carry a letter to Leonora, which, when Antonio had promised to do, he set about by giving his mistress wine, of which she drank so freely as to lose reason, so that she made love even to her slave. First then, Almira and Leonora, the former in profound grief, came walking by, so that Antonio could give the letter to Don Pedro's mistress; which being done, she thanked him, and promised to be in the garden at midnight, if Don Pedro could find means of meeting her. She also offered money to Antonio, which he refused, having done the same before by Don Pedro, in no noble and yet modest a manner, as to win that gentleman's especial approbation.

When Almira and Leonora were gone, the first began inquiring after that handsome man, with whom her friend had been speaking, and, on being told that he talked and acted as nobly as he looked, made some comments on him, and in particular inquired if he would ever come again, so as greatly to surprise Leonora, who, but a few minutes before, had seen her in the profoundest grief.

Now Martino, being healed in his body, but still diseased in his mind, was wont to bemoan himself much for the evil which he had done to Don Antonio, lamenting greatly that he should have provoked so noble a gentleman, and one so superior to himself in moderation and good breeding. Paulo, the doctor, seeing that his patient would take no consolation from man, prepared attendants, with trap-doors and machinery, to play a pageant before Martino, that so his diseased mind might take their counsels to be those of heaven. First, therefore, he caused a friar to appear before Martino, and tell him a feigned story, how that himself in former years had slain a man on smaller provocation, yet had by hearty repentance so purged his conscience as to be quiet in his mind. This failing to satisfy Martino, and on the contrary, only determining him to kill himself, that so he might do justice to Antonio, there next appeared to him an old soldier, of whom he inquired how he might best restore his honour, whereto he received answer that to live and make reparation was the most honourable course. This good counsel, coupled with sweet music and the melody of harmonious voices, did by degrees compose his unsettled thoughts, so that he professed himself quite cured, and longed only for Don Antonio, with whom he would fain be reconciled.

Meanwhile Almira, in conversation with her friend Leonora, would ask much and often about that handsome slave whom she had seen; wondering if he were a Turk or some enslaved Christian; or, being a Turk, yet a man of high rank and parentage. At length, prompted by curiosity, and by a feeling which she could not well understand or excuse to herself, she sent Leonora for Borachia, being minded to inquire whence the slave came. Borachia, being not yet sober, stated him to be the Grand Turk's son, but volunteered to send him that he might speak for himself. Now when he was come, he brought word that Don Pedro awaited Leonora in the garden, so that, on her going, Almira and he were left together. Thus they stood silent for some minutes, he with downcast looks as fearing to be discovered, she half ashamed of her new passion, yet prompted to question further. At length she broke silence, and finding in all his answers an indescribable modesty and gentleness, mingled with such marks of high breeding as could belong only to a man of high birth, besought him to tell her by what sad chance he had

fallen to so low estate. Then he, being forced to speak, told his real history without disclosing his name, saying, that he was a Biscayan of noble birth; that he had loved a lady of equal rank and chiefest excellence, and had paid court to her with such nobleness and tenderness as became her beauty and his love; that she, despising his great affection, and casting his most precious love-gifts to pages and servitors, had preferred to him a rival of coarse manners and choleric temper; that this rival, being by her suborned and set on, had insulted him in full day, and that he, provoked beyond all patience by such outrage, had slain his rival on the spot, for which deed being compelled to fly his country, he had been captured by a pirate, and so sold into slavery. This moving relation, with the added pathos of voice and gesture, and bearing so directly on Almira's own history, did not only exhibit her to herself in so unfavourable a light, but did also so increase her admiration for the supposed slave, that she could with difficulty control her passionate emotion; but her brother and Leonora returning at that moment, she begged them to walk aside a brief space longer, no less to their astonishment than to Antonio's joy. Then she besought him, as he had so moved her with the story of his love, to tell his name; whereupon he, not daring yet to trust her altogether, said that he feared to comply, because he bore a name, which, as men told him, she hated more than any other. But she, pressing him still further, and saying that any name would be welcome to her for his sake, he declared his name to be Don John Antonio. She, suspecting nothing, though somewhat astonished withal, said that she should esteem him none the less for that: that he deserved to be, and should be, her friend; whereupon they parted. But so rapt was she in thoughts of him, that when Circulo came to tell her of Martino's recovery, and to announce a visit from that gentleman to her, she could give him but broken answers, all foreign to the purpose; yet at length collected herself sufficiently to say that Martino should not come to her but by breaking through the doors; which saying the astonished Circulo went quickly to report.

Meanwhile that ill-conditioned slave who had been presented to Doctor Paulo, but who was indeed a pirate in disguise, had plotted with his fellow-pirates how to carry off Almira and Leonora by night, and sell them to the Grand Turk. For, by making himself to be despised of all men, he had gained free scope for observation, and had spied out the whole nakedness of the place, so that he did not doubt being able to effect his plans. Now, as luck would have it, Almira had written a letter to Antonio, and thrown it to him over the wall, wherein she told him of her great love for him, and of her sorrow for the wrong she had done his namesake, begging him, at the same time to meet her that night in the garden. Antonio marvelled much at this letter, wondering how there could be such levity in so great a lady, as to make her love that man in the degradation of slavery, whom she had despised in the pride of power. Nevertheless, thinking that he ought not to quarrel with a change which made so well for him, he resolved to take the fortune which the gods had provided for him. Now, when Almira was come into the garden with Leonora and two waiting women, who were much astonished to see her so bravely dressed, she sent one of them to fetch Antonio, being so impatient that she fancied him longer in coming than he should have been. At this crisis the pirates, who had made their preparations, rushed upon the women and strove to carry them off, nor would have failed, but that Antonio coming in at that moment, snatched a sword from one of them and defended the ladies right manfully. The noise of the scuffle being great, Pedro, Circulo, and others, came running in speedily, and overpowered the pirates, though not till Antonio had performed such prodigies of valour, as to fill the heart of Almira with yet greater love.

The pirates being secured, Don Pedro would have

Antonio, whom he still thought a slave, go with him to court to be rewarded for his courage. Almira, also, would go with them, saying that she had somewhat to tell to her father, which had better be said quickly. When they arrived in the audience chamber, they found Don Martino there before them, he being now quite recovered. It was looked for by all the bystanders that he and Almira would have embraced each other, but, despite all their previous professions, they behaved to each other with perfect coldness, and only uttered a few unmeaning compliments. Moreover, Martino said, before the whole court, that he had now laid aside all thoughts of woman's love, which during his past life had filled him full of evil fancies, vain imaginings, hot-burning jealousies, and proud fits of cholera, but which, in the new life he had received from Doctor Paulo, should be exchanged for such good qualities and honest actions as might constitute a perfect man; with which speech he left the company in great amazement at his changed behaviour. Nor did Almira take his conduct amiss, but only said that, fortunately for women, all were not of his opinion, and that she could find a man, as proper in mind and person as, but more enduring in affection than, Don Martino. To which her father having replied that he would confirm her choice if it were fitting, she made answer that she would not choose from those who owed their standing to the deeds of their ancestors, nor would she seek a wealthy lover, since wealth came to her by right, being the viceroy's daughter, but would single out a man who was the founder of his own fame, and was a fortune in himself, namely, that courageous slave who had saved her life. The viceroy, greatly enraged at her choice, could with difficulty be prevented from killing Antonio on the spot; but, being somewhat pacified, ordered him to prison. But being got there, it gradually transpired that he was the prince of Tarentum, who had thus disguised himself, once more to behold the lady of his love. So being taken out of prison with great honour, he was married to Almira, who could scarce excuse herself for that she had refused a prince, and offered herself to a slave. Nevertheless, allowing the all-powerful sway of love, she lived happy with her Antonio, thinking that she could best repair her fault by redoubling her affection. Yet, warned by her example, the people of Palermo learned to distrust that excessive passion, which, like a summer torrent, exhausts itself in vast outpourings, and favoured rather that calm current of affection down which Pedro and Leonora had sailed, whose stream, far from diminishing in volume, was always full and strong, because always supplied by the inexhaustible resources of two constant hearts.

TRUTTA.

(Translated from the German of Langbein.)

VALENTINE, meanwhile, in the corner of the hut, devoured the remainder of the sweetmeats with which he had provided himself for his journey into the black forest, for he was still child enough to like nothing better than pastry.

After the meal was ended, the witch prepared a couch for her guests which they were to share. The student was afraid that Trutta would slip out of her chest, lay herself down by him, and disgust him with her caresses; but, contrary to his expectations, she drew herself like a snail into her house, the witch bade them good night, and withdrew to her sleeping apartment followed by her whole black suite.

Valentine had great need of the refreshment of sleep before his meditated flight; he stretched him-

self on his couch, and Trutta with her house remained where they were. He had scarcely closed his eyes when the chest sprang from the bench, hopped over the floor like a magpie, and laid itself down by his side. Valentine ground his teeth (with rage, for he feared every moment his disgusting bed-fellow would get into bed; she spared him this, however, and kept herself close in her shell, and he soon heard her snoring.

"Now is my time," thought Valentine, "to withdraw secretly;" he crept out of bed, opened the door softly, and found himself in the open air. There was no moon, but the millions of stars in the blue sky enabled him to distinguish a path leading away from the witch's hut in the desolate waste. He took it without a moment's delay, and ran rapidly over hedge and ditch; but he was startled by hearing the bleating of a he-goat close to him, and the next moment he heard the mewing of a whole herd of cats; he looked round to see whence it came, and saw the witch's whole army of cats saddled and bridled, and she was herself riding on a black goat.

"Hollo, hollo! my worthy guest, where are you going?" said she: "you have forgotten something. You have left Trutta behind you, you rascal!"

'Twas in vain that he tried to escape; she flung the chest on his back, and the goblin came out and pinched and beat him unmercifully. The witch and the cats disappeared, and he was left alone with Trutta.

"One ought never to close one's eyes when there is such a harebrain as you to take care of," said she: "but now, whether you are tired or not, you shall carry me the whole night, and you shall have no rest till we arrive in Frankfort-on-the-Maine."

"And what shall we meet with there?" growled Valentine.

"Fortune, or Misfortune, according as you conduct yourself," said she; "as I have been appointed your mistress, I shall introduce you into the house of a rich merchant, and it will depend entirely on yourself whether you become a happy man by diligence and honesty, or whether you adorn the gallows as an incorrigible vagabond."

Valentine gulped down this severe sentence; he, however, made the natural objection, that it would be difficult for him, without testimonials and letters of recommendation, to gain the confidence of a member of such a distinguished body of men as the merchants.

"That is my affair," said Trutta; I have already prepared the necessary papers for you. You will deliver them, and will be engaged in the counting-house, where you must absolutely rise from the very lowest step. You will not get rid of me till your improvement is firmly based; but, that you may not become the common talk, or be avoided for my sake, both I and my dwelling shall be invisible."

They took the direct road to Frankfort; Trutta had no friends on this road with whom she could pass the night; and therefore, when her bearer became tired, they were obliged to enter into public houses. She was generally so good as not to show herself; but, when the rascal, in one house, engaged in a game of dice, in another got tipsy, and in another trifled with the host's daughter, down came the magic chest like a bomb: the mistress came out and punished the spendthrift with reproaches and blows.

Notwithstanding these quarrels, she presented him, at their last quarters before arriving at Frankfurt, with a new suit of clothes; gave him the promised testimonials, and ordered him to deliver them to the rich merchant, Peter Lütkins, whose dwelling she pointed out to him. The chief of these papers was a letter to the merchant from his own father, whose handwriting was more cleverly imitated than it had ever been by his good-for-nothing son, when he had sometimes wanted his father's signature to a false bill.

Herr Peter, an honest old German, had lately lost a very faithful clerk by death, and wished to fill the empty stool in his counting-house as soon as possible. It is true there were plenty of idle people about him; with every one there was a but,—one loved play, another wine, and so on: besides, Herr Peter had the whim of not liking to entrust his affairs and money to young men who had extensive connexions in the town; for this reason he wished to engage a foreigner. He had just taken up his pen to write to a correspondent on the subject, when Valentine appeared, and gave him his father's letter. Herr Peter, to whom the celebrated merchant, Altmayer of Leipzig, was well known, esteemed himself happy in seeing the son of such an excellent man, and took the rogue into his service without hesitation.

Valentine turned his best side outwards at first; he was orderly and diligent in his affairs, and accomplished them with a dexterity in which he was not wanting when he pleased.

Trutta, who had entered Herr Peter's house invisibly on his back, and had taken up her abode in a corner of her pupil's room, said a few friendly words to him every night when he went to bed; and, with this exception, she saw nothing of him, and even this soon ceased.

When this silence had continued for many weeks, he began to fancy that she had withdrawn quietly, because she saw it was unnecessary to tutor him any longer: he placed his ear to the chest, knocked softly upon it with his fingers, but nothing moved inside. There seemed no danger now in giving way to his inclinations; he commenced one day when he was alone in the counting-house, with trying the skeleton-key which he had brought from Leipzig, into his master's iron chest: the lock opened without difficulty; but, as he bent down into the deep chest to seize a handful of gold, the lid was clapped down with violence upon him: he stuck there as though he were in a trap, all his endeavours to escape from this dilemma were in vain.

While he was struggling in despair, a new terror assailed him; his tormentor sitting above him on the lid looked down into the opening with an angry countenance, seized him by the ear, shook him well, and cried—"Ha, rascal! are you there? shall I crush you this moment like a worm—or will you promise me faithfully to be from this time forth an honest fellow? One way or the other we must separate; for I am tired of sitting for ever in my prison house for your sake, and of being always obliged to keep a watchful eye upon you, you gallowbird."

In this necessity he promised what the Fury desired: she took pity on him, but threatened to ruin him without mercy if she ever caught him at such tricks again.

Master Mammat, said she, had taken it into his

head either to make him happy, or to plague him for ever: he wished to show the arrogant Famulus Wagner that he was not the unimportant spirit he took him for, and that any adventurer could not assail him with nicknames, without finding that evil as well as good might come of it.

"I am curious to know what happiness is in store for me, if I submit to all this," thought Valentine, when he saw that his old course of life was entirely closed to him. He thrust his bosom sin with stern determination from him, was the most industrious clerk in Herr Peter's counting-house, withstood every temptation, gained his master's confidence, and received a handsome present from him after prudently and faithfully concluding a very important business. This advantage which he had gained in a right manner did him good. It grew into a habit with him not to help himself with tricks and shifts, and after the lapse of half a year he withstood a severe test, for he had an opportunity of embezzling a large sum without fear of discovery, but he resisted it manfully, and without taking any particular merit to himself, for he concluded he could not have acted otherwise.

In the meantime the empty chest stood immovable in its place, and in no way betrayed whether Trutta was inside or not. On the evening of the day when the converted sinner gave such a signal proof of his amendment, his attention was drawn by a slight movement within the hated boards.

With horror which he could not avoid feeling, (as he dreaded the appearance of the old woman,) he looked towards the corner, in which Trutta's little house stood, covered with spiders' webs, and saw the cover slowly raised. But, heavens! what a change! A maiden, lovely and mild as an angel, came out, and invitingly threw him a kiss. He started forward to embrace her, but she sunk as suddenly as she had appeared, leaving the air perfumed with roses.

Valentine stood for some moments like a statue; he then raised the chest (which he had formerly avoided touching) on the table; looked through every chink, but saw nothing but a hollow shell. He passed a sleepless night—the lovely image hovered constantly before his eyes—how was it possible to recal the original?

The following day the lovely appearance was continually in his thoughts; he imagined she might be the forerunner of a living maiden, whom the reconciled spirit of the Black Forest intended for him.

This agreeable fancy animated and urged him on to greater improvement; in all that he did he imagined himself observed by his spirit bride. Months and weeks, however, elapsed before it pleased her to embody herself, or even to be seen in the former incorporeal form. Discontented at this, it gave him but little joy to be promoted to the office of book-keeper; every number that he wrote reminded him of his trials, which he was afraid were like the blanks of a lottery-ticket, and would never turn up a prize.

One day, when he mused in this manner, a carriage drew up before the door. Herr Peter was called out of the counting-house, and soon afterwards one of the assistants brought the news that the master had company; that his sister had arrived, with her daughter, from Strasburg.

"Oh, that's excellent!" cried one of the clerks. "The old man won't be sitting in the corner all

day to watch us, and we shall become acquainted with a maiden who is said to be a miracle of beauty."

"She cannot be equal to the image I bear in my heart," thought the melancholy book-keeper; and he obeyed the call to dinner very indifferently, though he knew that he should meet the beautiful Strasburgher.

He entered the dining-room, and started back in astonishment; for in the lovely stranger he recognised the aerial visitor of the chest.

The young Strasburgher also changed colour when she saw him, and was silent and embarrassed.

Valentine, who as book-keeper had the privilege of speaking at his master's table as well as at other times, and generally made use of it, could only answer in monosyllables. "What whim has our Altmayer taken into his head? He is as mute as a fish to-day."

Katchen from Strasburg blushed, for she felt that her presence was the cause of his silence.

The embarrassed book-keeper, who pretended to have a head-ache, felt relieved when dinner was over; he hastened into his chamber, and, looking into the detestable corner, found that Trutta's dwelling had disappeared.

The ladies from Strasburg had agreed to remain a month at Frankfort, and it happened as the reader has already anticipated:—The two young people became familiar with each other, and confessed their love. Herr Peter and his sister, who soon suspected their secret, questioned them, brought them to an acknowledgment without much trouble, and after some slight hesitation consented to their being betrothed.

Intoxicated with joy, the prodigal son wrote to his father, informing him of his good fortune, keeping, however, a cautious silence on his past adventures.

Somedays before the marriage, Katchen jestingly asked her lover to show her his room. He led her into it; she started at the threshold, examined it closely, and then said, "This little room and its furniture seems as well known to me, as if I had seen it somewhere before. It is now some months," continued she, "since one evening I fell into a sort of trance; and, when I came to my senses, I had the idea that I was in a room unknown to me; that I rose from a chest, and saw a youth of your form and features, dear Altmayer, before me. This made me not a little surprised when I saw you for the first time; and my dream is the more remarkable, from my finding this room like what I then saw. Nothing is wanting but the chest; was there ever one standing in that corner?"

Valentine, after some hesitation, answered in the negative; he did not think it advisable to discover his intercourse with Spirits and Kobolds.

The marriage was splendidly solemnized. At table the grateful bridegroom silently devoted the first glass to his friend in the Black Forest, and, a few months after, having to take a journey on business, he made a wide circuit to Mammart's castle, and calling him by his right name, the Spirit appeared, and Valentine thanked him sincerely for the good he had bestowed upon him.

"Right, right!" said Mammart, smiling. "I made an honest man of you by comic severity, and that is much better than if Doctor Faust, the devil's confederate, had overwhelmed you with gold. Go in peace!"

THE MAIDEN AUNT,¹

No. III.—CHAP. IV.

"Oh Frank!" cried Edith, throwing herself on the sofa beside her brother, "I don't like your friend at all!"

"Not like him! Now my dear Edith, that is so like a school-girl—making up your mind that you don't like a man, after two days' acquaintance!"

"I never could like him, if I were to know him for years—besides, I think one knows very well by the end of two days how far it is possible to like a person."

Her brother laughed.

"Now don't tease me, Frank," she pursued; "I am not school-girlish; and really your friend's opinions are so very dreadful, that it would be impossible for me to like him."

"My dear child, he only talks in that manner for the sake of argument. A man always tries to provoke a girl when he wants to draw her out."

"But I do not like to be played with in that manner. Besides, I am quite sure he was in earnest in a great deal of what he said."

"What! in his misanthropy?" asked Frank. "Poor fellow! it is no wonder that he is a little soured; when you know his story, you will understand directly that it is almost impossible for him to take a cheerful view of life. His father died some four and twenty years ago, leaving a widow with three young children, of whom Philip, scarcely then eight years old, was the eldest. Mrs. Everard was a very attractive woman, and her children idolized her. I remember her well,—there was about her that sort of undisguised warmth, nay, almost excitability of manner, which people are apt to consider a sign of deep feeling, and which, when it is accompanied by grace, fluency, and gentleness, makes a woman absolutely irresistible. But, after all, I distrust the sort of thing myself—there's no substance in it. She was the kind of woman that would go into hysterics one hour because something reminded her of her husband, and be the life and queen of a gay circle the next."

"She must have been a hypocrite," said Edith, with the unhesitating decision of eighteen.

"No," replied I; "I have known characters of that stamp in the course of my life, and should say of them, with Byron, 'they are not false, but they are fickle.' There is a fascination in the freedom and nature with which such a woman displays the very feelings which, when real, are reserved and retiring—a fascination which perhaps at first would only be resisted by a mind of unusual refinement; but, as your brother says, 'there is no substance in it.' Shakspeare, who touches everything, has given us the model of such a character in his Lady Anne, 'inconstant, shallow, changing.' Those who quarrel with the picture as *unnatural*, or who would destroy its truth by explaining away either the genuineness of her tears over her husband's corpse, or the sincerity of the weakness with which she yields to the wooing of that very husband's murderer, mistake the intention of the portraits altogether. Its very nature consists in its contradictions, which, to the merely theoretical observer, make it appear *unnatural*—but pray, Mr. Kinnaird, go on with Mrs. Everard's history."

He resumed, "Philip was a boy of unusual talents, and excessively warm affections—you may look incredulous if you please, Edith, but I have all these particulars from the very highest authority. He pos-

(1) Continued from page 302.

tively worshipped his mother. He was sent to school early; and therefore it was not to be expected that, as he grew old enough to observe, the true shallowness of her character should be discovered by him. To him she was enthusiastically affectionate: welcoming him and parting from him with floods of tears, loading him with caresses, insisting on receiving a letter from him at least once a week while they were separated, and indulging him to the very uttermost when they were together. The family arrangements were rather peculiar. Mr Everard was a poor man, and the property which he left behind him did not amount to more than four hundred a year: this he divided equally between the widow and the eldest son, leaving the sole guardianship of the boy in the hands of a friend of tried discretion, and recommending to both, in the most earnest and affectionate terms, the charge of the two younger children. Philip was destined for the church; he was a remarkable boy, and, even from a very early age, fully comprehending the position of the family, he habituated himself to the practice of the strictest personal self-denial. His guardian, from whom I learned these circumstances, told me, that, during a vacation which the boy passed under his roof when not more than twelve years old, his economy was so strict as to attract attention. He was evidently living by system—he refused steadily all the petty luxuries of the table, and either had no pocket-money at all, or, if he had any, never spent it. Mr. Gray, who had no very high opinion of Mrs. Everard, began to suspect that the allowance which he made her for her son's use, was partly appropriated to other purposes—or else that the boy himself was naturally stingy—a thing almost inconceivable. So he called Philip into his study one morning, and questioned him, kindly but closely. The little fellow answered with the utmost simplicity, 'that he had lately read for the first time the letter which his father had left for him, and that, now that he understood exactly how they were all circumstanced, he was trying to accustom himself to live upon as little as possible, in order that there might be money saved to pay for the education of his brothers' (twins, seven years younger than himself). 'For you know,' he added, 'Mamma must of course have her two hundred a year to keep house with, and I must pay for Ralph and Harry's schooling.' Mr. Gray was touched, and promised his assistance in the education of the younger boys; but though Philip thanked him warmly, he appeared to consider the responsibility inalienably his own, and did not relax the strictness of his self-imposed rule. As he grew older, he showed the most passionate love of study, and his soul seemed to be entirely absorbed in the profession for which he was preparing himself. He went to college, and there his merit was great indeed, if it is to be tried by your rule, Miss Forde, and praised proportionately to the temptations which it had to withstand. I believe I may say, speaking plain and unvarnished truth, that he never allowed himself in the smallest expense that was not absolutely necessary—and you must know what that implies, when it describes the life of a youth during his first term at college. He had to contend not merely against the vulgar weapons of ridicule, which have ever found him proof, but against the more dangerous assaults of courtesy, kindness, and friendship. For he had all the qualities which make a man popular—person, manners, conversational power both grave and humorous, high spirits, and love of adventure. Moreover he was by nature peculiarly susceptible of the attractions of society; he never could do any thing by halves—he liked in the morning to shut himself up in his rooms and read for six hours without intermission, and then to spend the rest of the day either in vehement bodily exercise, or complete relaxation and reckless merriment. Think what it must have been to a character of this stamp, to lead a life in which the stern monotony of self-denial and seclusion

was unvaried by a single indulgence! yet I do believe that at this time he was happy—happier than he has ever been since, poor fellow! Every energy of his nature was engrossed and occupied by one object—he was living for a purpose worthy of his entire self-devotion, and the fulfilment of which that self-devotion was sure eventually to attain. 'Every day,' as he once said, on the only occasion on which I have heard him allude to his early trials—'Every day was a battle—but then it was a battle which ended in victory.'

"Oh!" cried Edith, whose expressive countenance had kindled into emotion as her brother proceeded with his story; "you are describing a most noble character! I never should have given him credit for such heroism. And why did he change? Why did not he go into orders after all?"

Frank laughed. "Everard would tell you," said he, "that you are as exaggerated in your praise as you were in your condemnation; and that it is true young-lady philosophy to spring from one extreme to another."

"Well, never mind," returned Edith, impatiently; "I don't want to hear Captain Everard's sharp speeches by proxy; and I do want, very much indeed, to know what happened next."

"He came home for his first vacation," said Frank, "after spending the college term in the manner which I have described to you—came for repose, affection, family comfort—and found that his mother had been married the day before to her younger boy's French master; that she had quitted her home with this scoundrel, and deserted the two poor boys, not only leaving them entirely dependant on their elder brother, but actually leaving unpaid debts for him to discharge! and this without a word of preparation or of farewell; only a note, left for Everard, full of hollow expressions of affection for himself and his brothers, and appeals to him not to resent her having taken the only step which could procure her happiness for the remainder of her life."

"What a woman!" exclaimed I. Edith was speechless with horror. Frank continued his narration.

"It appears that she was infatuated by her passion for this man; and that, devoting herself to him with a weak idolatry, she became a passive tool in his hands, and abandoned her children's interest for his without compunction. His object, of course, was to obtain exclusive mastery of her little income; and with that view he induced her to conceal her intentions till the marriage was actually completed, and they were beyond the reach of remonstrance. He carried her to France; and it is only charitable to conclude that he keeps her in the state of subjection which she deserves, for she has never answered a single letter addressed to her, nor testified the smallest desire to know whether her children are dead or alive."

"Inconceivable heartlessness!" said Edith; "she must be acting under compulsion, and I hope she is thoroughly miserable."

"By this time," pursued her brother, "I suppose Everard has your full sympathies, and you have transferred your hatred for him to his mother. He behaved admirably. Whatever he may have felt, he betrayed it not for a moment; he at once abandoned all his prospects, accepted a commission which was offered to him by a friend of his late father, gave up the whole of his own income for the use of the younger children, and lived upon his pay. He has never since mentioned his mother's name. Doubtless there is a stern and bitter feeling at his heart, all the stronger for being so resolutely suppressed. But now, Edith, is it wonderful that his nature should be a little soured, and his faith in his fellow-creatures a little shaken? For eighteen years of his life he believed his mother to be the very perfection of unselfish tenderness, and would have held it sacrilege to doubt her. Can such a feeling as this be suddenly destroyed without the whole man undergoing a painful and irrevocable change?"

"And his hopes blighted, and his thoughts and course

of life forced to a new and unnatural bent, and the source and spring of all affection in him dried up, as if by burning!—no, indeed! the wonder is that he did not become a misanthrope or a madman."

"I need not have feared your want of sympathy," said Kinnauld, smiling; "as to the rest, you know what a friend Everard has been to me; I owe it to him that I am not an utter scapegrace—most probably that I am alive at all; for you know how his steady friendship extricated me from the worst scrape I ever was in—the duel with that fellow Vincent. Without (I hope) being really ill-disposed, I was open to every temptation, ready for every mischief that came in my way; but for him I believe I should have become a confirmed gambler. I shall be grateful to him as long as I live, as I ought to be; and some day or other perhaps he will do more justice to my feelings towards him than I am afraid he does just now; though, mark you, I do not take all the nonsense he has been talking to you for his earnest opinion."

"Oh! I shall understand him now!" replied Edith; "his bitterness of tone is not only natural, but inevitable. How I hope," she added thoughtfully, "that he may be rewarded by happiness after all!"

The conversation dropped here, for Frank departed to put his letters into the post, and Edith fell into so deep a reverie that I did not like to disturb her.

The week which was to be endured (the expression is scarcely too strong, when applied to the feelings of a girl of eighteen awaiting her first bull) ere the important Thursday should arrive, passed away much as might have been anticipated. Frank and Captain Everard were perpetually with us; but, though Edith had become charity itself towards the latter, in consequence of the interest she felt in his history, I confess that my own feelings with regard to him were by no means softened. His agreeableness and conversational powers were undeniable; but the offensiveness of his opinions seemed rather to increase than to diminish, while his total indifference to Edith's charms absolutely annoyed me. He still maintained that tone of banter which rendered it difficult to separate jest from earnest in what he said, and well nigh impossible to discover how far the sentiments which he expressed were genuine, and how far they were merely assumed for the sake of drawing out his fair antagonist, whose enthusiasm seemed to increase in proportion to his levity, as though she were seriously bent on converting him to happier views. My dislike to him I think he perceived, but treated it with that contemptuous indifference which seems natural to the heart of man when the phenomenon ye call old maid is under consideration. With Lord Vaughan, on the other hand, I was every day more pleased; I say "every day," for he was literally a daily visitor. A message from his mother, a book to borrow or lend, a song to introduce and sentimentalize over (for he had all that shallow gentleman-like enthusiasm about music which consists in an uncritical admiration of a pretty song from the lips of a pretty girl); some pretext or other was sure to bring him up the garden-sweep, a little before the witching hour of luncheon; and then it was not his fault if arrangements were not made which ensured that the rest of the morning, if not the whole of the day, should be passed in the society of the beautiful heiress. All that I saw of him I liked. He was unaffected, lively, and good-humoured; and, if not very refined in his tastes or intellectual in his pursuits, I was disposed to think that a sensible wife might make just what she pleased of him. That Edith was his superior in mental power there could be little doubt; but I persuaded myself that this was of no consequence—forgetting, or overlooking, the fact, that he was destitute of that ascendancy of character which alone can compensate for the want of intellectual superiority; and that an union in which the wife moulds the husband, and not the husband the wife, is one with which love, properly so called, can have nothing whatever to do.

THE ORPHANS OF ST. GRATIEN;

OR,

FANCHETTE BRULARD.

CHAPTER III.

"FANCHETTE, a beautiful carriage is passing by; do come and look at it!" cried Lazette to her sister, who was busy hanging linen in the little garret of the house.

"I suppose it is to ask their way," replied Fanchette, without stirring. "Call Pierre, and tell him to show it."

"Pierre is at the door," said Lazette. "The carriage is stopping. . . . A gentleman is putting his head out of the window and speaking to Pierre. . . . He is getting out. . . . Our good Curé is with him,—he is getting out too; . . . and the Doctor also;—they are all coming this way. Come down, Fanchette; come down. I am sure they have some work for us."

Hardly were the words uttered, when the three gentlemen were ushered by Pierre into the cabin.

"Good morning, Lazette," said the Curé. "Where is your sister, my child?"

"She is coming down, sir," replied Lazette, accompanying her speech with a little curtsy. "Will you be so kind as to sit down, gentlemen, till she comes!" And the young girl presented them with wooden chairs, whose snowy whiteness showed that no pains had been spared in scouring them.

The Doctor and the Curé seated themselves; the other gentleman, who was a stranger to Lazette, remained standing, attentively examining the room; but it was evident that it was not mere curiosity that impelled him to this inspection, for his gaze seemed to speak of gratified sensibility.

"Is it not just as we told you?" said the Curé and the Doctor to him.

At this moment Fanchette appeared, tall and robust, her face beaming with health, and that look of perfect contentment which is produced by a good conscience. She advanced civilly towards the three visitors, and inquired what she could do for them.

"We only want you to come with us, Mademoiselle," replied the stranger.

"May I venture to ask whither, Sir?" replied Fanchette, in astonishment.

"Do not trouble yourself about that, my child," said the Doctor, speaking to her with all the familiarity of one who had known her from her cradle.—"But go and dress yourself; and you, too, Lazette. . . . and you, also, Pierre; put on all your best; for we will take you to Paris."

"To Paris!" repeated Lazette and Pierre, looking at their sister.

"As your honour wishes, we have only to obey," replied Fanchette: then, making a sign to the children, they all three disappeared up the ladder which led to the garret; and before long came down again, having completed their simple toilette. A calico gown, coarse, but neatly made, a silk apron, a little white bonnet, comfortable shoes and stockings, and a new neckerchief; such was the dress of the two girls. Pierre looked quite proud of his Sunday coat of blue cloth, and his thick plaid trousers.

"Let us set off," said the stranger. And the coachman having opened the carriage door, he presented his hand to Fanchette, to hand her in.

Fanchette became as red as fire; but the Doctor having said—"Go on, my child," she sprang up the steps, and seated herself bolt-upright on the first seat. Lazette and her brother placed themselves near her. The three gentlemen sat opposite, and the carriage went off at full speed. The three orphans, who had

never before been in any kind of carriage, seemed at first terrified at the unusual motion; but the respect due to the Curé and his companions made them repress any expression of fear. Meanwhile the carriage rolled on rapidly.

The noise of the wheels upon the pavement of St. Gratien drew all the inhabitants of the village to their doors.

"Stay; look at the Curé! where can he be going to?" demanded those who had as yet perceived only the pastor.—"And the Doctor is with him," cried another. And then an exclamation burst out, and flew, if we may so speak, from mouth to mouth,—*"Fanchette in a carriage, and Lazette, and Pierre!"* What can all this be about?" Many a greeting did she get by the way, but the young girl did not return them; not from any feeling of pride at thus being in a fine equipage, drawn by young prancing horses, and in the company of the Curé, the Doctor, and a fine gentleman who had a red ribbon in his button-hole; on the contrary, she was ashamed of this pomp,—she, a poor country girl, sewing from morning till night. She cast down her eyes, and did not venture to look at her respected conductors; so confused was she by this mark of their favour, that she could not enjoy it.

On went the carriage, passed through St. Denis, then through a part of Paris, then the Pont-Neuf, and then along the quays, till at last it stopped before a handsome monument situated in front of the Pont-des-Arts.

The three gentlemen alighted; Fanchette, with her brother and sister, followed; and all six entered the interior of the building. It was a circular apartment, with three doors opening upon as many galleries. Opposite them was a balustrade in the form of a crescent, in which were placed three arm-chairs, with a desk in front of each.

The Doctor and the Curé introduced the three orphans into this apartment, and placed them on a bench at the right-hand side of the crescent;—then, two doors opened, and gentlemen dressed in green embroidered with silver, took their places, some on the right, some on the left and the front of this crescent.

When Fanchette ventured to raise her eyes, she was not a little astonished to see before her, in the President's chair, the gentleman who had come for her to the cottage.

Then the meeting began. The President rose and related the history of Fanchette. When she heard her name pronounced in that assembly, followed by praises of conduct, which, up to that time, the simple country girl had considered only natural, she fancied herself in a dream; but, when the President concluded his speech, by saying, that the prize of ten thousand francs, founded by the late Baron Monthyon in favour of any of the French poor who should perform any extraordinary act of virtue, was adjudged to Fanchette Brulard, and when she discerned, as well as eyes dimmed with tears would allow, the venerable Pastor of St. Gratien take a crown from the hands of the President, and come to present it to her—to her very self!—she at length understood that she was the object of all that had been said; she rose, she tried to speak; but this public homage was too unexpected, too overwhelming for the artless simplicity of the young girl. She could not restrain her emotion, and fainted away. She was carried into an apartment of the Institution, and thus escaped the acclamations which this simple and touching accident had called forth. She recovered to find her brother and sister weeping over her with grateful affection.

That same year, the State gave a dowry to Fanchette, who was married to a respectable tradesman, with whom she enjoys all the happiness she deserves. She is now a mother, and as good a mother as she was a daughter and a sister. Lazette has determined never to leave her.

As to Pierre, bound to a trade very young, he is now

out of his time, and in a fair way to a comfortable independence.

What were now all Fanchette's past trials,—the long days of labour, so hard to the desolate young orphan,—but so many causes of daily thanksgiving to that God who had inspired her with such disinterested fortitude! Thus these three beings, who seemed to have been condemned to destitution and misery, are all made happy through the self-devotedness of one of them, and a striking example is afforded of what may be effected by the love of God, by true affection, and persevering industry.

It may not be uninteresting to mention some of the cases to which have been awarded the prizes for Virtue founded by the philanthropic Monthyon. They are distributed annually; and the record proves what a spirit of love is exercised by the poorer classes. A regular list, even of the most remarkable, would be endless. A few are given without any attempt at selection:—

Julie Bagot, with an income only of seven hundred livres, founds an asylum for poor orphans. She teaches them to read, to write, and to sew, and brings them up in the fear of God.

Marie Robert continues, during forty-two years, to serve her employers, who had met with reverse of fortune and fallen into indigence, and who could not give her a penny wages. She refuses ever to abandon them, and even maintains them by her labour.

Catherine-Félicité Gusgy, to whose care had been committed an orphan, the infant son of a friend, as poor as herself, who died in child-birth. Catherine put the child to nurse, and afterwards brought him up as her own son, though it was a heavy burden upon a family, the head of which was a poor tailor, and the wife endeavouring to earn something by embroidery. They gave him some education; and, not succeeding in making him a musician, they placed him with an engineer, paying for him rather a high apprentice fee. He became expert at his work, and ceased to be a burden on those whom he believed to be his parents; and, in his turn, helped them when illness had rendered Catherine's husband unable to work.

It was then he learned that he was not their son, which caused him as much grief as astonishment. In order to spare these two excellent people even the shadow of humiliation, which every noble mind must feel, at receiving aid from a stranger, he obliged them to adopt him as their son by a legal act. Others take out patents to secure a right to an inheritance; he did it in order to acquire the right of assisting his benefactors, fallen into poverty, without wounding their delicacy.

The following account has been related by a Curé of Paris to the Committee entrusted with awarding the Monthyon prizes:—

"The wife of Jacques, a water carrier, who is the father of three children, one of whom is dumb and sickly, and who earns at the utmost thirty-five or forty sous a-day, came to me the other day to ask help for a poor infirm woman, named Pétrelle, who had lost two fingers, and was unable to earn her bread.

"Where does she live?" I inquired.

"With us."

"For how long?"

"Indeed, now nearly eleven months."

"How much does she pay you a-day?"

"Oh, sir! how could she pay me anything?"

"What, nothing?"

"Not so much as a glass of water."

"Does she receive anything from the parish?"

"Yes, sir; and I also. I receive bread for my children. Since she came to us, I make the soup go as far as I can, and she takes her share."

"But you are not in a situation to make such a sacrifice: surely she has promised to pay you some time or other!"

"She has never promised me anything but her prayers."

"And does your husband make no objection?"

"My husband never says anything; he is too kind-hearted for that."

"He is not a customer at the public-house?"

"Oh, no! indeed, never. He works for his children till he is half dead."

"And you actually have had this woman for nearly eleven months?"

"What could we do? We found her in the street! She asked us to take her in for a couple of days. Would you have had me or Jacques have had the heart to shut the door in her face? And, besides, you know we ought to do to others as we would they should do unto us."

"But, my good woman, how many rooms have you?"

"Two."

"What rent do you pay?"

"A hundred and twenty francs. Our rent has been raised twenty francs; that comes to eight sous a-day."

"Why, even you yourself are in want of charity?"

"As I told you, sir, I receive bread from the parish for my children. Thanks be to God! I ask nothing for myself,—so long as my husband and I can work, I should be ashamed to trouble any one."

"Well, my good woman, take these two crowns...."

"Poor Pétrole! How glad she will be!"

"And her eyes filled with tears of joy. It was for herself I had intended the money, but I let her remain in an error, which did her so much honour."

A CHRISTMAS PARTY IN THE COUNTRY.

CHAP. IX.

"Upon my word, Lucy," exclaimed Alleyn, when his sister had concluded her rhapsody—"Upon my word you have strange ideas of proportion! Doubtless your friends the fairies are very clever people, and can do wonders; yet I appeal to everybody if it be possible to creep into a thimble. Your own thimble! Just make the attempt! If you will be poetical, pray try if you cannot be a little sensible also."

All laughed at Alleyn's indignation, and even Lucy allowed she had been talking something like nonsense; but contended that "fairy thimbles" was a very pretty name.

"And it is borne out by the botanical name, *digitalis*, Lucy," said Cyril; "which Alleyn himself must allow to be Latin for a thimble."

"If you talk of classical names," said Alleyn, "I must ask if *Cypripedium* does not come from Cypria, a name of Venus; and if the lady's slipper may not be supposed to be consecrated to Venus as well as to the Virgin Mary?"

"Your derivation is correct, I believe," returned Rosaline, "and poor Mr. Selby made sore complaint, (though I know not with what justice,) that modern botanists had stolen many plants from their more holy associations to give them to the pagan deities, or at least to obliterate any trace of the obligation which medical botany is under to the monks of old, by changing their names; adducing as instances, besides this very plant, the maiden or Venus' hair, which was formerly our Lady's hair; *flor Jovis*, formerly God's flower; iris, formerly the flower of St. Louis, or *Fleur de Lys*; the daisy, formerly dedicated to St. Margaret, and still called *La Belle Marguerite* by our continental neighbours; the goats-head, which was formerly the Star of Jerusalem; the crocodil or Lent lily, and the pansy or *viola tricolor*, which used to be called herb Trinity. He even included the rosemary in his religiously named plants, as Mr. Barlow would have done, but we stood out for the other, and I believe the proper derivation of this name."

"Marygold and Costmary, however," added Lucy, "we were obliged to yield to him; and they, like the Star of Bethlehem and others, still retain their old appellations."

"A little reflection," said Sophia, "will help us to several others. Canterbury bells, for instance, so named in honour of St. Augustine, who preached Christianity to our Saxon forefathers in that city, near which the flowers abound; hollyoak, which is a corruption of holy oak; our Lady's smock, or cuckoo flower—*cardamine pratensis*—which some say is so called because where this flower is plentiful, it spreads white over the meadows like linen lying to be bleached; whilst others derive the name from its appearing about the feast of the Annunciation or Lady-day; the *polygala vulgaris*, or milkwort, has been called cross-flower—not because it is cruciform, for in fact it is a papilionaceous flower—but because it blooms about the third of May, the feast of the Invention (or finding) of the Cross; and my often-quoted friend Gerarde says it may be called Rogation flower, "because the maidens who do walk in procession in Rogation week do use it in their garlands."

"Then," continued Lucy, "we have the *Hypericum*, or St. John's-wort, which flowers about the twenty-fourth of June, the feast of St. John the Baptist; and the Basil, so named in honour of St. Basil; the herb St. Robert; and the herb St. Bennet."

"You must not pass over the St. John's-wort so hastily, if you please," interrupted Charles, "since you well know it is still held to be a most wonderful and mystic plant by all the lads and lasses in this neighbourhood. If Justine stay with us until midsummer she may have her fortune told, and perform all requisite incantations on Midsummer's Eve."

"Indeed," exclaimed Justine, "I will do no such thing, for I should be frightened to death if I did. Natalie de Bignon, Susette Marigny, her brother Paul, and I, once agreed to go to a fashionable conjuror in Paris, but my courage failed before we set out, and though they laughed at me, and teased me, and coaxed me, I let them go alone—and they came back dreadfully alarmed—Natalie, and Susette, I mean. I never shall forget how pale Susette looked! He had told her she was to suffer much distress from '*une demoiselle de mauvaie mine, bien mise en robe bleu*,' and I can assure you she turned pale at the sight of every blue dress she saw for a month afterwards. She actually quarrelled with me for wearing '*une robe céleste*—and I am sure I do not think I am '*une demoiselle de mauvaie mine*—am I?"

"No, no, ma belle cousine," replied Charles to this inquiry, "we must all deny such a charge against you, though I must say you did not show yourself '*une demoiselle bien courageuse*.'"

"Oh, I am sure I should have been frightened to death, for every body was frightened at him, and he was quite the rage. They said he was as wonderful as the famous Mademoiselle le Normand. Natalie could not sleep for a week afterwards, and her mamma was very angry. I was so glad I did not go!"

"I fancy, Justine," said Mrs. Lorraine, "that part of your rejoicing would be from a feeling that the expedition was not a very proper one, and I do not wonder at Madame de Bignon being angry with the party who went. Our country mysteries, though equally foolish, are divested of impropriety, and it is a curious circumstance that St. John's Eve, seems to be selected for superstitious purposes in various countries, and the St. John's-wort held as a 'plant of power' wherever it grows."

"There are many particulars of midsummer customs in '*The Every Day Book*,' especially that of lighting bonfires on St. John's Eve, still kept up in Ireland, and supposed to be derived from the worshippers of Baal," said Mr. Lorraine, "and there are likewise quoted both Spanish and German poetical traces of the veneration in which the day and the St. John's-wort are

held in Spain and Germany. The burden of the Spanish ballad which has been sung for centuries on the banks of the Guadalquivir, is

'Come forth, come forth, my maidens, 'tis the day of good St. John,
It is the Baptist's morning that breaks the hills upon;
And let us all go forth together, while the blessed day is new,
To dress with flowers the snow-white wether, ere the sun has dried the dew.'

"But Justine must learn the German rite," cried Charles, "it is a pity we have not it in the original grandly-rumbling words, but she must try what the translation will do—"

'Thou silver glow-worm, O lend me thy light,
I must gather the mystic St. John's-wort to night,
The wonderful herb, whose leaf will decide
If the coming year shall make me a bride.'

"I think," said aunt Martha, "we should all be more pleased with Mrs. Howitt's lines, entitled 'Holy Flowers,' which certainly speak my feelings on the subject we have been discussing, and which are the more valuable as a testimony in favour of those beautiful old names and sacred associations, because they come from one of a sect who regard all outward tokens of reverence for holy things as superstitious. She begins by lamenting—"

'Woe's me—how knowledge makes forlorn;
The forest and the field are shorn
Of their old growth, the holy flowers—
Of if they spring, they are not ours.'

And then, after describing the peasant of old meeting them in his daily toil, goes on to say—

'Then musing in the woodland nook,
Each flower was as a written book,
Recalling by memorial quaint,
The holy deed of martyred saint;
The patient faith, which, unsubdued,
Grew mightier through fire and blood.
One blossom, 'mid its leafy shade
The virgin's purity portrayed;
And one, with cup all crimson dyed,
Spoke of a Saviour crucified;
And rich the store of holy thought
That little forest-flower brought;
Doctrine and miracle, white'er
We draw from books was treasured there.'

And after some beautiful description, too long for me to quote, concludes by asking—

'What though in our pride's selfish mood,
We hold those times as dark and rude?
Yet give we, from our wealth of mind,
Feeling more grateful or refused?
And yield we unto nature aught
Of loftier, or of holier thought,
Than they, who gave sublimest power
To the small spring and simple flower?'

"It certainly was a very ingenious method of impressing knowledge upon the minds of the unlettered peasantry; but are all these holy flowers natives of Great Britain, Sophia?" asked Mrs. Barlow.

"Certainly not all, nor even all that are commonly esteemed such, many of which are only naturalized, and usually found in those vicinities where trace or tradition of some abbey, cell, or other monastic institution yet lingers. The monk's hood, for instance, appears like a cowed ghost in the scenes where it was honoured; and one writer has even declared that the snowdrop loves such sacred haunts, and in support of his theory of its foreign origin, says that it is never named by Chaucer, though he has celebrated the daisy and many other of the really indigenous flowers."

"How strange that they should have remained so long attached to one spot! I should have thought

that they would have died away in the course of time," remarked Justine.

"The perpetual reproduction of plants," said Mr. Barlow, "provides for their continuance, and it is not so much the ghost of the monk's hood as one of the descendants of the original stock which we meet with in these old stations; besides which, nothing is more wonderful than the vitality of seeds. They may be hidden in the ground for years—nay, for ages, undestroyed, and at length, when brought by accident near the surface, or otherwise into a favourable situation for development, spring to life, surprising all around as a new and apparently unaccountable production. Soil which is raised by boring for water at the depth of many yards, will produce vegetation when exposed to the influence of the atmosphere; and after ploughing up moor lands or very old sward, many plants will appear which have not grown there before, and even sometimes such as are unknown in the neighbourhood. Near my own residence, for instance, in one locality, every piece of old sward which is broken up yields for the first year an abundant crop of that useless weed, the yellow rattle, which disappears in a few seasons."

"I think Jesse, in his 'Gleanings on Natural History,' mentions a curious fact in corroboration of what you say of the vitality of seeds," said Mr. Loraine; "which is, that near an old castle at Moffat, formerly belonging to the Regent Murray, whenever the peat, which is some inches deep, is removed, there spring up various flowers from the exposed soil, many of which are to this day rare in Scotland, and that the spot where they appear is supposed to have been the site of the ancient garden."

"I cannot at this moment remember in what book," said Sophia; "I once read an account of some English voyagers on the coast of America discovering where a settlement had formerly been attempted, by finding in a sheltered spot roses and other European flowers still flourishing, though all other trace of civilization had abandoned the place. It reminded me of what Campbell says—"

'One rose of the wilderness left on its stalk
To mark where a garden had been'—"

"And Mrs. Hemans," interrupted Rosaline, "what a beautiful passage she has to the same effect—"

'Yet rich knots
Of garden flowers, far wandering and self-sown
Through all the sunny hollow, spread around
A flush of youth and joy, free nature's joy,
Undimmed by human change. How kindly here
With the low thyme and daisies they have blent!
And, under arches of wild eglantine
Drooping from this tall elm, how strangely seems
The frail gum-cistus o'er the turf to snow,
Its pearly flower-leaves down!'

"How little did the founders of our beautiful monasteries ever think that the perishable flowers would be, in many cases, their sole memorial," said Aunt Martha; "and would flourish in beauty when the stately structures they were brought from other lands to adorn, had fallen beneath the hand of time, or of destruction."

"I do believe," exclaimed Justine, "that there were some raspberry plants exhibited at the Chiswick fête, which had sprung from seeds discovered in some old tomb, and were supposed to have remained buried there many hundred years. I am sure somebody bid me remark them as a great curiosity."

"They were so, indeed," replied Mr. Loraine; "and, if I remember the circumstance rightly, those seeds were taken from a body found in an ancient British tumulus near Dorchester, thirty feet beneath the surface, and which, from the coins of the Emperor Adrian which accompanied it, was supposed to have reposed there for sixteen hundred years. But sixteen

hundred years is a mere trifle, if we consider the fact of an onion germinating, which was found in the hand of a mummy, and was probably from two to three thousand years old."

"One of the most extraordinary instances of the vitality of seeds that I remember to have heard of," said Cyril, "is that of the grains of corn discovered a few years ago, when an Egyptian mummy was unrolled, enclosed with the body. Four of these grains were presented to the Countess of Haddington; and, on being sown in a favourable spot of the garden belonging to the Earl's seat in East Lothian, sprang up, flourished, and yielded an abundant harvest. With what awe and reverence may we not regard this strange revival! and how strongly does it seem to point that noble passage of St. Paul's Epistle to the Corinthians, in which he bids us look upon the grain which is sown, as the type of our own more glorious resurrection! But the whole history of corn is a mystery. Is it not curious, that no species of corn, such as serves for food to the greater part of mankind, is ever known to grow spontaneously? yet you see the seeds of wheat possess the same vitality as other seeds? The mysterious origin of corn; the fact that it has never been found wild with the same properties which render it good for food, but degenerates, and becomes useless without constant cultivation; and the tradition of all nations, that it has been a gift from their gods, may teach us to look to the Giver of all good things, who sent forth Adam from paradise to till the ground, and made labour, in some way, the lot of all mankind, that industry might turn their punishment into a blessing."

"You have, indeed, Cyril, touched upon one of the most wonderful facts connected with botanical research," continued his father; "one of those which strikingly lead us back to revelation, where, in the earliest record of the sacred volume, we are told that labour is to be the portion of all the descendants of fallen Adam, and that the ground has been cursed for his sake. When we look round upon the earth clad in the lovely garb of summer, rich in all that delights the eye and captivates the taste, we may be tempted to forget this awful truth; but, when we find that the produce most necessary to us requires constant culture, and that, without the sweat of man's brow unceasingly applied to it, it degenerates, and shortly disappears; then, indeed, we must acknowledge His Almighty hand, who has not left us without witness in the course of His providence; and for these indications of His wonderful power we must bless Him as well as for the stupendous mercies of our redemption. Such praises are the title of mint and cummin which must not be omitted, though He has still stronger claims upon our gratitude and love."

"Your remarks," said Mrs. Martha, "are quite in unison with some which I found, this morning, in this new book, 'Nichol's Help to Reading the Bible,' and so very applicable to one passage which struck me greatly, that I must quote it.—Here, luckily, I have found it without difficulty.—After referring to various parts of Scripture connected with natural history, he concludes the chapter by saying, 'The figurative use which the Scriptures thus make of the works of nature, should lead us to view them in the same association. What Paley says of that train of thinking which constantly refers the phenomena of nature to a supreme intelligent Author, applies with more force to that train of thinking, by which, from the works of nature we are reminded of some great revealed truth. To have made this the ruling, the habitual sentiment of our minds, is to have laid the foundation of everything religious in our mind. The world, thenceforth, becomes a temple, and life itself one continued act of adoration.'"

"It is quite true," remarked Mr. Barlow, "that no one branch of knowledge can be isolated and studied alone. There is a unison and harmony throughout the works both of nature and of moral providence, which leads from one to another, and makes each

reflect upon each. Even our evening conversations upon flowers cannot be carried on without perpetual digressions, and the examination of a weed may carry us into the regions of mechanism, chemistry, poetry, or history."

"History?"

"Yes, history," said Mrs. Loraine; "and, as a proof, here is a floral charade into which Mr. Hamilton has contrived to bring points of English history, which will, I think, help you all to guess it."

"Oh! mamma," exclaimed Agnes, "do tell me how many charades you have left: I do so long to know how many, that I may be able to hope, at least, that James will be here before my birthday."

"I had a peep at the stock this morning, Agnes," said Charles, "and can tell you, for your comfort, it is very low; besides, I stole one, if you think lessening their number will hasten the time of his arrival."

"Stole one! Oh, Charles! what did you do that for?"

"I stole one for the purpose of presenting it to Justine; but I do not intend to give it to her to-night, though I see she is dying with curiosity to hear it. No, no, Justine; you must be contented with my mother's selection, until a proper opportunity occurs of making you the receiver of stolen goods; so listen attentively, if you please, whilst I read this. Hem! hem!—

Long years have fled, and carried in their train
The conqueror and conquered, since my *First*
Gleamed as a standard on the battle-plain,
And o'er this island as a war-cry burst;
When the young hearts that at one knee were nursed,
And in one garland had its fair buds twined,
Severed by faction's deadly rage accursed,
Where the full flower was waving on the wind,
Rushed madly each on each, by party hatred blind.

But civil discord ceased—rejoicing came
Peace, to unite in one each rival race,
And bear it onward, till my *Second's* name
A queen enthroned bore—and who may trace
The working of her mind?—In that high place
She ruled with bigot zeal—her heart sincere,
But all untempered by love's gentle grace;
Doomed to the flames martyrs we still revere:
And bade our meek religion sway the world by fear.

She ruled, but God o'erruled—for light appeared
And spread its genial influence o'er the isle,
Where many a moss-grown tower and spire upreared,
Glowed with an added beauty 'neath its smile.
Low grassy hillocks lie around each pile,
Where rest in hope those who have bent the knee,
And bowed the heart within the solemn aisle:
Planted with dutiful hands, there oft we see
My *Whole* bloom o'er the grave, type of fond memory."

Grisildis, the Peasant-Wife.

"Among this pover folk ther dwelt a man,
Which that was holden pourest of them all;
But highe God sometime senden can
His grace unto a lital oxes stall:
Janicola men of that thorpe him call.
A doughter had he, faire ynough to sight,
And Grisildis this yonge maiden bight.

But for to speke of vertuous beautee,
Than was she on the fairest under sonne:
Ful pourely yfostred up was she:
No likerous lust was in hire herte yronne:
Wel after of the well thanke of the tonne
She dranke, and for she wolde vertue please,
She knew wel labour, but now idel ese.

Upon Grisildis, this poure creature,
Ful often sithe this Markis sette his eye,
As he on hunting rode paraventure:
And whan it fell that he might hire espie,
He not with wanton loking of folie

His eyen cast on hire, but in sad wise
Upon hire chere he wold him oft avise,
Commending in his herte hire womanhode;
And eke hire vertue, passing any wight
Of so yong age, as wel in chere as dede.
For though the people have no gret inaight
In vertue, he considered ful right
Hire bountee, and disposed that he wold
Wedde hire only, if ever he wedden shold.

This thoughtful Markis spake unto this maid
Ful soberly, and said in this manere:
Wher is your fader, Grisildis? he said.
And she with reverence in humble chere
Answered, lord, he is al redy here.
And in she goth withouten lenger lette,
And to the Markis she hire fader sette.

He by the hond than toke this poure man,
And saide thus, whan he him had saide:
Janicola, I neither may ne can

Lenger the plesance of min herte hide,
If that thou vouchesauf, what so betide,
Thy doughter wol I take or that I wend
As for my wif, unto hire lives end.

Thou lovest me, that wot I wel certain,
And art my faithful liegeman ybore,
And all that liketh me, I dare wel sain
It liketh thee, and specially therfore
Tell me that point, that I have said before,
If that thou wolt unto this purpos drawe,
To taken me as for thy son in lawe.

This soden cas this man astoned so,
That red he wer, abaist, and al quaking
He stood, unnethes said he wordes mo,
But only thus; Lord, quod he, my willing
Is as ye wol, ne ageins your liking

I wol no thing, min owen lord so dere,
Right as you list, governeth this matere.

Wondring upon this thing, quaking for drede,
She saide; Lord, indigne and unworthy
Am I, to thilke honour, that ye me bede,
But as ye wol yourself, right so wol I:
And here I swere, that never willingly
In werk, ne thought, I nill you disobeie
For to be ded, though me were loth to deie.

This is ynough, Grisilde min, quod he.
And forth he goth with a ful sobre chere,
Out at the dore, and after than came she,
And to the people he said in this manere:
This is my wif, quod he, that stondeth here.
Honoureth her, and loveth hire, I pray,
Who so me loveth; ther n' is no more to say."

From Chaucer's "Clerk's Tale."

ON THE USE OF ETHER IN SURGICAL OPERATIONS.

EVERY one is more or less interested in the progress of medical science,—in the means employed to prevent or remove disease or to mitigate pain; but it seldom happens that an invention or discovery in medical science is so simple in its nature, and so perfect and extensive in its application, as to address itself at once to the popular mind, and be at the same time welcomed by the whole of the medical world.

Such however has been the case with the recent discovery of the effects of the vapour of ether in rendering a patient insensible to pain. A surgical operation is at all times regarded with horror, and many a poor sufferer has preferred to linger on for years under a painful disease rather than encounter the knife of the operator; and many a one has been sacrificed to the terror, the pain, and the exhaustion of an amputation, when that was the only chance left for the preservation of life.

Happily the days of painful operations will henceforth to a great extent belong only to the past. The discovery that the inhalation of the vapour of ether renders the patient insensible to pain, is one of the many boons which science has conferred on humanity, and seems worthy of particular notice in a journal which has hitherto succeeded so well in mingling the *utile* with the *dulce*.

The inhalation of gases in the treatment of disease is not new to the medical profession. Sir Humphry Davy began his career at the Pneumatic Institution at Bristol, established by Dr. Beddoes for the purpose of investigating the medical powers of various airs or gases. We are not aware that any useful results were produced. It is true that Davy discovered the singular property of the protoxide of nitrogen, (a compound previously discovered by Priestley,) of exciting pleasurable sensations, and causing the persons inhaling it to exert powerful muscular action; but, except as a curiosity, the laughing gas has excited little notice except on the part of the scientific chemist.

The honour of the discovery of the valuable property of ether above alluded to, is due to Doctors Morton and Jackson, of Boston, in the United States; and, if we mistake not, it was first used in this country by Mr. Liston. Under the influence of this new agent teeth have been extracted, limbs amputated, and the most tedious and dangerous operations performed. Mr. Lawrence gives an account of one which he describes as being among the most painful of surgical operations—namely, the extirpation of the eye ball for the cure of malignant disease. This was performed with so little pain, that the patient, after recovering from the effects of the ether, did not even know that the operation had commenced. This is a very common result in the cases which have hitherto been reported; and an amusing

illustration of it is recorded by the *Edinburgh Witness*. The operation was performed by Professor Miller, at the Royal Infirmary, upon an Irish "navigator" who had sustained a compound fracture of the leg nine weeks before. The fracture had not united in consequence of the presence of a piece of dead bone; and it became necessary to remove this by a painful operation. The man appeared to resist the influence of the vapour. He said he was not asleep, and declared that "it wouldn't do." The operation was at length begun; the patient remained unconscious, repeating that "it wouldn't do." At the end of ten minutes the operation was finished, and the operator remarked to the man, "Well, I suppose you won't let me operate to day?" "Certainly not," said the patient; "*it won't do*: I must be asleep. We can try it another time." On sitting up and seeing the wound, he burst into an immoderate fit of laughter, saying, "No doubt there's blood, or something very like it; but I haven't felt a single thing done to my leg. That *bates* the globe." And on being asked decidedly as to his having "felt anything," he repeatedly answered, "Not a ha'porth." He got into amazing spirits, and refused to leave the table until he had been told "all about the toldrums of the business."

The action of the vapour of ether seems to be upon the nerves of sensation, producing paralysis and consequently insensibility to pain, but not necessarily a loss of consciousness. Several cases have been reported in which the patients, although deprived of all power of feeling and of moving, have been conscious all the time, and have watched every step of the operation performed upon them, but without any sensation of pain. One case afforded a ludicrous illustration of this: the patient during the operation "giving sly winks and facetious nods to those surrounding him. During the intervals of the inhalation his observations were of the most facetious character—forcing from the bystanders involuntary laughter, and converting that which was to the poor fellow a most tragic event into a scene little short of a farce." In other cases, consciousness is less evident. One person during the extraction of a tooth fancied he was contending with a wild beast, which he seemed to have overcome when the tooth was out. A female during the amputation of her leg thought she had been in a dream, and that the operator had hurt her leg to see if she could bear the operation next day. A lady from whose neck a large tumour was removed, was conscious of the fall of something into a basin, (which in fact was the tumour itself,) but knew nothing of the operation until it was all over.

The effect of the vapour of ether upon the system is similar to that of a large quantity of alcohol taken into the stomach. Indeed, Mr. Lawrence relates a case in which he removed the leg of a woman who was intoxicated, and who knew nothing of the matter until she became sober. But the insensibility produced by alcohol

taken into the stomach is preceded by nervous and vascular excitement, which in many diseases would not only be objectionable, but even fatal to the patient. We are by no means sure, however, that the vapour of alcohol, if inhaled, would not be as efficacious as that of ether in making a person "dead drunk," and leaving him with as little ill effect. The chemical characters of alcohol and ether are in many respects sufficiently distinct, but they have also many points of resemblance, and are, in fact, members of a highly interesting group which has for its base a substance called *Ethyle*, which has never yet been obtained in a separate form, but which is known to consist of four atoms of carbon, and five atoms of hydrogen. By the addition of one atom of oxygen we get oxide of ethyle, or common ether, also called sulphuric ether, because it is obtained by the action of sulphuric acid upon alcohol, but improperly so, since no sulphur enters into the composition of ether. By combining *chemically* an atom of water with ether, we get alcohol, which in chemical language is the hydrate of the oxide of ethyle. The ether compounds form a numerous family, but only two or three of them are used in medicine; one is the common ether already mentioned; a second is chloric ether, consisting of an atom of chlorine united to ethyle, and called chloride of ethyle; a third is nitric ether, formed by the union of nitric acid with the oxide of ethyle.

The physical properties of common ether are as follows:—It is a colourless, transparent, fragrant, thin, mobile liquid; it boils at 96° (while water boils at 212°); it passes off rapidly in the form of vapour, and, although so volatile, its vapour is more than two and a half times heavier than its own bulk of air, and can, in fact, be poured from one glass into another, like water. Mingled with oxygen gas, this vapour explodes violently on the application of flame or the electric spark. Ether is very combustible, and burns with a white flame. It freezes at low temperatures, and it mixes freely with alcohol, but not with water.

Alcohol is also a colourless, transparent, limpid liquid. It has a fragrant agreeable taste and odour; it boils at 178°; it is not so volatile as ether, but its vapour is heavier than the air; it is very inflammable, and burns with a pale bluish flame. Alcohol has never been frozen by any degree of cold yet produced. It absorbs moisture from the air, and mixes with water in all proportions; if the mixture be made suddenly, a contraction and consequent rise in temperature takes place. Both ether and alcohol have solvent powers, but those of alcohol are greatest.

The explosive property of ether, when mingled with oxygen, either in the pure state, or with nitrogen, as it exists in the atmosphere, requires the exercise of caution in administering the vapour. The moment a bottle of ether is uncorked it discharges torrents of invisible vapour, which pour down to the floor, mingling with the atmosphere of the apartment, and are in danger of being exploded by the flame of a lamp or candle. If an explosion should unhappily reach the air which the patient is inhaling, the consequences might be awful; communicating with the air in the interior of his chest, some of the most essential organs of life would be torn and destroyed, and a painful death terminate a humane experiment to prolong life.

Thus it will be seen how very important it is to confine the use of this important remedial agent to the hands of well qualified professional men; not only on account of the danger of an explosion, but from the state of the patient intended to be operated on. Where there is a tendency to apoplexy or disease of the heart, the use of the ethereal vapour might be highly objectionable, and it is for the medical man alone to decide upon such cases of exclusion. Again, we are strongly impressed with the idea, that in numerous cases the vapour of ether may be used simply as an anodyne, as a soother of pain, without any reference to an operation, but to take the place of narcotics, and give rest and refreshment with-

out the objectionable results produced by the frequent use of narcotics. There are other cases in which the use of ether may be of immense benefit, which cannot be mentioned in this journal; but in them, as in all other cases where it is administered, competent medical advice must first be sought, and no attempts made to inhale it without proper medical superintendence.

Now, as to the method of administering the vapour, we will first quote the remarks of Mr. William Herepath, of Bristol, on a case witnessed by him of the amputation of the leg of a young man. He says:—"No complicated apparatus is necessary, nor any extraordinary care in purifying the ether. A common, but very large, bladder should be fitted with a collar, to which an ivory mouth-piece with a large bore can be screwed without the intervention of any stop-cock; pour in about an ounce of good common ether, and blow up the bladder with the mouth till it is nearly full; place the thumb on the mouth-piece, and agitate the bladder so as to saturate the air in it with the vapour; as soon as the patient is ready for the operation, close his nostrils, introduce the mouth-piece, and close the lips round it with the fingers. He must now breathe into and out of the bladder; and in about one or two minutes the muscles of his lips will lose their hold. This is the moment for the first cut to be made. In two or three minutes the effect will begin to disappear; the mouth-piece should be again introduced, and this repeated as often as required. If the pulse should indicate a sinking of the patient, a little wine will restore him. * * *

The administrator of the vapour will of course take great care that no fluid ether shall be allowed to be drawn into the lungs; otherwise suffocation would result, or at the best a violent cough, which must protract the operation and considerably distress the patient."

The apparatus described by Mr. Herepath is such as is commonly used for inhaling laughing gas: it has the merit of being simple, but there is little else to recommend it in administering the vapour of ether. It affords no method for regulating the supply of the vapour, because a volume of air saturated therewith at 40° would contain less than half the quantity of vapour in a similar volume of air at 70°. Many forms of apparatus have been already contrived, and, as we believe, patented; but one of the best which we have seen is that recently described by Dr. Snow, at the Westminster Medical Society. It consists of a round tin box, two inches deep, and four or five inches in diameter, with a tube of flexible white metal, half an inch in diameter, and about a foot and a half long, coiled round and soldered to it: this is for the purpose of admitting air into the box. There is also an opening in the top of the vessel, to which may be screwed a flexible tube connected with a mouth-piece. Within the box is a spiral plate of tinued iron soldered to the top, and nearly touching the bottom. The inhaler is put into a basin of water, mixed to a particular temperature, so as to supply the proportion of vapour intended to be given. When the patient begins to inhale, the air, in passing along the tube coiled round the box, acquires the proper temperature; it then enters the box, and passing over the surface of the ether, proceeds along the spiral channel, to the centre opening, whence it passes along the tube to the mouth of the patient. By this means the air is saturated with vapour, and maintained at the proper temperature. In this apparatus there is no valve or other obstruction to the air, until it has reached the mouth-piece, which is provided with valves to prevent the return of the expired air into the apparatus. At a temperature of 70° the ether effects were powerfully produced upon a patient in thirty seconds.

Several medical men have very properly tried the effects of the vapour upon themselves before administering it to their patients. The most lucid description of the effects of the inhalation, which we have seen, is that by Mr. Gerdy, in a communication made to the Academy of Sciences at Paris. He says: "The irri-

tation which I felt at first in the throat made me cough, but, being resolved to resist, I soon triumphed over this little obstacle; the irritation and cough gave way as the inhalation continued. I next experienced a numbness of the head, attended with heat, as if the vapour of alcoholic and intoxicating liquor was mounting to the brain. This numbness extended itself rapidly, first to the feet, and then to the legs and arms, and next to the loins, and increased rapidly with each inspiration. In the sensitive organs it was attended with an agreeable sensation of heat and of vibration similar to that which we experience in touching a vibrating body. When these two sensations reached their maximum, I experienced an impression, both agreeable and voluptuous, like that of intoxication. It is the numbness of which I speak that diminishes the pain in operations. My sight was not sensibly benumbed; the hearing was more so, and it became more and more feeble as the intoxication increased. I convinced myself, however, that the smell, the taste, and the touch, properly speaking, were not paralyzed by the general numbness which came over me; but my eyelids became heavy, and I felt a desire to give myself up to the charms of my intoxication."

In a few cases which have been reported the ether vapour has failed to produce the desired effect, and has only distressed the patient; but it must be remembered that in these cases the mode of administering the vapour was by very rude and imperfect apparatus; so that we have yet to see whether, in such cases, successful results may not ensue from the judicious administration of air of the proper temperature, saturated with the vapour, and given under circumstances in which the comfort and convenience of the patient are consulted. From the novelty of the plan, fear may in some cases prevent the vapour from acting properly: thus, from many causes, failures in administering the vapour, as well as exceptional cases where it would be wrong to attempt to administer it, will of course occur; but considering how trifling are such exceptions, as compared with the vast amount of unalloyed good that this discovery seems capable of producing, we are not disposed to think the praise excessive, which ranks this as the most important discovery which has been contributed to medicine since that of vaccination by Dr. Jenner.

THE MERCHANT.

CHAP. VIII.

THE merchant's first visit to the Grange was a very short one, but he promised that it should soon be repeated. His departure was followed by the arrival of a box of Indian treasures which he had promised to Mrs. Markham; but there were not, as there used to be, many things marked with Juliet's name, only a very beautiful and costly gold chain. An accompanying letter acquainted Mrs. Markham that Neville had chosen for Juliet a harp, and some drawings which her pencil might be worthily engaged in copying. Juliet saw that her father and mother were gratified. She sighed, and thought that Neville was very generous, more than she felt that he was very kind. She was averse to the occupation with which he had provided her; nevertheless, when once engaged, as she felt constrained to be, she derived a pleasure from them which won her from herself. She had never touched so fine an instrument before; never looked on any representations of nature so excellent as those which Neville had selected for her. She often thought of him, and went with pleasure to tell Hester that he was coming again, and for a much longer time than before. The old

woman rejoiced, and detained Juliet to tell her tales of the past. She ended:

"Ah, Miss Juliet! the tears stood in his eyes when he spoke to me of your likeness to her that is gone. And you look more like yourself, and more like her as he knew her, than you did when he came. Now you must do all you can to cheer him; indeed you must."

"Well, so we will, all of us, and Marion too, and it will do him good to hear her laugh."

"No, Miss Juliet, it will do him more good to see you smile."

Juliet thought of these words as she went away, and she felt touched by the tender consideration in which it was evident that Neville held her.

Neville came, and he was rejoiced to see that Juliet met him with a countenance more animated, and a step less listless. He also perceived that the gold chain which the box had contained hung round her neck.

"Let us take our friend to see Mr. Villiers and his sister, Juliet," said her father, the day after Neville's arrival.

"Oh, yes," replied Juliet with alacrity, "let us take him to Miss Villiers without delay. Indeed I promised to do so as soon as he returned. I have shown her all the beautiful drawings you have sent me, and have inspired her with a wish to make acquaintance with you."

"And Mr. Villiers?" said Neville.

"He is more silent, less clever than his sister; not less good. His countenance tells you how benevolent he is, but in society he speaks little on ordinary topics. I like better to meet him in a cottage or the school; his voice and his smile when he is with children are so gentle and so affectionate."

"Pray do not engage Juliet in the praises of her friends, if you wish to see them to-day," cried Mr. Markham, and they set out to the rectory.

Miss Villiers received her visitors with a courtesy of manner peculiarly her own. She possessed quick perception of character, and had a readiness in adapting herself to the tastes and habits of others, which caused every one, however much they differed from each other, to find time pass easily and delightfully in her society. The constancy and severity of her sufferings had never rendered her selfish, nor taught her to believe that the feelings and convenience of others must be without hesitation sacrificed to her own. On the contrary, every trifling instance of accommodation to her, and of sympathy for her, she received, not as a right, but as a favour.

Juliet had never yet seen Neville to such advantage as on this occasion; he was perfectly at his ease. With her he was often harassed by contending feelings; with Miss Villiers he readily followed in the track on which she led him, and conversed with her with remarkable judgment, knowledge, and taste, on subjects to which he had given previous thought. At length the two gentlemen rose to depart, for Mr. Villiers was not expected home. Juliet, much as she had enjoyed Neville's conversation, proposed to remain with Miss Villiers. With an affectionate smile, her friend acquiesced in her desire, and, as soon as they were alone, she said—

"My dear, what a very charming person your friend has proved; I had no idea you would bring me any one so handsome and so accomplished. It must be very delightful to spend days in his society, as you do, and it ought to be very improving, too, Juliet. I hope you will persuade him to come and see me again."

Juliet felt surprised that she had not made these observations for herself, for she acknowledged their truth, and that they proceeded from Miss Villiers's mouth, gave them great additional weight. Juliet had previously told her of the circumstances which had connected Neville with their family, and they now recurred to that theme, with an interest diminished in neither by their intercourse with him.

"I see that he regards you with peculiar affection," said Miss Villiers. "I could hear the very tone of his voice alter when he spoke to you. You see, my dear, neither my eyes nor hearing are grown very dull yet."

As Juliet walked home, she reflected on the favourable impression which Neville had made on Miss Villiers, and came rapidly to the conclusion that hitherto she had not at all duly appreciated him. As she went through the village she saw him at a little distance, and no sooner did he turn and perceive her, than he came towards her.

"May I accompany you in your walk?"

"Yes," replied Juliet, with frank satisfaction. "I have but a word to say at a cottage which we pass. I shall not delay you a moment, though, indeed, I know not why I should not defer this visit till to-morrow morning."

"I beg you not to do so. I like to see your English ways, Juliet, of which you know I have long lost sight. Above all, I like to see how you love these people, and how they love you. I prefer accompanying you now to doing so in a course of formal visits to people of elegance or fashion."

"Do you?" cried Juliet, with pleasure; "then we are quite agreed. I deplore my fate when the necessity arises which you describe. I yawn in anticipation,—in retrospection; and it is only politeness and a little awe of Mamma's indignation which prevents me from doing so at the time; but, when I go to yonder neat little cottage, I commonly stay twice as long as I intended. But don't look alarmed: I will not do so to-day."

"The reason why you do not find the conversation of these poor people dull, is probably because, however trivial is their subject, it is usually one in which they themselves take a lively interest, and this gives them the power of exciting your sympathy. This is a law of our nature."

"Much that one hears from them is indeed interesting," replied Juliet, "but it is usually of a mournful nature. How seldom the poor seem gay! I suppose it is because they realise, so much more than any other class does, the curse under which man labours, of earning his bread in the sweat of his brow."

"Apparently they do; but depend upon it, Juliet, that the curse falls not unfulfilled to the ground in any one instance. It extends from the peasant in his hut, to the king upon the throne."

"But those feel it most sharply, who must toil unceasingly, or starve!"

"I would not depreciate the hardships which the poor undergo. I would only assert on a broader scale, that, of all the modes of maintaining existence which necessity has invented, there is none without its peculiar sufferings, to which numbers of those who pursue it annually fall victims. The lawyer, the soldier, the physician, the statesman, those who encounter the perilous climate from which I return, all bear witness to this fact as much as the worn-out labourer, or the wretched artisan perishing of the pernicious atmosphere which he daily inhales. What is this but the universal working of the curse?—The curses of the fall have never been revoked. Men toil and die as they did before the Saviour of mankind came on earth, but, according to the merciful law of God, who ever works good out of evil for his faithful servants, there is a call heard by those who meekly listen: 'Come unto me, ye who are heavy laden, and I will give you rest'; and the sting of death is plucked out."

"I see the truth of all your words," replied Juliet, "but still the sufferings of the poor are of a more sacred character than any others can assume. Our Lord shared their lot in life, and committed them to our charge even as if they were himself—'I was an hungred.' Nor can I behold, without awe, pain such as the dear friend whom we saw to-day is visited with. Surely in those to whom pain is sanctified, as it is to her, we seem most plainly to discover the servants of a suffering master."

Juliet's countenance showed how deeply she felt on the subjects on which they spoke, and the mention of such themes created a stricter intimacy between her and her companion than had hitherto existed. Neville led her to speak of those with whose necessities she was well

acquainted, and who were the objects of her sincere commiseration, and he did this with the generous design of enabling her to relieve them. There were not many cases of pressing and unalleviated distress in this small and happy village, but Juliet, with a beating heart, reflected on one act of charity, far beyond her own power, and which she had often most ardently wished to see effected. This was the apprenticeship of the son of a poor widow to a trade which he had been learning under his father during his lifetime, which he was incapable of pursuing alone, and in which his mother could afford to give him no further instruction. Now Juliet knew these people well: she was quite sure that into this channel Neville's generosity might be safely directed. She could not speak without agitation. Her cheeks glowed and her eyes filled with tears, as she tried to explain all the circumstances to Neville. He was not difficult to satisfy, and he proposed to visit the widow, and carry their purpose into execution before they returned home."

"It was there I was going," replied Juliet; and, quickening her steps, and not speaking again, her heart was so full, she eagerly led Neville in the desired direction.

Juliet was soon at the door of the widow's cottage.

"Go in by yourself," said Neville; "I will wait your return under that lime tree."

"You ought to have the pleasure of doing this," replied Juliet, hesitating.

"No, no; the poor woman would only be embarrassed by seeing me."

Juliet, feeling that he was equally delicate and generous, entered alone.

"Oh! my dear Mary!" she cried with delight, (taking both the hands of the poor widow in hers,) "I have some very, very good news for you, concerning George. Oh! my good little Anna, (she said to a child who was trying to attract her notice,) I cannot attend to you now—run to play."

"Go into the garden, dear," said her mother, and putting the child out at the door, she returned with a face of great agitation.

"Well, now I will tell you all," continued Juliet, "there is a friend staying with us, a friend of my father's. He is most kind, and good, and generous. He is rich too, and he inquired of me if I knew any case of distress which he could relieve; and I thought of George, and how glad you would be to have him bound as an apprentice—and this he has promised to do."

Now if Juliet had not known her poor friend too well to expect words of thanks, she would have been disappointed, for none came. Mary changed colour, and looked ready to sink. Juliet made her sit down, and when she had done so, she took Juliet's hand, and pressed it repeatedly, but she could not speak. At length Juliet said, "I will come again to-morrow,—you will then have had time to think over all this,—and I will bring the gentleman with me."

Tears now came freely to the relief of the widow's full heart. "Thanks, thanks," she whispered, and Juliet, leaving the room, called Anna from the garden, and sent her to her mother, while she herself sought Neville. Her face wore a most touching expression of joy, for the tears of sympathy were still on her cheek; she took Neville's proffered arm, and exclaimed:

"I know not how to thank you, and I am sure she will never know how to thank you either;—with our lips I mean,—with our hearts we do."

Neville made no reply; at length he said in a voice of much emotion:

"Oh! Juliet, how have I desired to see you happy, and now I see you so; but it is only in the happiness of others."

Juliet answered in a low but firm voice:

"I am happy now." Then smiling she added, "Soon you will see me very happy, for my brother is coming home."

The next day Juliet and Neville did not forget their visit to Mary's cottage, nor did they omit anything that was requisite for the fulfilment of their benevolent purpose.

CHAP. IX.

One morning, Juliet received a letter, the seal of which Neville saw her break with glowing cheeks and sparkling eyes. After the first glance, she ran to the window, and beckoned to the younger children, who were playing in the lawn, to come to it. "Are there news of Albert?" they cried, as they obeyed her call.

"Yes, yes; he will be here this evening. Oh! what joy!" Mr. Markham entered the room. Juliet hastened towards him, and throwing her arms round his neck, cried: "Albert will be here to-night!"

Neville knew that Albert was the eldest son of his friend, or a year or two younger than Juliet. He was now at Sandhurst, receiving a military education. During the day, Neville talked with Mr. Markham of his future intentions with respect to his son, and told him that he thought his interest could procure him a cadetship, if it would be acceptable. This offer was received with gratitude for the kindness which prompted it, but Mr. Markham requested a little time for consideration ere he closed with it.

Evening came, and seven o'clock; the happy party walked down to a little bridge at a turn in the road, beyond which the coach did not come, and there awaited Albert's arrival. The children, ere long, wandered into the field at the road side to play. Mr. and Mrs. Markham walked up and down, the latter wondering that Neville did not join them; but Juliet had placed herself where she should see the coach the moment it appeared; and Neville was at her side, as if his interest were as lively as her own. At length the trampling of horses' feet caught Juliet's ear; then the children came running to the spot, and Mr. and Mrs. Markham followed. Now the horses gallop up the slight ascent,—they stop—a young man descends in haste from the coach-box, and runs to greet them. Now they have all welcomed him, and they gaze with fond admiration on his tall active figure, and handsome face; his clear brown eye and chestnut curls, and complexion glowing with health and joy. Neville has shaken hands with him, and they begin to move homewards. Juliet is hung on Albert's arm, as if he engrossed every thought and feeling; and they talked earnestly to each other in a low voice, as if they neither wished to be addressed or to be heard by any one else. Neville felt his first sensations of depression and restraint return in all their force; he felt quite out of place, at least quite out of the only place he cared to fill. His sudden gloom was perceptible to Mr. Markham, who would gladly have given Juliet a hint not to allow her brother wholly to distract her attention from a friend so lavish of kindness to her. But it was in vain that he called Albert to his own side, and made him reply to numerous interrogations. Neville did not avail himself of those exertions in his favour.

Never had Neville's reflections been more dispiriting than they were on that night. He felt convinced that he had deceived himself most absurdly, in supposing that Juliet had any real pleasure in his society. At last he resolved that in the morning he would plead a necessity for returning to London the following day. This resolution calmed him, and allowed him to taste of sleep. The next morning he wavered a little, but he heard Albert's voice calling to Juliet to come out and walk with him, and from his window he saw her hastening to join him, with a light step, which spoke a gayer heart than he had ever known her to possess. He sighed, and resolved that he would leave her to companions more congenial to her than he could be. Accordingly, as soon as the rest of the family had retired from the breakfast room, he announced to Mr. Markham his intention of returning to London. Mr. Markham

expressed annoyance,—could not guess the reason of this sudden decision,—but Neville was firm, and said that if Mr. Markham wished to consult him further about Albert, he must write to him. Mr. Markham left the room; in a few minutes Juliet entered it, and came to the window in which Neville was still standing. His first glance at her face told him, that, however glad her feelings were a few minutes since, they were quite changed now; he felt anxious to know the cause, and Juliet meant not to leave him in ignorance of it. Her voice was a little tremulous, her cheeks a little flushed.

"Mr. Neville," she said, and paused; "is it possible that, as Papa tells us, you are going to leave us to-morrow? Must you really do so? You never said so before, and I am so disappointed. Just as Albert is come, whom I so much wished you to know; I said I would try to make you change your resolution; now, pray, do not send me away with a refusal." And Juliet, instead of smiling, as she probably expected to do, was forced to turn away her head to conceal the tears which had started to her eyes: she was as much surprised at her own emotion as Neville could be. He could not resist the impulse of the moment; he took her hand, and said in a low earnest voice: "Juliet, I will not deceive you by pleading any false necessity for departure. I go from the sight of so much happiness which I may not share."

"I hoped that you would share it more from day to day," replied Juliet, sorrowfully.

"If I were to tell you the mad, vain wishes, the accomplishment of which could alone make this place any longer tolerable to me, you would bid me go, you would bid me to grow wiser and calmer ere I saw you again. Juliet, you are too sincere, too generous to counsel me untruly." The blood rushed crimson to Juliet's cheek and brow. She burst into tears; but Neville thought he read more than compassion in them. He bent over her, and murmured: "Must I go?" "Yes," exclaimed Juliet, "if you wish to destroy the happiness which you have striven to create."

"So, Juliet," cried her father, "you have prevailed on Neville to remain! But the enchantress was forced to try her most potent spells ere she could lure the knight back to her bower."

Juliet tried to smile at her father's bantering, but her heart was too full; she threw herself on his neck, and clung silently to him.

"My dear child," said Mr. Markham, with emotion, "I am heartily rejoiced that you sent him not away in despair. May his noble heart never know another pang! Well! I suppose now he has some chance of sharing your thoughts, looks, and words, with Albert?"

"Ah! dearest father," cried Juliet, smiling joyfully, "I hope to reverse all his schemes, for Albert shall never go to India."

FRANK FAIRLEIGH;

OR, OLD COMPANIONS IN NEW SCENES.

By F. E. S.

CHAP. XII.

HOW OAKLANDS BROKE HIS HORSE-WHIP.

THE sight which met my eyes as I gazed around, was one which time can never efface from my memory. In the centre of the room, his brow darkened by the flush of concentrated indignation, stood Oaklands, his left hand clenching tightly the coat collar of a man, whom I at once perceived to be Wilford, while with his right he was administering such a horse-whipping as I hope never again to see a human being subjected to. Wilford, who actually writhed with mingled pain and fury, was making violent but ineffectual struggles to free

himself. Near the door stood Wentworth, the blood dropping from his nose, and his clothes dusty and disordered, as if from a fall. Crouching in a corner at the farther end of the room, the tears coursing down her cheeks, which were blanched with fear, and her hands clasped in an agony of terror and despair, was a girl, about nineteen years of age, whom I had little difficulty in recognising as Lizzie Maurice, the daughter of the old confectioner, of whose elopement we had been that morning informed. On perceiving me, she sprang forward, and, clasping my knees, implored me to interfere and endeavour to separate them. I was not, however, called upon to do so, for, as she spoke, his riding whip broke short in Oaklands's hand, and dashing down the fragments with an exclamation of anger, he flung Wilford from him with so much force that he staggered forward a few paces, and would have fallen, had not Wentworth caught him in his arms, just in time to prevent it.

Oaklands now turned to the girl, whom I had raised from the ground and seated on a chair, and addressing her in a stern impressive manner, said, "I will resume what I was saying to you when yonder benten hound dared to lay hands upon me. For the last time the choice is offered to you—either return home, and endeavour, by devoting yourself to your broken-hearted old father, to atone as best you may for the misery you have caused him; or, by remaining here, commence a life of infamy which will end sooner or later in a miserable death." He paused; then, as she made no reply, but sat with her face buried in her hands, sobbing as if her heart would break, he continued, "You tell me, the vile tempter who has lured you from your duty promised to meet you here to-day, and, bringing a clergyman with him, to marry you privately; now if this is the truth—"

"It is, it is," she faltered.

"If so," resumed Oaklands, "a knowledge of the real state of the case may yet save you; this Mr. Wilford who has promised to marry you, and who belongs to a rank immeasurably above your own, is already notorious for what are termed by such as himself affairs of gallantry—while the wretched impostor whom he has brought with him, to act the part of clergyman, is the marker at a low billiard-table, and no more a clergyman than I am."

"Is this so?" exclaimed the girl, raising her eyes, which were swollen and red with weeping, to Wilford's face; "would you have deceived me thus, Stephen? you, whom I have trusted so implicitly."

Wilford, who, since the severe discipline he had undergone, had remained seated, with his head resting on his hand, as if in pain, apparently unconscious of what was going on, glared at her ferociously, with his piercing eyes, but made no reply. The girl waited for a minute, but, obtaining no answer, turned away with a half-shudder, murmuring, "deceived, deceived,"—then addressing Oaklands, she said, "I will go home to my father, Sir! and if he will not forgive me, I can but lie down, and die at his feet—better so, than live on, to trust, and be deceived again."

"You have decided rightly, and will not repent it," remarked Oaklands in a milder tone of voice—then, turning to the blacksmith, (who had made his appearance, accompanied by his wife, the moment the affray had ended,) he continued; "you must procure some conveyance immediately to take this young person back to Cambridge, and your wife must accompany her."—Then, observing that the man hesitated, and cast an inquiring glance towards Wilford, he added sternly, "If you would not be compelled to answer for the share you have taken in this rascally business before the proper authorities, do as I have told you, without loss of time."

The man having again failed in an attempt to attract Wilford's attention, asked in a surly tone, "whether a spring-cart would do?" and, being answered in the affirmative, left the room.

Lizzie Maurice withdrew to prepare for her return home; the woman accompanied her; Oaklands strode to the window, and remained watching the operation of harnessing the horse to the tax-cart. Wilford still retained the same attitude, and neither spoke nor moved. Wentworth having glanced towards him once or twice, as if to divine his wishes, receiving no sign, lit a cigar, and leaning his back against the chimney-piece began to smoke furiously, whilst I devoted myself to the pages of an old sporting magazine—Thus passed five minutes, which seemed as if they would never come to an end, at the expiration of which time the tax-cart, driven by a stout country lad, drew up to the door, and the two women making their appearance at the same moment, Oaklands turned to leave the room. As he did so, Wilford for the first time raised his head, thereby disclosing his countenance, which, pale as death, was characterised by an expression of such intense malignity, as one might conceive would be visible in that of a corpse of which a fiend had taken possession. After regarding Oaklands fixedly for a moment, he said, in a low grating tone of voice, "You have fooled me once and again—when next we meet, IT WILL BE MY TURN THEN!" Oaklands merely smiled contemptuously, and quitted the house.

Having mounted our horses, we told the lad who drove the spring-cart to proceed at his fastest pace, while we followed at a sufficient distance to keep it in sight, so as to guard against any attempt which might be made by Wilford to recover himself of his victim, without positively identifying ourselves with the party it contained.

We rode in silence for the first two or three miles; at length I could refrain no longer, and, half uttering my thoughts aloud, half addressing my companion, I exclaimed, "Oh, Harry, Harry, what is all this you have been doing?"

"Doing!" replied Oaklands, with a heightened colour, and flashing eyes, "rescuing an innocent girl from a villain who would have betrayed her, and punishing the scoundrel about half as severely as he deserved; but that was my misfortune, not my fault; had not the whip broken—"

"You know that is not what I mean," returned I; "but this man will challenge you, will—you are aware of his skill—will murder you. Oh! that fiendish look of his, as you left the room,—it will haunt me to the day of my death."

"And would you have had me leave the poor girl to her fate, from a coward fear of personal danger? You are strangely altered since you defied a roomful of men last night, rather than allow Clara Saville's name to be uttered by their profane lips; or, which is nearer the truth," he continued in a milder tone, "your affection for me blinds you."

"Not so, Harry," replied I, "it is the recollection of my own feelings, when, while waiting for Lawrence's report last night, I believed I should be forced to meet this Wilford—it is the misery, the self-reproach, the bitter penitence of that moment, when, for the first time, I was able to reflect on the fearful situation in which by my own rashness I had placed myself, a situation in which crime seemed forced upon me, and it appeared impossible to act rightly—it is the remembrance of all these things which causes me to lament that you, my more than brother, should have involved yourself in similar difficulties."

"But, Frank," he began,—then, interrupting himself, he seized my hand, and, pressing it warmly between his own, exclaimed, "My dear old fellow, forgive me if I have spoken unkindly to you; but this man has maddened me, I believe,"—he paused, and then continued in a calmer voice, "Let me tell you how it occurred, and you will see I could scarcely have acted otherwise than I have done. You know I went into the public-house to brush the mud off after my tumble. The instant my step sounded in the passage, a girl tripped lightly

down the stairs, and ran towards me, exclaiming joyfully, 'you have come at last, then!' On finding that it was not the person she expected, she stopped in alarm, and I perceived to my astonishment that it was Lizzie Maurice—she recognised me at the same moment, and apparently a new idea struck her, for she again approached me, saying, 'Mr. Oaklands, tell me Sir, for Heaven's sake, has anything happened to Wilford?' Then, with woman's tact perceiving her mistake, she blushed deeply, adding in a timid voice, 'I fancied you might have been riding with that gentleman, and seeing you alone, I was afraid some accident might have befallen your companion.' At this moment the thought occurred to me, that possibly it might not be too late to endeavour to restore her to her father, and the recollection of Archer's account of the old man's distress determined me to make the attempt.

"Taking her therefore by the hand, I led her into the parlour, and, begging her to listen to me for five minutes, told her I was aware of her elopement, and entreated her to return home again, adding that her father was broken-hearted at her loss. She shed tears when I mentioned the old man's grief, but positively refused to return home.

"Finding persuasion to be of no avail, I thought I would appeal to her fears; so I informed her that I was aware of the name of the villain who had enticed her away, that I would seek him out and expose him, and that I should instantly acquaint her father with her place of refuge, and advise him to come provided with proper powers to reclaim her. This produced more effect, and after some hesitation she told me proudly, that I had done her foul wrong by my doubts; that Mr. Wilford meant to make her his lawful wife; but that, in order to prevent his great relations hearing of it till he could break it to them cautiously, it was advisable to keep the affair quiet (the old story in short, private marriage and all the rest of it)—a friend of Wilford's, therefore, to avoid exciting suspicion, had kindly driven her over there the night before, and she was now expecting him to come, and bring a clergyman with him, who would marry them by license on the spot, and, when she heard my step, she thought they had arrived. The air of truth with which she said this carried conviction with it.

"I was about to represent to her the improbability of Wilford's intentions being as honourable as she fondly imagined, when a gig drove up to the door, containing Wentworth, and a fellow whom I recognised as one of the billiard markers in — street, dressed in black for the occasion; immediately afterwards, Wilford arrived on horseback. The whole thing was now perfectly clear. Wilford, having made the girl believe he meant to marry her, persuaded Wentworth, who is completely his tool, to carry her off for him, after which he went to Lawless's wine party in order to show himself, and thereby avert suspicion; he then bribed the billiard marker to play poson, got Wentworth to bring him, and going out as merely for a ride had joined them here. I was considering what would be the best course to pursue, and was just coming out to consult you, when the door was flung open, and Wilford and Wentworth entered hastily. The moment Wilford's eyes fell upon me, he started as if a serpent had stung him, and his brow became black as night.

"Advancing a step or two towards me, he inquired in a voice hoarse with rage, what I was doing there. I replied, 'Endeavouring to prevent some of his evil designs from succeeding.' He tried to answer me, but his utterance was literally choked by passion, and turning away, he strode up and down the room, gnashing and grinding his teeth like a maniac. Having in some degree recovered his self-control, he again approached me, drew himself up to his full height, and pointing to the door, desired me to leave the room.

"I replied, I should not do so, until, having given the young lady a piece of information respecting the cha-

racter of one of the party—and I pointed to the billiard marker, who had not yet alighted—I should learn from her own lips whether she still wished to remain there, or would take my advice, and return to her father.

"Again Wilford ground his teeth with rage, and desired me in a voice of thunder, to 'leave the room instantly,' to which I replied flatly, that I would not.

"He then made a sign to Wentworth, and they both approached me, with the intention of forcing me out. Fearing that their combined efforts might overpower me (for Wentworth, though short, is a broad-shouldered, strong man, and Wilford's muscles are like iron), I avoided their grasp by stepping backwards, and throwing out my right hand as I did so, caught Wentworth full on the nose, tapping his claret for him, as the pugilists call it, and sending him down like a shot. At the same moment Wilford sprang upon me, with a bound like a tiger, and seizing me by the throat, a short but severe struggle took place between us. I was too strong for him, however, and, finding this, he would gladly have ceased hostilities and quitted me, kindly postponing my annihilation till some future day, when it could be more conveniently accomplished by means of a pistol-bullet. But, as you may imagine, my blood was pretty well up by this time, and I determined he should not get off quite so easily. Seizing, therefore, my whip in one hand, I detained him without trouble with the other—his strength being thoroughly exhausted by his previous exertions—and administered such a threshing as will keep him out of mischief for a week to come, at all events. It was while this was going on that you made your appearance, I think, so now you are *au fait* to the whole affair—and pray, what else could I possibly have done under the circumstances?"

"It is not easy to say," replied I. "I think the horse-whipping might have been omitted, though I suppose the result would have been the same at all events, and it certainly was a great temptation; the brightest side of the business is your having saved the poor girl, who I really believe is more to be pitied than blamed, having only followed the dictates of her woman's nature, by allowing her feelings to overrule her judgment."

"You have used exactly the right expression there," said Oaklands; "in such cases as the present, it is not that the woman is weak enough to be gulled by every plausible tale which may be told her, but that she has such entire confidence, such pure and child-like faith in the man she loves, that she will believe anything rather than admit the possibility of his deceiving her."

"The deeper villain he, who can betray such simple trust," replied I.

"Villain, indeed!" returned Oaklands. "I would not have been in Wilford's place, to have witnessed that girl's look when the conviction of his baseness was forced upon her, for worlds; it was not a look of anger or of sorrow, but it seemed as if the blow had literally crushed her heart within her—as if the brightness of her young spirit had fled for ever, and that to live would only be to prolong the duration of her misery. No; I would rather have faced death in its most horrible form, than have met that look, knowing that my own treachery had called it forth."

We rode for some little distance in silence. At length I inquired, how he meant to arrange for Lizzie Maurice's return to her home, as it would not do for us, unless he wished the part we had taken in the affair to be known all over Cambridge, to escort her to her father's door, in the order of procession which we were then maintaining.

"No, I was just thinking of that," replied Oaklands. "It appears to me, that the quietest way of managing the affair will be, to pay the boy for the horse and cart at once, telling him to set Lizzie Maurice down within a short distance of her father's shop, and then to return with the woman. Lizzie can proceed on foot, and

will probably at this time of the evening (it was nearly seven o'clock) be able to enter the house without attracting attention—we will however keep her in sight, so as to be at hand to render her assistance should she require it. I do not myself feel the slightest doubt but that her father will believe her tale, and treat her kindly. I shall however leave her my direction, and should she require my testimony in support of her veracity, or should the old man be unwilling to receive her, she must inform me of it, and I will call upon him, and try to bring him to reason."

"That will not be necessary, depend upon it," returned I, "he will be only too glad to recover her."

"So I think," replied Oaklands.

"What course shall you take with regard to Wilford?" inquired I.

"I shall never mention the affair to any one, if he does not," answered Oaklands; "neither shall I take any step whatever in the matter. I am perfectly satisfied with the position in which I stand at present, and if he should not enjoy an equal share of contentment, it is for him to declare it—the next move must be his, and it will be time enough for me to decide how to act, when we see what it may be. I shall now tell Lizzie Maurice of my plan for her, and inform her, that as long as I hear she is living quietly at home, and leading a respectable life, my lips will be sealed with regard to the occurrences of to-day." So saying, he put his horse into a canter, and riding up to the side of the cart, conversed with the girl in a low tone of voice for several minutes; then, drawing out his purse, handed some money to the driver, and rejoined me. "She is extremely grateful to me for my promise of silence," he commenced; "appears very penitent for her fault, and declares that this is a lesson she shall never forget.—She agrees to my plan of walking, and it appears there is a side door to the house, by which she can go in unobserved. She promises to tell her father everything, and hopes to obtain his forgiveness; and seems altogether in 'a very proper frame of mind,' as the good books say."

"Long may she keep so," returned I; "and now I am happy to say, there are some of the towers of Cambridge visible, for like you I am becoming fearfully hungry."

"And for the first time during the last twenty-four hours I am actually beginning to feel as tired as a dog," rejoined Harry, shrugging his shoulders with an air of intense satisfaction.

THE EMPEROR'S BROTHER.

In days of yore, Menelaus was emperor of Rome, mighty in power, great in his wealth, and good and charitable in all his ways. His empress was Euphemia, the daughter of the king of Hungary, as fair as he was powerful, as gracious as he was rich, as merciful as he was charitable. Some time had these twain lived in peace and happiness, to their own joy and the comfort and benefit of their subjects.

Now it was in those days that hermits came from the East, bearing the marks of punishment on their bodies, and worn down with hunger and pain; for the Saracen was great in the Holy Land, and the way of the pilgrim to the sepulchre was beset with every peril that nature and man could place around it. To the Roman capital came the weak Eustace; day and night he spoke of the sufferings of his brethren, of the power and cruelty of the Soldan and his people; day and night, in the courts of the king's palaces, and in the crowded markets, he called upon the rich to contribute their wealth, the powerful their power, the warriors their

might, the pious their prayers, for the redemption of God's sepulchre from the hands of cruel Infidels.

And then it was that Rome was mightily stirred at the exhortations of the pilgrim, and all men hastened to do his bidding. Then it was that the wealthy poured out their wealth at his feet, and even the miser gave from his store; then it was that the counts and the lords called upon their vassals, that the warriors buckled on their armour, that the pious prayed day and night for God's blessing on the coming Crusade. One and all they sought the king's palace, and besought their emperor to lead them to their Christian enterprise; long he bethought himself of their supplications, and in the end acceded to their united requests.

When the day was come that the warriors should proceed on their way to the rendezvous, Menelaus called to him his wife and his sole brother.

"Lady, dear lady," said he, "you know that from you I have hid nothing, and how that I go with my people to the Holy Land."

"Even as thou sayest, my lord."

"And now, therefore, dear lady, thee do I constitute regent and governor in my place, over all my people and against all my foes; and this my brother I constitute chief steward and adviser under thee."

Then said the empress: "Since it will no otherwise be, my lord, but that needs thou wilt go to the Holy Land, in your absence I will be as true as the turtle-dove to its mate; for, as I believe, you shall not escape thence with your life."

And now the hour of departure arrived, the trumpets sounded in the streets, the banners waved on all sides, and the ways of the city were crowded with armed men on horse and foot, each bearing the cross on his shoulder, and waiting but the forth-coming of Menelaus to march towards Jerusalem. Many a yeoman kissed his wife and child for the last time; many a gay young knight looked his last on the fair face of his mistress, and many a count and baron looked for the last time on his fair fields and his strong battlements. With fair words of comfort, and earnest embraces, the emperor parted from his wife and led the gay cavalcade through the city's gate.

Antony, the king's brother, was among the few bad men that regarded with joy the departure of Menelaus. Entrusted by the empress with the chief executive of the empire, he soon became proud and tyrannical, oppressive to the poor and a robber of the wealthy. The face and beauteous person of the queen stirred him to wickedness, and day by day and hour by hour he besought her with every fair word to forget his absent brother, and be unto him as a wife.

It was all in vain that Euphemia reproved him for his wickedness and threatened him with punishment; for he ever went on still in his wicked ways, and ceased not in his villanies. Then did the empress call together three or four of the good and great nobles of the empire, and say thus unto them:

"Ye are not ignorant, my lords, that the emperor ordained me his chief regent and governor, and placed his brother, the Lord Antony, as chief steward under me, to do every thing that I should will, but nothing without my consent."

"Yea, it is even so, great lady."

"Know ye not also, my lords, that the contrary of all this he does, disregarding my commands, oppressing the poor, and robbing the rich?"

"To our cost, and to the evil living of our vassals, know we this, O lady."

"But, my lords, more than this, the Lord Antony daily tempts me to forget our lord the emperor and to sin against him. Now, therefore, great and doughty lords, I command you, in my lord's name, that ye seize the traitor the Lord Steward, bind him fast, and keep him in prison."

"We be ready to obey thy commands, O lady! but in this thou must answer for us to our lord the emperor."

"Fear not," rejoined the empress; "did but your lord know what I know of this man, he would assuredly put him to an ignominious death."

Immediately the great nobles took the Lord Antony, bound him fast in fetters, and threw him into a strong dungeon, where he lay a long time; until at last there came tidings from the East that the emperor had obtained great renown and victory, and was coming homeward. Now when Antony heard this, he said to himself: "If my brother find me in prison, will he not inquire of the empress the cause of my imprisonment, and will she not tell him all that ever I have done, and shall I not lose my life?" and then he thought awhile by himself and said, "Nay, nay, but it shall not be so;" and, sending humbly to the empress, he besought that he might speak a word unto her.

"Man," said the empress, "what wouldst thou with me?"

"Mercy, mercy, O lady! for, if the emperor my brother find me in prison, shall I not die," and with these words he fell at her feet, and wept sorely.

"My Lord Antony," replied the empress, "could I but feel assured that thou didst repent thee of thine old ways, thou shouldst find grace in my sight."

On this, with many and deep protestations, Antony persuaded the empress that he had repented him of all his former evil deeds and wishes, and obtained so far with her that she took him from his dungeon, reinstated him in his office, and bade him mount his steed and come with her and the rest of the nobles to meet the returning emperor.

Fair and bright was the day on which the nobles and their empress set out from Rome to meet their long lost emperor, and merrily did they converse as they rode over moor and through wood, over hill and through valley, on their way. And now, as they journeyed on, a bold buck started across their path and made away across the meadows; then all the nobles followed in chase, and the empress and Antony were left alone, as if by chance. Then did the evil one tempt Antony, and he spoke again to Euphemia of love, counselling the death of his brother, and their union as man and wife.

"Wicked fool," said the empress, "was it not but yesterday that I delivered thee out of prison, upon thy promise of amendment, and now art thou returned to thy wickedness and folly?"

"Remember, lady! when thou didst so, thou wert surrounded by thy nobles and thy soldiers; now art thou alone, for there is no creature here but thou and I; listen, how the horn sounds more and more faintly, and the chase draws away thy company—obey then my wishes, or prepare to die, for in this wood on yonder tree will I hang thee, and thou shalt there die a miserable death."

"My lord," replied the empress with meekness, "I can die,—I cannot sin."

As she thus spake, Antony seized on Euphemia, stripped her of her imperial garments, and hanged her by her beautiful hair to a tree in a dark depth of the forest; then he rode after the hunters, and, with many tears, and much apparent anger, told them, how many enemies had suddenly surrounded them and bore away the empress, in spite of his greatest exertions.

For nigh three long and weary days, the empress hung on that tree, suffering all the agonies of a death by famine added to the pain of her torturing position. On the third day, a horn sounded through the wood, and the cry of dogs reached far and wide, as the Count Ernest, the lord of a fair domain that bordered on the territories of the emperor, pursued the chase. Fast followed the hounds on the buck that flew before them, until they reached the place where the empress hanged on the tree. In a moment the chase was stopped, and every hound stood and bayed around the spot, until the count and his attendants rode towards the tree.

"Woman," said Count Ernest, "who art thou and whence come, that thou hangest thus on this tree?"

"Good Sir," murmured Euphemia, in a low and weak voice, for her life was fast declining, "a strange woman am I, come from a far country, and of good lineage and fair repute, but how I came I cannot tell."

"Whose then is this horse that stands bound beside thee?" asked the count.

"Good Sir, it is mine own, and oh! mercy, good Sir, that I die not."

"Fair lady," rejoined Ernest, as he hastened to take her down from the tree, and to restore her departing animation by a draught from his hunting flask, "fair lady, I perceive that thou art as well born as thou art fair, and hast come to this mishap by some unfair means, that thou wilt not declare. Come then, lady, come to my castle, for there is to me an only child, a young daughter, and if thou wilt be kind to her as a mother and be her instructress in all that befits her station, great shall be thy reward."

Full of thankfulness and gratitude, Euphemia leapt upon her palfrey, and rode with Count Ernest to his baronial hall. Welcomed by all, from the highest to the lowest, the empress addressed herself with pleasure to her task, tending with a mother's care the daughter of her benefactor. Well for her would it have been at this time had her personal beauty and grace of manners been less remarkable, for the count's steward, a crafty and a wicked man, loved her greatly, and spake to her again and again of his love. It was in vain that Euphemia told him that she was married, and that her love was firmly bound to but one, for he continued to reiterate his endearments, and to ply her with crafty arguments and wicked suggestions.

"Sir Steward," quoth the empress at last, "what need you more to ask such things, and to frame such speeches. The vow that I have made, that will I keep by God's grace unto my death's day."

"Of a short duration shall thy vow be," muttered the Steward, as he turned and left the chamber of the empress.

For a time all went well, and Euphemia forgot the threat of the count's steward, and gave herself up to the free enjoyment of her happy situation. One night, as she slept in the same bed with her young charge, deeply sleeping in peaceful security, the steward entered the chamber, which branched out from that of his master, crept close to the bed of the sleepers, and with a knife cut the throat of his master's child, so that she died in her sleep. Then did he smear the linen of the sleeping empress with the innocent's blood, and place the stained knife within her hand.

Hardly had the steward passed out from the scene of his wicked cruelty, when the countess, alarmed by a dream, arose from her neighbouring couch and entered the room of her daughter. Her first look all but killed her. Repressing the screams that all but forced themselves on her utterance, she awoke the count, and together they stood by the bedside of the murdered child, and her innocent nurse.

"Awake, woman, awake!" cried the count, "see this thing that thou hast done, and the fatal knife even yet in thine hand."

Who shall tell how the empress awaked out of her sleep, and saw the dire deed, and heard the words of accusation against her; how she mourned for her lost pupil, and protested her innocence in the face of the plain evidence that appeared against her; how the countess called for death as her punishment, and the empress sued not for mercy.

Sorely was the count tempted to slay the empress, but he remembered how it had been said of old, "Vengeance is mine, I will repay," saith the Lord. Then he said,—

"Woman, were it not that I fear God greatly, I would cleave thee in twain with my sword, for I delivered thee from the point of death, and now, look, thou hast slain my child! Go, woman, I give thee thy wretched life, from me thou shalt have no harm; but if, after the

sun hath gone down into the west, thou art found within my dominion, a cruel death shall be thy fate. Ho! groom, the palfrey of the strange woman—let the murderess depart as she came."

Cut to the heart with the bitterness of her sorrow, the empress rode away from the count's castle without a tear, for she well knew her innocence, and trusted in it. Eastward many a day she rode, without friend or guide, living on the bounty which she had acquired in the service of Count Ernest. As she rode thus she espied by the wayside a lofty gallows, and officers preparing to hang a man thereon. Remembering her own fate, Euphemia rode up to the officers.

"Sirs," said the empress, "is this man redeemable from this straight death?"

"Yes, lady," replied the officers, "and his ransom is twenty pieces of silver."

"It pleaseth me well to redeem him," rejoined the empress; "go to, here are the pieces. Sir! follow me; be true servant unto me until I die, for from death have I delivered thee."

With many a protestation and oath the culprit promised to be true and faithful, and followed readily by her palfrey's rein until they drew nigh unto a fair city on the sea side, where Euphemia was minded to dwell.

"Euric," said Euphemia, for this was the culprit's name, "go forward to yon city, and seek out there a fair and honest lodging, for I will rest here awhile."

The lodging was soon obtained, and Euphemia lived for a while in the city, and her beauty became a common report among all the citizens. Now it happened that a merchant vessel came in there from the East, laden with fine clothes and goodly apparel from far countries. Euphemia sent Euric to the shipmaster to learn of his commodities, and to bring him to her house, that she might traffic with him for his Eastern cloths. Willingly the shipmaster came, for he had heard of the lady's beauty; willingly he agreed to sell her of his cargo, and bade Euric return with him to the ship that he might bring back cloths the Empress had ordered.

"Friend," said the shipmaster, when he and Euric were once again on board, "canst thou be trustworthy, and art thou willing to earn a good reward?"

"My aid and my silence have their price," rejoined Euric.

"Come then. I love thy lady, and would give much to have her here on board, that I might sail away with her. Here are twenty gold pieces if thou wilt tell her that I will not sell her the cloth unless she come and choose it here herself, and then leave the rest to me."

"It is well spoken, master; I do thy bidding."

As the shipmaster planned, so it fell out. The empress believed her servant's report and descended to the port and went on board the merchant's ship, whilst Euric stood without on the harbour's side. Then the shipmaster raised his sail, and sailed out from the harbour's mouth.

On the shores of Italy, within the empire of Rome, there was at that time a great city, famous for its baths, whither the sick resorted, and whence they received great aid. Many and wise were the physicians that abided there, and great their reputation throughout all the Roman land, so that all men resorted thither in their sicknesses. Thither had come among the crowd of sick, the Lord Antony, whom his brother had found, on his return, a leper from head to foot. Thither too had come for aid the steward of the Count Ernest, blinded, deaf, and shaking with the palsy; Euric, lame and aching with cramp pains in every joint; and the shipmaster distraught of his wits. Each and all of them proffered large gifts in return for health, but in vain; for their diseases were beyond the power of the physicians of the place.

"What, then, shall we do?" said they one and all.

Then said the people, "Go ye to the pious sister, that dwells in the hermitage on the sea shore, whither she escaped from shipwreck; confess to her your misdeeds,

and by God's help she will give you rest, for by the grace of God she doeth many wonders."

Then went they all to the hermitage on the sea shore, and the emperor went with his brother, for he knew not of his wickedness, and loved him much. Before the door of her humble cell stood the recluse, her form and face shrouded with dark habiliments, so that no one could see her features. To the emperor the recluse made a reverent salutation, but of the rest of the sick, or of the crowd that followed them, she took no heed.

"Good sister," said the emperor, "if thou wilt of thy kindness heal my brother of his leprosy, ask of me what thou wilt, and on the word of the great king I will give it thee."

"Great and good lord," replied the recluse; "though thou wouldest give me the half of thy kingdom, I may not heal thy brother of his leprosy, nor none of these other sick, unless they freely and openly confess all the evil that ever they did."

"Brother," said the emperor, "hearest thou the words of the holy sister; acknowledge then openly all thy sin, that thou mayest be healed of this wickedness."

"Truly, O my brother, have I sinned against thee, and done to thee and thy kingdom great evil, for I obeyed not the commands of our dear sister that is taken from us, but cruelly oppressed the poor, and took bribes of the rich or spoiled them of their treasures. Freely do I confess my evil, and implore thy pardon."

"As free as thy confession, so is thy pardon, brother!" rejoined Menelaus. "Sister, heal him of his leprosy."

"Such as his confession, such is his cure. The former is not full, therefore my medicine little availleth."

"What evil, sorrow, or other unhappy wretchedness hast thou committed, O my brother?" said the emperor. "Seest thou not how thou art a foul leper? Confess, then, all thy sin that thou mayest be whole, or avoid my sight for ever."

"Cursed as I am with a foul disease, I may not tell of my sin against thee, oh I my brother, unless I be sure of thy grace."

"Speak on then, for freely art thou forgiven."

Then did Antony declare how he had tempted the empress, deceived her by his promises, and hanged her in a wood on the very day of his brother's return.

"Wretched creature," cried Menelaus, "God's vengeance has fallen on thee. In that I have pardoned thee thou art free; else would death, a bitter death, have been thy lot."

"My Lord," interposed the count's steward, "what lady you speak of I know not, but of this be assured, that such a lady my master the Count Ernest found on a time hanging in the forest, and brought her home to his castle, and made her nurse of his only child; fair was she, very fair to look upon, and I tempted her to love me, but she ever swore to keep the oath that she had sworn before God's altar. Then slew I my master's child, and placed the bloody knife in the lady's hand whilst she slept, so that my master accused her of the guilty deed, and cast her out of his kingdom."

"And such a lady—fair, very fair to look upon, and gracious in all her deeds," said Euric, "ransomed me from the officers at the gallows foot, and made me swear to be her true and liege servant until her death; but I sold her for gold to a shipmaster, and he bore her away no one knoweth whither."

"Such a lady," interposed the shipmaster, "received I of a foreign man, and when we were in the midst of the sea I would have constrained her to my love, when she fell down on her knees, and prayed for deliverance. Then arose a great and a terrible storm, and day and night we drove I know not whither, for the sky was dark, and the winds and the waves roared terribly. At last the ship broke in pieces, and we were all drowned save wretched I, who floated to land on a piece of the broken vessel."

"Wretched, wretched men," cried the emperor, "ye shall surely die."

"Nay, good and great king," interposed the recluse, "God's vengeance has fallen on them, as it is said, Vengeance is mine, I will repay. Be merciful, oh! my Lord; and ye, poor creatures, fear not! freely have ye confessed and truly, and freely are ye cured."

As she thus spake, each man's disease left him, and they fell on the ground in praise and thanksgiving to God. Then turned the recluse to the emperor, and uncovered her face.

"Husband and great master, be merciful, for thy Euphemia has escaped from all her troubles, and now on her bended knee asks thee for pardon to these poor miserable sinners."

"Blessed be God!" cried the emperor, as he raised his long lost empress to his arms. "Blessed be God, I have found that I desired. Go ye all in peace. But far away from this land, lest when I look on ye again, I may forget mercy and remember justice."

A CHRISTMAS PARTY IN THE COUNTRY.

CHAP. X.

THE WELCOME ARRIVAL.

As too frequently happened, Justine L'Estrange was the last who appeared at the breakfast-table at Kirkfield. She received Mr. Loraine's gentle reproof for not having been present at prayers with many insufficient excuses for her laziness, when Charley Loraine, gravely taking out his pocket-book, and presenting her with a stolen charade, begged she would read it aloud, as she had fully earned its possession, and had done so even sooner than he had expected. "Read it! do read it!" exclaimed two or three of the younger of the party, as Justine's eye glanced over it, and with a reproachful voice, she said—"Oh, Charles!"

"Come, my dear cousin," said Charles, in reply, "if your modesty be too great to allow you to read aloud verses, whose first line must certainly have been addressed to you in the spirit of inspiration or of prophecy, I will spare your blushes, and read them for you." And, taking the paper from her hand, in spite of a slight resistance, he began:—

"Awake, idle sleeper! Up! up, and arise!
Already my *First* hath made vocal the skies.
Arouse thee! Arouse thee! Mount horse and away,
For long is the journey before thee to-day!"

"Forget not my *Second*; when weary thy steed,
By that thou shalt urge on his lingering speed;
For many a forest and ford must be past
Before thou shalt reach thine own cottage at last."

"And ere through thine own cottage-garden thou'lt tread,
The dew of the night on my *Whole* will be shed,
On my beautiful *Whole*, yet less blue and less bright
Than the eyes which will meet thee with glistening delight."

This charade produced many remarks on the flowers which derive their names from different birds; and the same subject was renewed in the evening, when the *Flora Kirkfieldensis* was introduced to the increased party; for increased it had been during the day greatly to Agnes' delight.

Agnes was always the first to welcome the letter-bag; but on this day even the letter-bag was overlooked in her joyful surprise at seeing the carpet bag and portmanteau, which the post-boy lifted out of his non-descript little vehicle, saying, "Them's t' gentleman's things as cam by t' Sooth mail, and sed he wer boun to walk ower t' fields fra' B—, and I war to bring 'em here, an' tell ye he war coming."

It must be—it could be nobody but her long-expected friend, James Hamilton, who was actually arriving three days before her birthday! With gleeful voice and bounding step she entered the saloon with the

news, and entreated some of the party to accompany her into the fields to meet the wished-for guest; but, before they could set out, Mr. Hamilton himself made his appearance, and was greeted by them all as a most welcome visitor.

Much had to be told by both parties, many questions asked, and many kind inquiries made after the invalid, whom he had left rapidly improving under the care of his aunt; and the party once more found the evening circle closed in before they remembered to thank Mr. Hamilton for his charades, to talk of the amusement they had afforded, and the interest they had given to Sophia's drawings in the eyes of her cousins. Charles declared his abstraction of one from the number must certainly have been the cause of accelerating James's arrival; and, though too polite to Justine to explain how very apropos the address, "Awake, idle sleeper!" had proved that morning, he could not refrain from expatiating a little on the advantage of rising with the lark, till she was glad to take refuge in an examination of the portfolio, and ask some question about the *Delphinium Consolida*, or *Larkspur*, remarking that in her native country it had a similar name, and was called *Pied d'Alouette*.

"Yes," replied Sophia, "there must be some resemblance to the foot or spur of the lark, or at least to a spur of some kind; though I confess, with you, I do not find it very striking. In various languages the name implies this; in Italian, it is *Speronella*, or little spur; in Spanish and German, *Espuela de Caballero*, and *Rittersporn*, both signifying the spur of a knight. The botanical name, *Delphinium*, or *Dolphin*, alludes to an equally fanciful resemblance of the same part—the nectary—to the popular notion of a dolphin's shape."

"Indeed," said Justine, "then that accounts for its other French name, *La Dauphinelle*, or little dauphin. If I had ever thought about the name at all, I had supposed it to have some connexion with the ancient title of Dauphin, bestowed upon the eldest son of the King of France."

"I wonder no Dauphin adopted the *Larkspur* as his badge," observed Lucy; "but this is not the first royal personage for whom I would have chosen an emblem. I remember being astonished that Margaret of Valois should have adopted that of the marigold, when the daisy, the simple cheerful daisy—a plant of the same natural order—which has the same propensity to turn towards the sun—already bore her own name, *La Marguerite*, and would equally well have suited her motto, 'I seek not things below.' Much as I admire the character of that princess, I can never quite reconcile myself to her taste, though I believe it has made me look upon the gaudy marigold with more affection than I should otherwise have done."

"Oh, Lucy!" interposed Mr. Hamilton; "you have not yet forgotten the slight put upon the daisy. I thought of your long discussion of last year when I wrote one of the charades I sent, but I find it has not recalled it to your memory, since your mother has shown it me amongst those yet unproduced. Are you as ready as ever to quote from Chaucer? or have you found yet more endearing epithets for the *Bellis perennis*?"

"Pray, never call my dear daisy by a Latin name," replied Lucy; "I quite join in Aunt Martha's dislike to botanical names, when you apply one to so truly English a flower as the daisy, and am always ready to chime in with the burden of the song in Dryden's poem of 'The Flower and the Leaf,'—'The daisy is so sweet! the daisy is so sweet!' Since you have provoked it, you shall have Chaucer's commendations of it at full length, though I doubt if my cousins have English enough to understand them:—

"Of all the floures in the mede
Than love I most those floures white and rede,
Such that men callen Daisies in our town. . . .
When it upriseth early by the morrow
That blisful sight softeneth my sorrow,

In which me thought I might daie by daie
Dwellen alway the jolly month of May,
Withouten slepe, withouten meat or drinke;
Adown full softly I gan to sinke,
And leaning on my elbow and my side,
The long day I shope me for to abide,
For nothing else, and I shall not lie,
But for to look upon the daisie,
That well by reason men may it call
The emprise and floure of floures all;
I pray to God, that faire mote she fall
And all that loven floures for her sake."

I will not even spare you the description of 'The Faery Queene,' she continued; and again quoted:—

"And she was clad in royall habit greene;
A fret of gold she had next her haire,
And upon that a white crowne she bare,
With floures small, and I shall not lie,
For all the world right as a daisie
I crowned is, with white leaves lite,
So were the floures of her crowne white,
And of a perle fine orientall,
Her white crowne was i'maked all,
For which the white crowne above the greene
Made her like a daisie for to seme,
Considered eke her fret of gold above:—"

"I must confess," said Frederic, "that I cannot quite enter into the beauties of Lucy's quotation, nor was I aware that this flower was so great a favourite with the English poets."

"Oh, yes!" cried Agnes; "Wordsworth calls it 'the poet's darling!'"

"And 'a nun demure,'" said Rosaline.

"A little Cyclops with one eye," added Alleyn.

"A silver shield with boss of gold,
That spreads itself, some fairy hold
In fight to cover;"

quoted Sophia.

"Wordsworth is quite the poet-laureat of the daisy," remarked Mr. Loraine.

"Yet he is not alone in his admiration," said Mrs. Barlow. "Even Laura can repeat some of Montgomery's lines to the same flower. Try, Laura; you need not repeat all the poem, but try to recollect some of it."

And Laura, blushing, repeated—

"There is a flower, a little flower,
With silver crest and golden eye,
That welcomes every changing hour,
And weathers every sky."

Everybody thanked the little girl when she had finished the pretty well-known verses, and agreed that the poet had done justice to his subject; and with so many songs sung in its praise, it might indeed hope for literary immortality, and bear out his assertion, "the daisy never dies."

"If Miss Campbell were here," said Cyril, "I think she would claim for her own Scottish bard some of the honour of crowning it with immortal fame, since nothing can be more beautiful than Burns's address.

"Wee, modest, crimson-tipped flow'r,
Thou'st met me in an evil hour;
For I maun crush amang the stoure
Thy slender stem.
To spare thee now is past my pow'r,
Thou bonnie gem!"

"Yes, yes," exclaimed Lucy, "it must be allowed to be a bonnie gem, the very pearl of flowers—

"The daisie a floure white and rede,
And in French called La bel Margarete.
O commendable floure and most in minde!
O floure and gracious of excellence!
O amiable Margarete! of native kinde—"

Certainly," she ran on, "Margaret of Valois ought to have chosen the daisy for her device. There is something remarkably poetical, Justine, in the French ap-

plication of the same name to the flower and the pearl, both so graceful and so beautifully simple—'First gem of the earth, and first flower of the sea,'—to disarrange one of Moore's lines."

"You have none of you given the derivation of daisy," said Charles, "and I do not believe there will be a better than 'day's eye,'—the eye of day."

"We really must be contented with that, Charles," replied Sophia; "for I do not know of any other. The botanical name comes from the Latin, *bellus*, pretty."

"Indeed," replied Charles, "I think I could find you another for that; but I suppose you will scorn my idea, that it might be traced to the French *belier*, a ram, because the rams, and the sheep, and the pretty bachelors, all nibble at the daisied turf; yet I think it would be a very innocent rustic derivation, and quite as likely to have come in with the Norman conquest, as the French pork for dead pigs, and beef for dead oxen."

All laughed heartily at Charles's new derivation, whilst he maintained that a ram was quite as good a sponsor for a flower as a goat or a hare, a hawk or a dove.

"A dove!" exclaimed Agnes; "pray what flower is called after a dove?"

"Why, the columbine, to be sure," replied Charles. "You, perhaps, fancied it had something to do with your old baby picture-book, where you used to point out

"Harlequin and Columbine,
A-telling of their whole design."

"The columbine," said Sophia, "certainly does derive its name from the Latin word *columba*, the nectary of that flower being supposed to resemble the neck of a dove; and it is singular in combining the eagle with the dove, the soaring emblem of pride, and the gentle emblem of meekness; for its botanical name, *Aquilegia*, comes from aquila, an eagle, there being also a fancied resemblance in part of the flower to the beak of that bird."

"I think, Lucy," said Charles, "that this flower ought to have been emblazoned on the shield of the gallant Lord Rodney, whose motto unites the names of these birds: 'Non generant aquilæ columbas,' proudly boasting that eagles do not breed doves;—though by-the-bye it would be rather a contradiction, since your botanists find them in the same flower, if not in the same nest."

"Pray, mamma, let us hear the charade, in which James Hamilton has alluded to the marigold and Margaret of Valois' motto," asked Lucy; and after a little search amongst her collection, Mrs. Loraine produced the following:—

"Sweetest of female names, my First will bring
To Memory's eye daughters of many a clime—
Her, over whom a halo we must sing,
Too holy to be named in playful rhyme;
And many a scion of a royal race—
Italia's princess, bearing on her brow
The diadem of France—and her, whose grace
And beauty taught each Gallic knee to bow:
When she, that crown resigning, turned and wept
To leave the vine-clad fields, and with her heart
Clinging to those bright scenes, her sad watch kept
On the receding deck, loath to depart,
Though homage waited on bleak Scotia's shore.
And still on Scotia's hills that name we hear,—
Still through her dales the peasant's song will pour
That name which Burns has rendered doubly dear
To all her sons—which, borne by many a maid,
Is loved in many an English cottage home,
And echoed in lone hearts which are betrayed,
By hope to gain my Second, thence to roam.
My Second from the hallowed household hearth
Too oft will lure ambitious youth to stray.
Base dross, extracted from the womb of earth!
How canst thou cheer them from those hearties away?
And yet, if rightly used, a blessing thou,
Diffusing blessings, showering o'er the land
Food for the wretched, teaching hearts to glow
With gratitude, and bless the generous hand

Whose bounty soothes their sorrows. Rich thou art,
Yet far less precious than that pearl of price
Which that fair princess treasured in her heart,
Who fixed upon my *Whole* for her device.
Marguerite of Valois, sure herself a pearl
By name and nature, chose that golden flower,
And 'sought not things below.'—Lo! where unfurl
The banners of the Gospel, to its power
With meek humility behold her bend,
And like that flower, her eye still heavenward send!"

LITERARY NOTICES.

Curiosities of Modern Travel: a Year-Book of Adventure. BOGUE. 1847.

THIS is a selection of some of the most striking incidents to be found in recently published books of travels. There is little in it which is not well known to those who are at all familiar with that description of reading; but to those who have not had the opportunity of reading many larger works of the class, it will no doubt be interesting, as giving a taste of almost every kind of adventure to be encountered in modern travel. We select two specimens:—

THE BURIED TOWN OF PLEURS.

"A spot, which was to me one of the most interesting in all my rambles, was where the village of Pleurs, with about twenty-five hundred inhabitants, was overwhelmed in the year 1618 by the falling of a mountain. This terrific avalanche took place in the night, and was so sudden, complete, and overwhelming, that not only every soul perished, but no trace whatever of the village or of any of the remains of the inhabitants could afterwards be discovered. The mountain must have buried the town to the depth of several hundred feet. Though the all-veiling gentleness of nature has covered both the mountain that stood and that which fell with luxuriant vegetation, and even a forest of chestnuts has grown amidst the wilderness of the rocks, yet the vastness and the wreck of the avalanche are clearly distinguishable. Enormous angular blocks of rocks are strewn and piled in the wildest confusion possible, some of them being at least sixty feet high. The soil has so accumulated in the space of two hundred years, that on the surface of these ruins there are smooth, grassy fields at intervals, and the chestnuts grow everywhere. A few clusters of miserable hamlets, like Indians' or gipsies' wigwags, are also scattered over the grave of the former village, and there is a forlorn-looking chapel that might serve as a convent for handitti. The mountains rise on either side to a great height in most picturesque peaks and outlines, and the valley is filled up with a snowy range at the north.

"It was a solemn thing, to stand upon the tomb of twenty-five hundred beings, all sepulchred alive. No efforts have ever discovered a trace of the inhabitants—not a bone, not a vestige. The mountain that covers them shall be thrown off at the resurrection, but never before. It was the Mount Conto that fell; the half that was left behind still rises abrupt and perpendicular over the mighty grave. It is singular enough that the town was situated itself on the tomb of another village, which had previously been overwhelmed by a similar catastrophe. For that reason it was named Pleurs, The Town of Tears. From the times of old, as often as in Italy one city has been buried, another has been built upon the very same spot, except, indeed, in the case of Pompeii, so that it is no uncommon thing for the same earth to be leased to the dead and the living.

"The Town of Tears was one of the gayest, richest, laughing, pleasure-loving, joyous little cities in the kingdom. It might have been named Tears because it had laughed till it cried. It had palaces and villas of rich gentlemen and nobles; for its lovely and romantic situation, and pleasant air, attracted the wealthy families to spend, especially the summer months, in so de-

lightful a retreat. I wonder that no poet or romance-writer has made this scene the subject of a thrilling story. The day before the lid of their vast sepulchre fell, the people were as happy and secure as those of Pompeii the night of the Vesuvian eruption—and much more innocent. There had been great rains. Vast masses of gravel were loosened from the mountains, and overwhelmed some rich vineyards. The herdsmen came hurrying in to give notice that strange movements had been taking place, with alarming symptoms of some great convulsion; that there were great fissures and rents forming in the mountain, and masses of rock falling, just as the cornice of a building might topple down in fragments before the whole wall tumbles. The cattle were seized with terror, and probably perceiving the trembling of the ground beneath their feet, fled bellowing from the region.

"Nevertheless, there was no dream of what was to follow. The storm cleared brightly away, the sun rose and set on the 4th of September as a bridegroom; the people lay down securely to rest, or pursued their accustomed festivities into the bosom of the night, with the plans for to-morrow; but that night the mountain fell and destroyed them all. At midnight, a great roar was heard far over the country, and a shock felt as of an earthquake, and then a solemn stillness followed; in the morning, a cloud of dust and vapour hung over the valley, and the bed of the Maira was dry. The river had been stopped by the falling of the mountain across its channel, and the town of Pleurs with the village of Celano had disappeared for ever. All the excavations of all the labourers that could be collected failed to discover a single vestige of the inhabitants or of their dwelling-places. The miners could not reach the cathedral for its gold and jewels; and there they lie at rest, churches and palaces, villas and hovels, priests, peasants, and nobles, where neither gold, nor love, nor superstition, nor piety, can raise them from their graves, or have any power over them."—*Cheever's "Pilgrim of the Jungfrau."*

BATHS OF LEUK.

"In coming from the Simplon up the Vallais to Geneva, one passed the baths of Leuk, a little removed from the Rhone. This hamlet, elevated 4500 feet above the level of the sea, is shut in by a circular precipice that surrounds it like a mighty wall, up which you are compelled to climb in steps cut in the face of the solid rock. Its hot springs are visited during the summer months by the French and Swiss for their healing effects. It is something of a task, as one can well imagine, to get an invalid up to these baths. The transportation is entirely by hand, and the terms are regulated by the director of the baths. These regulations are printed in French, and one relating to corpulent persons struck us so comically that we give a translation of it:—

For a person over ten years of age, four porters are necessary; if he is above the ordinary weight, six porters; but if he is of an extraordinary weight, and the commissary judges proper, two others may be added, but never more.

There are some dozen springs in all, the principal one of which, the St. Lawrence, has a temperature of 124 degrees Fahrenheit. The mode of bathing is entirely unique, and makes an American open his eyes at first in unforged astonishment. The patient begins by remaining in the bath the short space of one hour, and goes on increasing the time till he reaches eight hours; four before breakfast and four after dinner. After each bath of four hours' duration, the doctor requires one hour to be passed in bed. This makes in all ten hours per day to the poor patient, leaving him little time for anything else. To obviate the tediousness of soaking alone four hours in a private bath, the patients all bathe together. A large shed divided into four compartments, each capable of holding about eighteen persons, constitutes the principal bath-house. A slight gallery

is built along the partitions dividing the several baths, for visitors to occupy who wish to enjoy the company of their friends, without the inconvenience of lying in the water. This is absolutely necessary, for if eight hours are to be passed in the bath and two in bed, and the person enduring all this is to be left alone in the meantime, the life of an anchorite would be far preferable to it. It is solitary confinement in the penitentiary, with the exception that the cell is a *watery one*. All the bathers, of both sexes and all ages and conditions, are clothed in long woollen mantles, with a tippet around their shoulders, and sit on benches ranged round the bath, under water up to their necks. Stroll into this large bathing-room awhile after dinner, the first thing that meets your eye is some dozen or fifteen heads bobbing up and down, like buoys on the surface of the steaming water. There, wagging backwards and forwards, is the shaven crown of a fat old friar. Close beside, the glossy ringlets of a fair maiden, while between, perhaps, is the moustached face of an invalid officer. In another direction, grey hairs are 'floating on the tide,' and the withered faces of old dames peer 'over the flood.' But to sit and soak a whole day, even in company, is no slight penalty, and so to while away the lazy hours, one is engaged in reading a newspaper, which he holds over his head; another in discussing a bit of toast on a floating table; a third, in keeping a withered nose-peg, like a water-lily, just above the surface, while it is hard to tell which looks most dolorous, the withered flowers or her face. In one corner, two persons are engaged playing chess; and in another, three or four more, with their chins just out of the water, are enjoying a pleasant "tête-à-tête" about the delectability of being under water, seething away at a temperature of nearly 120 degrees, eight hours per day. Persons making their daily calls on their friends are entering and leaving the gallery, or leaning over, engaged in earnest conversation with those below them. Not much etiquette is observed in leave-taking, for if the patient should attempt a bow, he would duck his head under water. Laughable as this may seem, it is nevertheless a grave matter, and no one would submit to it except for health, that boon for which the circle of the world is made, the tortures of amputation endured, and the wealth of the millionaire squandered. The strictest decorum is preserved, and every breach of propriety punished by the worthy burgomaster with a fine of two francs or thirty-seven and a half cents. A set of regulations is hung against the walls specifying the manner in which every patient is to conduct himself or herself. As specimens, we give Articles 7 and 9, which will also be found in Mr. Murray's Guide-book:—

Art. 7. Personne ne peut entrer dans les bains sans être revêtu d'une chemise longue et ample, d'une étoffe grossière, sous peine de deux fr. demande.

Art. 9. La même peine sera encourir par ceux qui n'en entreraient pas, ou n'en sortiraient pas d'une manière décente.

Translation. Art. 7. No one is permitted to enter these baths without being clothed in a long, ample, and thick "chemise," under the penalty of a fine of two francs.

Art. 9. The same penalty will be incurred by those who do not enter or depart in a becoming manner.

"Great care is taken that everything should be done 'decently and in order,' and there is nothing to prevent people from behaving themselves while sitting on benches under water as well as above water."—*Headley's Alps and the Rhine.*"

The Wooden Walls of Old England:—the Lives of celebrated Admirals. By MARGARET FRASER TYLER. 1 vol. Pp. 330. With Frontispiece. Hatchard.

This is one of that numerous class of juvenile works with which the present generation abound, and although no reason is assigned why this volume is necessary, considering the many similar and more en-

larged works of the same character, still its contents are well arranged, written in an agreeable style, and to those of our young friends who wish to peruse the leading events in the lives of Lord Rodney, Earl Howe, Earl St. Vincent, Lord De Saumarez, Lord Collingwood, Sir Sidney Smith, and Lord Exmouth, will form a most acceptable present. They will find much to amuse and a great deal more to instruct.

A NEW ZEALAND CHIEF.

"NENE, or—as he is now more generally known by his baptized name—Thomas Walker (*Tamati Waka*), is the principal chief of the Ngatihao tribe; which, in common with many others, is comprised in the great assemblage of tribes usually called Ngapua. The residence of this celebrated man is near the Wesleyan mission station, on the banks of the river Hokianga; where he fully established his character, as the friend and protector of Europeans, long before the regular colonization of the country. In common with most of his countrymen, Nene was, in his younger days, celebrated for his expertness in acts of petty pilfering; and he himself will now laugh heartily, if reminded of his youthful tricks. On one occasion, when on a visit to one of the missionaries at Waimate, a fine gander attracted his attention, and he secretly ordered it to be seized, and prepared for his dinner in a native oven; but, to prevent detection, the bird was cooked in its feathers. However, it was soon missed, and a rigorous inquiry instituted by its owner, but without success; until certain savoury steams arising from Nene's camp excited suspicion. To tax him with the theft, however, would have been contrary to all the rules of New Zealand etiquette; and the mystery of its disappearance was not unravelled until the morning after he had taken his departure, when the ill-fated gander was found concealed among the bushes: it having been found too tough for even a New Zealander's powers of mastication. Some years after this, a chief of East Cape killed a relation of Nene's; and, according to the customary law in New Zealand of 'blood for blood,' Nene went in a vessel, accompanied by only one attendant, to seek revenge. Landing near the spot where the chief resided, Nene entered his pah, called the murderer by name, and after accusing him of the crime, deliberately levelled his gun and shot him dead at his feet, and then coolly walked away. Though in the midst of his enemies, none dared to touch the avenger: all were paralyzed at his sudden appearance and determined bravery. But Nene is no longer the thoughtless, mischievous New Zealander: for many years he has been playing a nobler part in the great drama of life; and his conduct has deservedly gained for him a lasting reputation. Some traits may be mentioned to his honour. About the year 1839, the body of an European was discovered on the banks of one of the tributary streams of Hokianga, under circumstances which led to the suspicion that he had been murdered by a native called Kete, one of Nene's slaves. A large meeting was convened on the subject, and, the guilt of Kete being established, Nene condemned him to die; the murderer was accordingly taken to a small island in the river called Motiti, and there shot! So rigid were Nene's ideas of justice! When Captain Hobson arrived, and assembled the chiefs at Waitangi, in order to obtain their acquiescence in the sovereignty of the Queen over the islands of New Zealand, the Governor was received with doubt, and his proposals were at first rejected; but when Nene and his friends made their appearance, the aspect of affairs was changed: Nene, by his eloquence and by the wisdom of his counsel, turned the current of feeling, and the dissentients were silenced. In short, Nene stood recognised as the prime agent in effecting the treaty of Waitangi. On another occasion, his intervention was of great service to the British authorities. After the flag-staff at the Bay was

cut down by Heki, Governor Fitzroy proceeded to the disaffected district with a considerable body of military, thinking by a show of force to overawe the rebellious natives. A large concourse of chiefs was gathered together, and many speeches were made; but amongst them all the words of Nene were conspicuous for their energy. 'If,' said he, 'another flag-staff is cut down, I will take up the quarrel,' and nobly has he redeemed his pledge. During the whole course of the rebellion, up to the present period, he has steadily adhered to his purpose, and has on numerous occasions rendered the most essential assistance to the military. He fought in several engagements with the rebels, and each time has proved himself as superior in courage and conduct in the field, as he is in wisdom and sagacity in the council. The settlers in the northern parts of New Zealand are under the greatest obligations to this chief. But for him and his people, many a hearth, at present the scene of peace and happiness, would have been desecrated and defiled with blood; many a family, now occupying their ancient homes, would have been driven away from their abodes, exposed to misery and privation. Those settlers who were living near the disaffected districts, but remote from the influence and out of the reach of the protecting arm of Nene, have been driven as homeless wanderers to seek safety in the town of Auckland; and such would most probably have been the universal fate of the out-settlers but for the courage and loyalty of this brave and noble chief."—*From Angus's Savage Life and Scenes in Australia.*

Poetry.

A TRUE TALE.

By S. M.—.

WHEN, for these feeble days, we paint
The pureness of some parted saint,
Our praise is great—our faith is faint!
We dwellers in the vale below,
Look to the far hills' lucid snow,
Nor dream Man's footsteps there may go.
Not Love, up gazing, and at rest,
Can reach the wonder of that crest,
But toil,—stern, patient, undepreat.
Yet even this deaf and faithless time
Hears some fair cadence of the chime,
Which charmed to prayer its holier prime;
Fragments and trembling echoes, sent
To souls for one brief season lent,
And taken hence while innocent!
For childhood, like the Church's morn,
Of God's free spirit freshly born,
Meets sin with strange and happy scorn;
Eyes, washed by no remorseful tear,
Pure heart, and unpolluted ear,
What we believe, ye see and hear!

With folded hands and drooping head,
A group was gathered round the bed
Where lay a little child, as dead.

A holy child, whose few fair springs,
Shadowed by angel's guardian wings,
Were busied but with heavenly things.

As if the frontal drops had sought
The young heart's inner depth, and wrought
A well to purify each thought.

The watchers hushed each trembling breath,
Bowing "the pride of Life" beneath
The dead "humility of Death."

A sound upon that silence fell
Loved by the little slumberer well—
The music of the vesper bell!

Soft, as the shower from autumn trees,
That drops in no disturbing breeze—
Calm, as the murmur of far seas—

The parting soul that summons knows;
Behold, the small wan lips unclose,
And thence a sudden music flows!

No dying note—no faltering word,
But anthem-strain in triumph poured,
"My soul doth magnify the Lord!"

From first to last, serene and strong,
The child-voice in that holy song
Seemed answering some viewless throng;

And doubt not worshippers were there
Peopling each seeming void of air—
It was the Church's hour of prayer!

Freed was the spirit in that tone!
Ah, weep not friends! Ye might have known
God's mercy must resume its own!

Surely the waiting angel may
Turn from God's face his eyes away,
To look upon that shape of clay,
By Death so softly touched! Serene
And still, as forest shadows seen
At eve upon some level green.

While the child-spirit, hovering nigh,
Beholds, but with how changed an eye!
That calm pale form, the mourners by;

That prison where so late it dwelt,
In sickness wept, in sorrow knelt—
Pain now unknown, and grief unfelt!

While, through faint sob, and tearful rain
(Still most abounding when most vain)
Breaks the far choir's exulting strain,

The Church on earth, whose voice of love
Speeds sweetly her unspotted dove,
Now passing to the Church above,

Winged by her chant—"In peace of heart
O Lord, Thy servant may depart;
Thou his revealed salvation art!"

Words glad, but awful—which condemn
The lips unclean that utter them;
For stainless soul fit requiem!

Miscellaneous.

SWEARING IN COURT.

LORD Ellenborough's interruptions of counsel would sometimes assume a jocular form. When Mr. Park (the late Justice Allan Park,) had been moved in some case that appealed to the feelings to repeated exclamations, and had called heaven to witness, and so forth, while addressing the jury, "Pray, sir," said my Lord, "pray don't swear in that way here in court!" The effect of this interruption, in a grave tone, was irresistible, and Mr. Park heartily joined in laughing at this unexpected practical pleasantry.—*Townsend's Lives of the Judges.*

Abelgitha.

ADELGITHA.

I.
THE Ordeal's fatal trumpet sounded,
And sad pale Adelgitha came;
When forth a valiant champion bounded,
And slew the slanderer of her fame.

II.
She wept, deliver'd from her danger,
But, when he knelt to claim her glove,
"Seek not," she cried, "Oh, gallant stranger!
For hapless Adelgitha's love.

III.
"For he is in a foreign far land,
Whose arms should now have set me free;
And I must wear the willow garland,
For one that's dead or false to me."

IV.
"Nay, say not that his faith is tainted;"
He rais'd his vizor—at the sight
She fell into his arms and fainted;
It was, indeed, her own true knight.—*Campbell.*

A LITTLE TALK ABOUT BUCKINGHAM PALACE.

PERCHANCE the reader is familiar with Vertue's ground-plan of the Palace of Whitehall, or a well-engraved bird's-eye view of that very interesting pile, "as it appeared about the reign of James the First." In either case, he may trace that, at the period above named, in the left distance, might be seen Arlington House, the mansion of Henry Bennet, Earl of Arlington, one of the famous "Cabal." This property was afterwards purchased by John Sheffield, Duke of Buckingham, who obtained an additional grant of land from the Crown, pulled down the old mansion, and, at a short distance from it, built, in 1703, the large red brick edifice subsequently known as Buckingham House. It was in the heavy, yet ornate, style of the time, the house and offices occupying three sides of a quadrangle; the red brick and stone finishings, relieved by figures; on the entablature of the eastern front was inscribed in large gilt Roman capitals, "Sic sita stantur lares;" and the front to the north bore "Rus in urbs;" with sculptural impersonations of the seasons. Pennant describes the mansion as "rebuilt in a most magnificent manner." The duke has left a curiously minute picture of his mode of living at Buckingham House, in a letter to the Duke of Shrewsbury, of which Pennant cunningly says:—"He has omitted his constant visits to the noted gaming-house at Marybone, the place of assemblage of all the infamous sharpers of the time. His Grace always gave them a dinner at the conclusion of the season, and his parting toast was, 'May as many of us as remain unchanged next spring, meet here again.' I remember the facetious Quin telling this story at Bath, within the hearing of the late Lord Chesterfield, when his lordship was surrounded by a crowd of worthies of the same stamp."

The site of the mansion, and the grounds, was formerly the once famous Mulberry Gardens: it must have been a strange retreat. Defoe describes it, in 1714, as "one of the great beauties of London, both by reason of its situation, and its building." At the date of the old print we have spoken of, no buildings extended beyond St. James's, to the left; the north was open to Hampstead, and the view of the Thames almost uninterrupted from the south-west corner of the park.

The Duke of Buckingham died in 1720: his duchess, daughter of James II. by Catherine Sedley, lived here till her death. She was succeeded by the duke's natural son, Charles Herbert (Sheffield), on whom his Grace had entailed the property, after the death of the young duke, who died a minor. It was purchased from Sir Charles by King George the Third; and, subsequently, "Buckingham House, now called the Queen's House," was, by Act of Parliament, settled on Queen Charlotte, in lieu of Somerset House, (settled in 1761 on the Queen Consort, in the event of her surviving the King,) the latter edifice being vested in the King, his heirs, and successors,

"for the purpose of erecting and establishing certain public offices." This purchase was made soon after the birth of the heir apparent to the throne, George Augustus Frederick, at Kew, Aug. 12, 1762. Thenceforth, until her death in 1818, Queen Charlotte resided at Buckingham House, alternately with Windsor and Kew; and nearly all her fourteen children were born here, this being, indeed, the private town residence of the king and queen; whilst St. James's, "said to be the most commodious for royal parade of any in Europe," was used for drawing-rooms, levees, and state ceremonies. The domestic happiness of George the Third and Queen Charlotte at Buckingham House, and their personal superintendence of the early education of their children, must have formed a delightful relief to the courtly splendour of St. James's; whilst this retirement was important to the country; for, it has been well observed of the king, that "the decorum of his private conduct was of much service to him, as well as probably efficacious in no slight degree in giving a higher tone to the public manners, and in making the domestic virtues fashionable even in the circles where they are most apt to be treated with neglect."

We may here mention that the wall of what were called the gardens of Buckingham House, formed one side of the main street of Pimlico: these gardens must, however, have been strangely neglected; for, in 1817, they were described as consisting merely of a gravel walk, shaded by trees, with a spacious and unadorned area in the centre. In size and splendour, Buckingham House was rivalled by Tart Hall, long the depository of the Arundellian marbles: the latter mansion faced the park, on the present site of James-street; its garden wall standing where Stafford-row is now built.

We remember the dull, heavy, facade of Buckingham House in 1825; the mansion itself stripped of its statues and sculptured ornaments, the fountain removed, and the basin in the lawn filled up in the taste that rushed from one extreme to the other—from the over-ornate to the taste which excluded ornament altogether; if we except the four fluted pilasters of the central portion, and the semicircular colonnade connecting it with the two wings, each having pilasters and a pediment, the whole forming three sides of a quadrangle. Mr. Pyne, in his "History of the Royal Residences," has left us a description of the interior, remarkable for its plainness: the King had, however, assembled here a large collection of pictures, and among them many of the works of his pet painter, Benjamin West: for his "Regulus," the King paid one thousand guineas, a liberal commission in those days, but now sometimes paid by our gentry, for a few sittings to a portrait-painter. Of far greater consequence to the country was the collecting of a magnificent library at Buckingham House by George the Third. This collection he bequeathed to the nation, and it is now deposited in a splendid apartment, built for its reception, in the British Museum. The public have, however, derived compara-

tively little benefit from the royal bequest; an administration which but ill accords with the spirit of the sovereign, who was what many influential persons of his time were not—an avowed friend to the diffusion of education, and, certainly, not afraid that his subjects would be made either more difficult to govern, or worse in any other respect, by all classes, from every individual of them, being taught to read and to write.

After the death of Queen Charlotte, Buckingham House continued a solitude of dust and decay: the surviving King lived in unhappy seclusion at Windsor until his death in 1820; and soon afterwards, the royal library was removed, as we have explained. There was little or nothing in the quiet regality of "the Queen's House" to attract the garish taste of the Prince Regent in his decoration of Carlton House; and there was less to tempt George the Fourth, or to reconcile him to his palace in Pall-mall. Pictures, at once costly and portable, were, doubtless, carried off; but the old red brick mansion itself was abandoned for some five years; or, rather, it was left as a sort of "nest egg" for a more ambitious scheme. Dry rot, or, perhaps, satiety on the part of the royal occupant, led to the pulling down of Carlton House. It was then proposed to Parliament to alter Buckingham House, so as to fit it for the residence of the sovereign; the task being confided to Mr. Nash, the architect favoured by George the Fourth, and who had, unquestionably, shown great skill in carrying out the royal taste in the formation and construction of the palatial connexion of the site of Carlton House with Portland-place—now known as Waterloo-place, Regent Circus, Quadrant, and Street. The "alteration" of Buckingham House, by Nash, was commenced in 1825, and was apparently completed by 1828; when the wings were found to require raising, these alterations being estimated to cost 50,000*l.*, and the whole palace, 432,926*l.* The money was, however, grudgingly voted by Parliament, a Committee of the House of Commons expressing its dissatisfaction with such alterations, "not originally contemplated, for the purpose of rectifying a defect which scarcely could have occurred, if a model of the entire edifice had previously been made, and duly examined." A more artistic critic observes: "the wings, when first built, were found too small, and, in consequence, had to be pulled down and enlarged; the attic, from a similar cause, had to be raised, and thus we have lost what would have been the one picturesque feature of the pile, the pediment of the central portico standing out strongly relieved against the story; and, it may also be added, the architect committed such a solecism as to build a dome which he afterwards acknowledged he was not at all aware would be visible from the park."

We suspect this failure in *remodelling* "the Queen's House" was unjustifiably attributed to Mr. Nash, the architect; we believe, with more justice to be ascribed to the king, who repeatedly interposed his royal will and pleasure in matters architectural, until a design reminding one of a house built of court cards was the result. There came out a grand Government project, not for what Lord Bacon calls "a brief model of a princely palace," but for a scheme of cumbrous yet petty magnificence. The proposition was somewhat cunningly linked with the relaying out of the site of Carlton House, and of the enclosure in St. James's Park, to which latter, when disposed as a landscape-garden, the public were to be admitted. Thus, a boon was given to the people with the one hand, and a largish grant for the palace was asked on the other. There followed all sorts of patriotic grumbling at the proposed expenditure, and criticism on the plans, more especially the additional plantations and flower gardens in the palace grounds; and the dug surfaces, the basin, fountains, and lake of several acres. Meteorologists shook their heads, and grave gardeners quoted the fragment of Baconian philosophy: "fountains that sprinkle or spout water, or convey water, as it never stays in the

bowls or the cistern, are a great beauty and refreshment; but pools mar all, and make the garden unwholesome and full of flies and frogs." The great object was to conceal the palace windows from view of the stables and the surrounding houses: and in doing this by the above plan, it was maintained, that, by thickening the marginal belts on both sides of the hollow, to shut out London, Buckingham palace would be rendered a dam to a pond of watery vapour; and that a man must be something less or more than a king to keep his health in that place for any length of time. Then the locality was otherwise beset with nuisances: the smoke of several factories in the newly-built portions of Pimlico, rolled over the palace in huge volumes, and filled its courts: the King is known to have offered many thousand pounds for the removal of an individual nuisance, yet in vain; and, to this day, its fumes continue to float over the nursery of royalty, much to the discomfiture of those who are destined hereafter to sway the sceptre of the British empire.

However, the King came to the nuisance; and there was no royal road for its riddance. The grant of money was obtained, and the "remodelling" was proceeded with; it should, however, be termed *rebuilding*, for we believe the only portion of "the Queen's House" left standing was the ground floor, which accounts for the low-pitched and dark rooms in this portion of the present palace.

George the Fourth did not live to see this pet work completed; though, at about the period that he passed from sublimity suffering, the grand arch—for the especial entrance of the sovereign and the royal family to the palace—was completed. This arch is the greatest work of mere ornament ever attempted in England. It has a centre gateway, and two side openings, and is of the size and general design of the arch of Constantine, at Rome; but is, by no means, so richly embellished, and is altogether a very blank affair compared with the Government design. The sculpture is omitted in the attic; and, in place of the reversed trusses above the columns, were to have been figures of warriors and panels of sculpture intervening; indeed, the fascia was to have been, altogether, far more highly enriched, the attic carried considerably higher, and crowned with an equestrian statue of George the Fourth, flanked with groups of military trophies, vases at the angles, &c. As it is, the sculpture is confined to a pair of figures and a key-stone on each face of the central archway, panels above the side openings, and wreaths at the ends: these are by Flaxman, Westmacott, and Rossi. The statue of George the Fourth was ordered of Sir Francis Chantrey, for 9,000 guineas; the Government put him to the expense of 100*l.* for parchments, and then were two years after the time agreed upon for the first payment! The statue, if we mistake not, is that which has been placed at the north-east angle of Trafalgar square.

We may here complete the description of the arch. The material is white marble, now discoloured by smoke and damp, and in appearance resembling a huge sugar erection in a confectioner's shop window. Upon the attic platform of the arch is a flag-staff, the crown of which is eighty feet from the ground; and from it, during the abode of the sovereign at the palace, the royal standard floats from sunrise to sunset; the silk standard, for state occasions, is thirty feet long, and eighteen feet deep, and cost nearly 200*l.*: it was first hoisted at the coronation of Queen Victoria, June 28, 1838. The gates were not put up until the summer of 1837; the central gates, designed and cast by Samuel Parker, are the largest and most superb in Europe; not excepting those of the Ducal palace, at Venice; or of the Louvre, at Paris: they are of a beautiful alloy, bronzed, the base of which is refined copper. Although cast, their enriched foliage and scroll-work bear all the elaborate finish of the finest chasing; the design consists of six compartments, in each of which is a circle: in the

two upper ones are the lion, *passant gardant*; beneath are the regal G. R.; and lowermost, St. George and the Dragon: the height of each gate is twenty-five feet; width, seventeen feet six inches; extreme thickness, three inches; weight of each, two tons thirteen cwt. They are so beautifully hung that a child might open and shut them. They now terminate at the springing of the arch, but Mr. Parker had cast, for the semi-circular heading, a beautiful frieze, and a design of the royal arms in the central circle, flanked by state crowns; this portion was, however, irretrievably mutilated by the Government removing the gates from the foundry, in a common stage waggon, without due care; yet the work cost, altogether, 3000 guineas. The side openings are filled, meanly enough, with halberds. The central gateway, as first designed, was not sufficiently wide to admit the royal state coach; fortunately the blunder was discovered in time to be remedied. The railings enclosing the court yard, were also cast by Mr. Parker; the spear blades are tipped with Mosaic gold, which have long since been blackened by the canker of a London atmosphere. Nothing can be less effective than this "triumphal" arch: it is cold and blank, unfinished and unmeaning; had it been connected with the palace by a stone arcade or colonnade, the unity would have been improved; as it is, an isolated nonentity is the unsatisfactory result.

(To be continued.)

FRANK FAIRLEIGH;

OR, OLD COMPANIONS IN NEW SCENES.

By F. E. S.

CHAP. XIII.

THE CHALLENGER.

OLD MAURICE the pastry-cook had welcomed his daughter gladly, as one returned from the grave, and had learned from her own lips, with mingled tears of joy and gratitude, how, thanks to noble Harry Oaklands, she had escaped unscathed from the perils and temptations to which she had been exposed. Many days had elapsed, the Long Vacation had commenced, and the ancient town of Cambridge, no longer animated by countless throngs of gownsmen, frowned in its unaccustomed solitude, like some City of the Dead, and still no hostile message came from Wilford. Various reports were circulated concerning the reappearance of Lizzie Maurice, but none of them bore the faintest resemblance to the truth, and to no one had the possibility of Oaklands's interference in the matter occurred, save, as it afterwards appeared, to Charles Archer.

For above a week Wilford was confined to his room, seeing only Wentworth; and it was given out that he had met with a severe fall from his horse, and was ordered to keep perfectly quiet. At the expiration of that period he quitted Cambridge suddenly, leaving no clue to his whereabouts. This strange conduct scarcely excited any surprise amongst the set he moved in, as it was usually his habit to shroud all his proceedings under a veil of secrecy, assumed, as some imagined, for the purpose of enhancing the mysterious and unaccountable influence he delighted to exercise over the minds of men.

Oaklands remained a few days at Cambridge after Wilford's departure, as he said, to pack up, but, as I felt certain, to prevent the possibility of Wilford's imagining that he was anxious in any way to avoid him. Finding at length that his rooms were dismantled, and that he would not in all probability return till the end of the Long Vacation, Harry ceased to trouble his

head any further about the matter, and we set off for Heathfield, accompanied by Archer, whom Harry had invited to pay him a visit.

We found all well at our respective homes; my mother appeared much stronger, and was actually growing quite stout, for her; and Fanny looked so pretty, that I was not surprised at the very particular attentions paid her from the first moment of his introduction by the volatile Archer, (who, by the way, was a regular male flirt,) attentions which I was pleased to perceive she appreciated exactly at their proper value. We soon fell into our old habits again, Oaklands and Archer setting out after breakfast for a stroll or on a fishing expedition, which usually ended in Harry's coming to an anchor under some spreading oak or beech, where he remained "doing a bit of the *dolce*," as Archer called it, till luncheon time; whilst I, who could not afford to be idle, read hard till about three o'clock, and then joined in whatever amusement was the order of the day.

"Frank, may I come in?" exclaimed Fanny's silvery voice outside my study door, one morning during my working hours, when I had been at home about a fortnight.

"To be sure you may, you little torment," replied I; "are you coming to learn mathematics, or to teach me crochet? for I see you are armed with that vicious little hook with which you delight to torture the wool of innocent lambs into strange shapes, for the purpose of providing your friends with innumerable small anomalous absurdities, which they had rather be without."

"No such thing, Mr. Impudence, I never make any article which is not particularly useful as well as ornamental. But Frank, dear," she continued, "I should not have interrupted you, only I want to tell you something—it may be nothing to signify, and yet I cannot help feeling alarmed about it."

"What is it, darling?" said I, putting my arm round her taper little waist, and drawing her towards me.

"Why, Mr. Oaklands has been here this morning; he came to bring mamma a message from Sir John, inviting us all to dine with him to-morrow."

"Nothing very alarming so far," observed I, "go on."

"Mamma said we should be extremely happy, and quitted the room to find a recipe she had promised to the housekeeper at the Hall."

"And you were left alone with Harry,—that was alarming, certainly," said I.

"Nonsense," returned Fanny, while a very becoming blush glowed on her cheek, "how do you do interrupt me! Mr. Oaklands had kindly offered to explain a difficult passage in Dante for me, and I was standing on a chair to get down the book."

"Which he could have reached by merely stretching out his arm, I dare say, only he was too idle," interposed I.

"Indeed he could not," replied Fanny quickly, "for he was sitting in the low easy chair, and trying to fasten mamma's spectacles on Donald's nose." (Donald being a favourite Scotch terrier belonging to Harry, and a great character in his way.) "Well, I had just found the book," she continued, "and we were going to begin, when a note was given to Mr. Oaklands, which had been brought by a groom from the Hall, with a message that the gentleman who had left it was waiting at the inn in the village for an answer. Mr. Oaklands began to read it in his usual quiet way, but no sooner had he thrown his eye over the first few lines, than his cheeks flushed, his brow grew dark, and his face assumed that fearfully stern expression which I have heard you describe, but had never before seen myself. As soon as he had finished reading it, he crushed the paper in his hand, and sprang up, saying hurriedly, 'Is Frank —?' He then took two or three steps towards the door, and I thought he was coming to consult you. Suddenly, however, some new idea seemed to cross his mind, and, stopping abruptly, he strode towards the window, where he remained for some moments, apparently buried in thought. At

length he muttered, 'Yes, that will be better, better in all respects,' and turning on his heel, he was about to quit the room, leaving his hat on the table, when I ventured to hand it to him, saying, 'You are going without your hat, Mr. Oaklands.' He started at the sound of my voice, and, seeming for the first time to recollect that I was in the room, he took the hat from me, begging pardon for his inattention, and adding, 'You must allow me to postpone our Italian lesson till—— I till tomorrow, shall we say? I find there is a gentleman waiting to see me.' He paused as if he wanted to say more, but scarcely knew how to express himself. 'You saw,' he continued, 'that is—you may have observed that—that in fact there was something in that note which annoyed me—you need not say anything about it to Mrs. Fairleigh; she is rather given to alarming herself unnecessarily, I think,' he added with a faint smile; 'tell Frank I shall not be at home till dinner time, but that I shall see him in the evening.' He then shook my hand warmly, and holding it for a moment in his own, fixed his eyes on my face with a strange half-melancholy expression that frightened me, and once more saying 'good bye,' he pressed his hat over his brows, and springing across the lawn, was out of sight in an instant. His manner was so very odd, so unlike what it generally is. Dear Frank, what is the meaning of all this? I am sure there is something going to happen, something."

"You silly child," replied I, affecting a careless composure I was far from feeling, "how you frighten yourself about nothing. Harry probably received a threatening letter from a Cambridge dun, and your lively imagination magnifies it into a—(challenge, I was going to add, but I substituted)—into something dreadful."

"Is that what you really think?" questioned Fanny, fixing her large blue eyes upon my face inquiringly.

I am the worst hand in the world at playing the hypocrite, and with ready tact she perceived at once that I was deceiving her. "Frank," she resumed, "you have seen but little of me since we were children together, and deem, possibly, that I am a weak, silly girl, unfit to be trusted with evil tidings; but indeed, dear brother, you do me injustice; the sorrows we have gone through," (her eyes filled with tears as she spoke,) "and the necessity for exertion in order to save mamma as much as possible, have given me a strength of character, and firmness of purpose, beyond girls of my age in general; tell me the truth, and fear not but that power will be given me to bear it, be it what it may; but, if I think you are trying to hide it from me, (and do not hope to deceive me,—your face proves that you are as much alarmed at what you have heard as I am myself, and probably with far better reason,) I shall be unable to forget it, and it will make me miserable."

"Well then," replied I, "thus far I will trust you; I do fear from what you have told me that Oaklands has received some evil tidings relative to a disagreeable affair in which he was engaged at Cambridge, the results of which are not fully known at present, and which I am afraid may yet occasion him much care and anxiety."

"And I had fancied him so light-hearted and happy," said Fanny, thoughtfully; "and is this all I am to know about it then?"

"All that I feel myself at liberty to tell at present," replied I; "recollect, darling, it is my friend's secret, not my own, or you should hear every thing."

"Then you will tell me all your secrets, if I ask you?" inquired Fanny, archly.

"Whom should I trust, or confide in, if not my own dear little sister?" said I, stroking her golden locks caressingly. "And now," continued I, rising, "I will go and see whether I can do any good in this affair, but when Master Harry is in one of his impetuous moods, he gets quite beyond my management."

"Oh! but you can influence him," exclaimed Fanny, her bright eyes sparkling with animation; "you can

calm his impetuosity with your own quiet good sense and clear judgment,—you can appeal to his high and generous nature,—you can tell him how you love him with more than a brother's love; you can, and will do all this,—will you not, dear Frank?"

"Of course I shall do every thing I can, my dear child," replied I, somewhat astonished at all this sudden outburst; "and now go, and be quiet, this business seems rather to have excited you—if my mother asks for me, tell her I am gone up to the Hall."

"What warm-hearted creatures women are!" thought I, as I ran rather than walked through the park; "that little sister of mine, now—no sooner does she hear that my friend has got into a scrape, of the very nature of which she is ignorant, (a pretty fuss she would be in, if she were to know that it was a duel of which I am afraid!) than she becomes quite excited, and implores me, as if she were pleading for her life, to use my influence with Harry, to prevent his doing something, she has not the most remote notion what. I wish she did not act quite so much from impulse—it's lucky she has got a brother to take care of her, though it does not become me to find fault with her, for it all proceeds from her affection for me; she knows how wretched I should be if any thing were to go wrong with Harry—" and then I fell into a train of thought, as to what it could be which had so suddenly excited him at our house: something connected with Wilford, no doubt, but what? my fears pointed to a challenge, and my blood ran cold at the thought.—He must accept it; neither my influence, were it increased a hundred fold, nor that of any one else could make him apologize; besides it is not very easy to imagine a satisfactory apology for horse-whipping a man till he cannot stand. And what course likely to be of any use could I take? on one point I was resolved—nothing should induce me to become his second. What would be my feelings in case of a fatal result, were I to reflect, that I had made all the arrangements for the murder of the friend I loved best in the world? that I had actually stationed him opposite the never-failing pistol of his most bitter enemy, and placed in his hand a deadly weapon, wherewith to attempt the life of a fellow-creature, when the next moment he might be called upon to answer before the Judge of all mankind for the deeds which he had done in the flesh? No! I could not be his second. As my meditations reached this point, I overtook the groom who had brought the eventful note, and who was leisurely proceeding on foot towards the Hall, with that peculiar gait observable in men who spend much of their time on horseback, which consists of a compromise between walking and riding, and is strongly suggestive of their inability to realize the fact, that they have not at all times and seasons a perpetual and co-existent horse between their legs.

"Have you seen Mr. Oaklands, Harris?" inquired I, as the man touched his hat respectfully.

"Yes, Sir, I may say I've seen him, and that's all," was the reply. "I brought him a note to the cottage, and was waiting for orders, when he came tearing out, desired me to get off, sprang into my saddle, and without stopping for me to let down the stirrups, drove his heels into 'Tom Tra,' (that's the new grey horse, Sir, if you please,) and was out of sight like old boots."

Not having time to institute an inquiry into the amount of velocity with which the ancient articles referred to by Mr. Harris were accustomed to vanish, I asked if he knew who brought the note.

"A groom in a dark claret-coloured livery, mounted on a splendid coal-black mare, nearly thorough-bred, but with more bone and substance about her than you generally see in them sort, and as clean on her pins as an unbroke colt. Sir John aint got such a horse in his stables, nor Mr. Harry neither," was the reply.

This was conclusive evidence; the livery and the mare were alike Wilford's.

Leaving the groom to conjecture what he pleased, I

hurried on, and, reaching the Hall, inquired of the old butler, whether Harry was at home.

"No Sir," was the reply, "they aint any of them at home. Mr Harry came home a horseback, about a quarter of an hour ago, and called Mr Archer into his own room, and they had a confab, and then Mr Archer went out a riding on the same horse Mr Harry came back upon, and would not take any o' the grooms with him—and afore that, Sir John had ordered the phaeton, and, Mr Henry being come home, he asked him to go with him, so you see, Mr Fairleigh, they're none of 'em at home, Sir."

"I'll go into the library, and write a note, Edmonds, said I, as a new idea entered my head, "you know Sir John is kind enough to let me order a horse whenever I like it,—will you tell Harris to have one saddled for me in ten minutes time?"

"Certainly, Mr. Fairleigh, we all of us have Sir John's orders to attend to you, Sir, the same as to Mr Henry, and you're a young gent as it's a pleasure to serve too, if you'll excuse me taking the liberty of telling you so, replied the good old man, as he showed me into the library.

The idea which had come into my head, (and it was more for the sake of doing something that I determined on it, than from any great hope I entertained of its proving of much avail,) was to ride over to Hillingford, and consult Freddy Coleman on the subject. Perhaps his clear head and quick wit might enable him to devise some scheme by which, without betraying Harry's confidence, or bringing the slightest imputation on his honour, this duel might be prevented. What else could I do? It was quite clear to me, that the note Harry had received was a challenge from Wilford, and that the gentleman waiting at the inn was some one whom he had prevailed upon to act as his second, probably Wentworth. Harry's first impulse had evidently been to come to me, and ask me to be his second, but doubtless guessing the distance I should have to the office and reflecting on the difficulties in which if anything serious should ensue, I might be involved, he had determined on asking Archer instead. Archer, by instantly setting off on horseback alone, had clearly agreed to his request, and was gone to make the necessary arrangements, and Harry had gladly accompanied Sir John, in order to be out of the way, and so avoid my questions, and any attempts I might have made to induce him to alter his purpose. Were I to inform Sir John on his return, it would be an unardonable breach of confidence towards Harry. Were I to give notice to the authorities, so as to enable them to take measures for preventing the duel, it would always be said by Wilford, that I did so with Harry's connivance, because he was afraid to meet him: thus my hands were tied in every way and, as I said before, I could think of nothing better to do than riding over to consult Coleman, whose powers of getting out of a scrape I had seen pretty well tested in the affair of the bell ringing. I therefore scribbled a hasty note to my mother, telling her that I was going to take a long ride, and she had better not wait dinner for me—and, leaving a message for Oaklands with the servant who announced the horse, that I should see him in the evening, flung myself into the saddle rode quietly till I was out of sight of the house and then started it a gallop for Hillingford. Unwilling to meet any of the Coleman family, I left my horse at the inn, and, pulling my hat over my brows, to avoid if possible being recognised by their servant, rang the bell, and desired him to tell Mr. Frederic that a gentleman wanted to speak with him.

PISCATOR'S SKETCHES.

CHAP. I.

THE ANGLER.

'When with his lively ray the potent sun
Has pierced the streams, and roused the finny race,
Then issuing, cheerful, to thy sport repair."

THERE are many Piscators, but very few expert anglers. Why? The multitude eschew the angler's occupation, because, to be successful, the angler must confide in skill which, perhaps, is difficult of attainment. Indeed, the angler has many things to study,—the seasons in which certain species of the finny tribes are fit to be taken—the various atmospheric changes—he must wait until the wind shift into the favourable quarter—he must use only this tiny hook, or that delicate line, this species of fly, or that particular bait. And there is also another requirement not less important—we mean *patience*, which ranks as one of the cardinal virtues.

We need hardly perhaps observe too, that a code of honour exists in piscatory as in other pursuits, the use of the rod and line is the only legitimate mode of capturing the denizens of the waters. The sportsman, worthy the name never yet discovered what is called "sport" in the vulgar operation of sweeping the streams with nets, and clearing the deeps, at one swoop, of their inhabitants. Because, independently of the pleasure resulting from rambles by the sides of refreshing streams, the great essential to the gratification of the true sportsman is the successful exercise of his *skill*, in hooking, and in landing, the wary tenant of the deep. It is this which calls him forth from the crowded city, it is this which forms the true zest of his enjoyment.

But how many are the delightful associations of the angler! Why, we hardly ever meet with a true brother of the craft who is not an enthusiastic lover of the beauties of nature. Many have we known famed for their entomological lore, and for their botanical researches. Indeed, the intelligent angler in the clear streams, as they wind their course through the summer meads, is *the man* to recognise and to appreciate the beauties of luxuriant nature, the gay insects which sparkle in the sun, the groups of wild flowers that scatter their fragrance on every side. Nor did we ever know an angler who was not what is termed "a good fellow." For amongst the brethren of the angle a sort of freemasonry exists, they meet, not in the stiff and formal style of steam boat or stage coach acquaintances, but with the frankness and single heartedness of honest Englishmen, and many has been the time, when, at the close of the day's sport, the best parlour of the clean and comfortable village inn has resounded with the song and chorus of some merry band of piscators,—

"— the brimming wave that swam
Through quiet meadows round the mill,
The sleepy pool above the dam,
The pool beneath it never still."

It was in the year 1806, that we were invited by a plain, substantial, and honest yeoman, located in one of the shires, to a piscatory excursion through the grounds he occupied under a good old 'squire of the Sir Roger de Coverley school.

We could not have selected a lovelier morning for our rambles: indeed, a lovelier never dawned upon the world.

The old city in which we dwelt was about six miles from the domicile of our friend. We were up and stirring with the lark. The sun had shown his ruddy disk above the horizon, his golden beams soon irradiated the spires of the old churches, long wreaths of mist were rapidly undergoing the process of evaporation, and disappearing before the balmy breeze which had sprung up from the chimneys of the sweet south.

Our friend, Farmer Mayfield, was a true specimen of the fine old English yeoman—a genuine descendant of the bold yeoman, the prowess of whose name was felt at Cressy and Poitiers. He was what is termed in rustic parlance, “well-to-do.” Blessed with a faithful and industrious helpmate in the person of his worthy dame, he had no other wish to be gratified than to see his daughter, sweet Jessy Mayfield, now just verging upon womanhood, wedded to a worthy helpmate, and prosperous and happy in the world. But our delineation of Farmer Mayfield’s character, and of his domicile, together with our narrative of the vexations he endured at the hands of his ambitious neighbour, Farmer Crabtree, with other matters of village gossip, we shall reserve for a future occasion.

We must here premise, that our sports lead us into a valley through which a clear and broad stream, overshadowed here and there by the drooping foliage of the willow, and occasionally narrowed and obstructed by tall sedge and rushes, meanders on its course like a line of silver, until lost to view in the far distance. It is situated about two miles from a neat little village, sheltered on the north by a chain of well-wooded hills; on the south, a long sweep of landscape rises gradually from the water’s edge, dotted at various points with noble beeches and oaks. Occasionally are seen flocks of sheep browsing in the hedgerows tinged with the hues of the wild briar; kine and oxen, in many a fanciful group, are cropping the herbage in the pleasant pastures. At the upper end of the valley the eye rests upon the old mill, with its overshot wheel, busily plying amidst the splashing and roaring of the troubled waters; the miller all the while with folded arms resting dreamily upon the parapet, and watching the minnows as they play about the eddies of the pool below. The old stone bridge too, built by the members of the religious community centuries ago, when owners of the broad acres around, spans its stream, exhibiting its massive semi-circular arches, and its buttresses indented by the knives of many a rustic. Upon yonder green mound the venerable walls of the old abbey, still noble in decay, shadow forth the greatness of olden times. The moat at its feet, choked with brushwood and brambles, once communicated with the river, where the weir, constructed with fragments from the adjacent perishing walls, dams up the waters, which, forming a broad and silvery veil, fall into the deep pool, and, after foaming and eddying, at length glide along, and mingle with the expanding stream. In the distance are the spire and clerestory of the old village church, rearing their hoary and gothic grandeur amidst the foliage of the tall and stately elms.

Such was the locality of our rambles,—the very embodiment of all that constitutes peace and enjoyment. It was a scene where dwelt many an honest heart under a rough exterior; where the sons of toil went forth with songs to their daily labours: it was a scene as yet untainted with the vices of crowded populations; where the bold yeoman threw open his hospitable doors, and where the good old squire made merry in the hall.

But to our sports. The gentle breeze continues from the south; the stream is rippled, and how it sparkles, save where the fleecy clouds chequer the clear expanse above, and throw their lingering shadows upon the waters!

It is yet an early hour, and we will seek the haunts of the barbel. In the current which rushes from the pool at the foot of the old weir, and winds rapidly on its course through the weeds, until it sweeps the shoulder of that bank of gravel reflected through the limpid stream, we shall find a shoal.

The barbel loves to sport in the sun. See that shoal lurking at the foot of those weeds! The stream is so rapid, one would apprehend the whole would be swept away. No: there they still lie! Now one bold fellow moves, and he shoots forward to the shoulder of the bank; the rest follow in his wake by twos and threes.

How smooth their motions as they glide along! Now they stop to feed at the bottom—see how they root up the sand with their barbs. The barbel is strong and heavy: provide yourself with suitable rod and tackle. Now drop the bait gently into the stream, and be patient, and the odds are you will have sport. There! the float—it all but moves: now it is drawn down gently—very gently; and your heart beats pit-a-pat. Now the float moves with an agility which makes the heart leap in unison; a greedy snatch at the bait, and jerk! jerk!! goes the float beneath the surface. How shadowy and indistinct it becomes—now another jerk! and it disappears altogether. Steady—strike! What a vibration! Let poets talk as they please of the vibrations of the young heart to the impulses of first love,—why, it’s all stuff and nonsense to what the angler feels. See how the rod, strong as it is, bends with the weight! how the well-hooked barbel tugs and plunges at the bottom! Now he becomes wild and frantic, and plunges into mid-water; he bethinks himself suddenly of the deep waters at the weir from whence he strayed on his morning’s excursion; and now he lashes the water with his tail, and rolls over, and down he goes again to seek a safe retreat in his secret haunts. Give him line and let him go: he is strong, and his courage mounts with his danger. Keep him in gentle check—humour him, but not “to the top of his bent,” for depend upon it, if he be permitted to run his nose into those weeds, or into that hole in the bank with which he is so familiar, he will adroitly strike your line with his tail, in which event, good bye to all your hopes of making a capture. How the line still vibrates, as he tugs away at the bottom. How he strikes out right and left, and madly shoots to the surface! There! he makes his last effort—he lashes the water—he turns gently on his side. Quick! get him within your landing net, and you have him safely upon the bank.

What a fine reward for your patience and skill! See how handsome he appears amidst the dewy grass! Mark his form, how symmetrical; his colours too, how fine; his gill-covers and scales tinged with bronze; his head and back greenish brown, shading off to yellowish green on his sides. This is the only moment at which you can appreciate the beauty of such a denizen of the deep.

But now let us prepare for visiting the haunts of the prowling tyrant of the waters; all things favour the prosecution of our sports.

What a melancholy fellow is that full-grown and well-fed pike, who, no doubt, is now lurking in his solitary retreat by the side of yon bulrushes, or at the edge of that cluster of water-lilies; or perchance near the stump of that venerable tree, or under those bushes which overhang the stream! Indulging in his wolf-like habits, how he loves, in quietude, to watch the approach of his prey! With what boldness he shoots out into the clear stream, voraciously to seize upon the truant inhabitants of the waters! He has, perhaps, haunted that spot for the last twenty years. For courage and prowess he has not often met his equal. All is prey to him alike—even his own kind, with whom he is hardly ever known to associate: like a misanthrope he loves to live alone. He has passed through many an adventure. Several times his hardy courage has led him to snap at the troller’s bait, and he has had some narrow escapes. On one occasion he was hooked, and only got away by losing a portion of his lip; on another occasion he was fairly hooked under the left jaw, but, by his prowess, he succeeded in breaking the troller’s line. From these mishaps he has long since recovered. He has, for many years, been the wonder of these waters. Basking in the sun, he has been many a time seen at the surface: he fears no shadows: man for him has no terrors: he will stare you boldly in the face, making no attempts to retreat on your approach, until his keen instinct warns him of absolute danger, when he will shoot off at a tangent, and conceal himself in the depths

beyond the weeds. The whole neighbourhood teems with anecdotes of him; and he has baffled the best fishermen of the district—even the old pensioner, who having returned to these rural scenes to spend the remainder of his days in talking over battles and sieges, has taken to piscatory pursuits under the able tuition of Isaac Walton. Many a fire-side story is told of this old pike,—how he attempted to seize a village maid by the heel, when she one day paddled too far into the stream to wash her Sunday frock; how the nose of Farmer Whitethorn's old mare was bit when Giles Hobnail took her one morning to water; how he once, in winter, made a spring at his prey, but, overshooting his mark, was nearly left floundering on a wide ridge of unbroken ice; how he has always been biting and snapping at the ducks and their brood when crossing the river, pulling some under water, and devouring others. The only successful opponent he ever had amongst the finny tribes, was now and then a solitary perch. It happened one day, that a fine old perch, who had strayed from his companions, had the temerity to go near our hero's hole in quest of a lob-worm which an old crow had dropped from her beak into the stream whilst passing overhead. Our friend, lying close in under the bank, fixed his piercing eyes upon the old perch, anticipating a savoury repast. He quietly calculated the distance, and glided stealthily along: at length he darted, open-mouthed, at his prey; but he met with a reception upon which he had not calculated. The instinct of the perch told him an enemy was near, and he prepared for action: erecting the strong and sharply-pointed spines of the dorsal fin, which he held fixed with his accustomed muscular power, he averted the threatened peril, and thus set the bold tyrant at defiance.

But to our sport. The breeze has freshened and rippled the waters; the sky is fleckered with clouds. That fine plump and lively roach, with his dark green back and silvery sides, will be tempting; we are much mistaken if it do not prove irresistible. The bait drops gently into the stream near the well-known haunts of the old pike. It sinks gradually in the deep water—we raise it slowly to the surface; now we play it by those bulrushes—now under this bush—then under the stump of that old tree. There! a pike has just made his appearance—in piscatory phrase, “we have got a rise.” Now raise the bait higher, until you see it glitter—play it gently down the stream, and then gently upwards. There! he has moved again—he thinks the dead bait a living fish—a bright flash in the water, and he has seized the bait with prodigious force. *Cr-e-e-k-e—cr-e-e-k-e* goes the reel. What music is there in that sound! Away goes the line—the monster has got the bait across his ample jaws, and he breaths the stream. Is it the fine old pike? There—steady—give him line—more line—more still—he is off to his favourite hole. What glorious luck if it be the old pike! There! a minute has elapsed, and again he breaths the strong current. Keep your rod firm—wind up your line—*strike!* How he launches and plunges at the surface! see how he strikes right and left—how his mottled sides flash in the water—how he lashes the element around. He is exhausted! No—he has plunged again with irresistible force; give him line—let him have more play. Now draw him gently towards you again—his efforts to escape grow weaker and weaker—he is close to the edge of the bank. Poor fellow! he falls exhausted on his side; but you must still be careful—there is yet another struggle—he agile and smart in your motions. There! away he goes, head foremost, into your landing-net, and the next moment he is on the greensward.

What a noble fellow! he weighs at least twenty-five pounds—three pounds more than the pike caught by Count D'Orsay last year in Derbyshire. How nature has here again lavished her choicest colouring upon this inhabitant of the deep! Mark his long and graceful form, as he lies at our feet, extending those

ample jaws which exhibit their rows of sharp serrated teeth. But observe his colouring, in particular, how beautiful—the dusky olive green of his back, how gracefully it shades off into mottled white, and green, and yellow, until the eye rests upon a surface like burnished silver.

But what's that? There is a scar on his nose! It is the noble old pike, captured at last.

Such are the pastimes of the angler. His healthful avocation brings him in contact with many beautiful things; Nature's living page lies open before him, and he is introduced to some of her fairest and loveliest scenes.

THE MAIDEN AUNT.

No. III.—CHAP. V.

THURSDAY evening came, and I was not disappointed in Edith's appearance. The splendour of her beauty produced a sensation of which it was scarcely possible that she should be unconscious, and to which perhaps the deep blush which burned on her cheeks and lent double radiance to her eyes, might be attributed. Her brother was in ecstasies, and watched the progress of Lord Vaughan's attentions to her with manifest satisfaction. I was in a boudoir which had been metamorphosed into a conservatory for the evening, making some very small talk about the flowers for Captain Everard—among whose sins of omission, that of never dancing may be reckoned—when Kinnaird approached us. He came evidently to be complimented on his sister's appearance; but he was in too great a hurry to wait for us to begin the subject, so he started with a leading question, cautiously suggestive.

“Edith looks well to-night, does she not?” said he.

I answered, as I felt, very warmly; but his appealing eye passed to Captain Everard, who, as though it had never before occurred to him to inquire whether Miss Kinnaird were ugly or beautiful, made a step forward so as to command a view of the dancing-room, and, after a pause of provokingly quiet consideration, replied—

“Yes; Miss Kinnaird is certainly very handsome.”

“You don't admire that style,” said Frank, scarcely able to conceal his chagrin.

“Indeed I do,” returned Everard, “I admire all styles.”

“The most unsatisfactory answer you could possibly have made!” cried I.

“I am unfortunate,” observed he with a half-smile.

“But here comes a gentleman, whose open raptures are likely to give more satisfaction than my quiet approval. Unhappily you know—or perhaps happily for myself—I am not made of inflammable materials.”

As he spoke, the polka broke up, and Lord Vaughan sauntered into the conservatory with Edith leaning on his arm. They were in animated conversation, and came direct to us, the lady appealing to me with a mixture of playfulness and earnest to induce her partner to restore some flowers which he had stolen from her bouquet, while he on his part was manifestly determined to retain them. I could not make out whether Miss Kinnaird was pleased or annoyed at her companion's broadly-expressed devotion, but she wound up her oration by suddenly turning to Captain Everard, (who had taken no part in the discussion, though Frank and I had interested ourselves in it as in duty bound,) and saying—

“I am only asking for justice. Why do you look so satirical?”

He roused himself to answer the challenge. “If I did look satirical,” said he, “I suppose it was because I was amused at the modesty of your request. You only asked for—justice!”

“Well,” she replied, “and could I ask for less?”

"Could you hope for more?" answered he, "Nay, could even your sanguine imagination hope for so much? I won't say that justice is a rare phenomenon in this world, because that would imply that it is occasionally to be met with."

"And do you mean to say," cried Lord Vaughan, in utter surprise, "that it is never to be met with. Really this is a most extraordinary idea."

"It is not in reality so unwelcome as it seems at first sight," rejoined Everard, quietly. "Justice—which is all Miss Kinnaird asks for, or needs," he added, with a bow, as if the necessity of the compliment had suddenly occurred to him, "would be to many people an object of fear rather than hope."

"And you think no one is ever really just to another," said Edith, thoughtfully, as though she had been pondering his words.

"I do indeed," he replied, "A man feels too much to be really just—a woman, too little."

"Your paradox is for once true," cried Edith with spirit. "A man does always feel his own wrongs very keenly, while a woman is apt to overlook hers, or ready to forgive them."

"Your ingenuity deserves the compliment of submission," answered he, "so I resign my arms."

"You are wise every way," rejoined Edith more gravely than was her wont, "for whether you win or lose, the contest is scarcely suited to a ball-room. So I will leave you to your misanthropy, and try whether it be possible to force a passage into the ice-room."

Lord Vaughan was only too happy to comply with the suggestion contained in her last words, and they moved away. Miss Kinnaird's praise of the ball, on the following morning, was rather more languid than I had expected, but I suppose this might fairly be attributed to fatigue.

Two months have passed since I wrote the last sentence, and I resume my pen to recount the occurrences of the closing week of the period, which has been anything but uneventful. Kinnaird entered the drawing-room where I was at work, and Captain Everard reading in a corner. His countenance was expressive of business, and that not of an agreeable kind; and he addressed me immediately, either overlooking or disregarding his friend's presence.

"I have been walking with Edith, Miss Fordo. Do you know what has happened?"

"I have not seen her since breakfast," cried I. "What is the matter?"

"Why nothing to break one's heart about, certainly," he replied, "but I own I am a good deal disappointed. Lord Vaughan has offered to her."

"And does that disappoint you?" exclaimed I. "I have only been surprised that it has not happened sooner. May I go and wish her joy?"

"As long as you don't wish *him* joy," said Kinnaird, "it matters very little what you say to her. She has refused him."

I could only repeat his words, in profound amazement.

"Yes," he reiterated, "she has refused him point-blank. I can't quite make her out about it; but one thing is very clear, that she is not to be shaken. The marriage would have been so agreeable to me in every way, that I own I had rather set my heart upon it; but her determination was so unhesitating that I could scarcely attempt to dispute it; and you know, to speak common sense, and put romance out of the question, Edith is so young and so pretty that she may very well afford to wait a year or two before she makes her choice."

There was no questioning the truth of this assertion; still he was evidently disappointed, and I could not but sympathise with his feelings. I too had been indulging in anticipations and hopes, and it was not agreeable to have them annihilated when I least expected it. I had fancied that the intimacy between

Edith and her lover was rapidly assuming a tender character on both sides; indeed, the idea that the offer had been already made and accepted, but was for some reason concealed, had more than once occurred to me. I could not understand it, and I did not affect to do so.

"Edith's manner has entirely misled me," said I, "and I fear she has been unintentionally misleading Lord Vaughan. I hope they did not part in bitterness."

"I hope not," was his reply. "She has not a particle of the coquette in her composition, and I conclude that the encouragement which she has unwittingly given arose from her consciousness of her own indifference, and her unconsciousness of any warmer feeling in him. Were she two years older I should fancy that her affections were pre-engaged—but, as it is, that is quite impossible—so it is altogether a mystery."

Nothing more entirely amazes and bewilders a man than the discovery that a woman who is disengaged has refused an unobjectionable offer. It is the greatest trial of faith to which he can be subjected; for it jars with all his preconceived ideas, and stands before him as a fact for which there is actually no place in his system, and in order to account for which the system itself must undergo a radical change. Few, however, are candid enough for this; such occurrences generally form a fresh illustration of the German aphorism, "so much the worse for the facts," and receive a shape or a colour from the mind of the observer which so alters them as to enable him to explain them satisfactorily to himself.

But to return. My short conversation with Captain Kinnaird was succeeded by that grave and awkward silence which commonly occurs between two persons who have the same unpleasant theme to occupy their thoughts, and do not in the least know what to say to each other about it. This was interrupted by Captain Everard, whom we had both forgotten, but who now came forward, and addressed his friend somewhat hurriedly,—

"Kinnaird, have you any commands for London? I am sorry to say I'm obliged to be off on very short notice."

"Obliged to be off!" cried Frank, in astonishment. "Why Everard, are you mad?"

"I don't see any proof of insanity in it," returned Everard, colouring immoderately; "I have letters which—in short, it don't admit of delay—and go I must."

"I hope you have not received bad news, Captain Everard?" said I, civilly.

"No, I thank you," rejoined he,—"only urgent business."

"But Everard!" cried Kinnaird, who was still gazing at him in silent wonder.

"My dear fellow, there's no use in talking about it. I am sorry to be obliged to close my visit so abruptly; but I do assure you—"

"This won't do," interrupted Frank, seizing him by the arm; "scarcely an hour ago you were talking of your plans here for the next six weeks; and, as for your being summoned away by a letter, I wonder you are not ashamed to offer me such an excuse. You know very well there has been no post since the morning. Everard, what does this mean? It is not friendly,—it is not fair. Why do you change colour so? What has happened? Has anything offended you? Have you quarrelled with anybody?"

Captain Everard was absolutely silent, and seemed to be overpowered by an embarrassment as unaccountable as it was unusual. After a moment's pause, Kinnaird proceeded with increased energy.

"I must have an explanation. You have altered your plans since I came into this room. It is not possible that Edith's refusal of Lord Vaughan can have affected you—Everard? Is it possible that Edith—"

He came to a pause here, in the series of beautiful and bewildered questions which he had posed, and so rapidly that he scarcely seemed to comprehend them

himself. Captain Everard, releasing himself from his grasp, answered in a low, quick voice, as he moved away—

"It would have been more generous, Frank, to leave the subject untouched. I expected that your sister's engagement to Lord Vaughan would have been declared: now that I find she has refused him, I feel that I had better go. Let us say no more about it."

"Do you mean to tell me that you love Edith?" cried Frank, following him.

"I have been in constant intercourse with her for more than two months; is not that answer enough?" returned his friend.

"But it is unnecessary for you to speak," he added, proudly, "you cannot be more fully conscious than I am of the impossibility—"

"My dearest Philip!" exclaimed Kinnaird, shaking him by both hands, and well nigh embracing him in his transport; "this is what I wished and hoped; but you were so impracticably cold, that I was forced to give up the idea. Edith and you were made for each other, and I want nothing but your union to make me the happiest fellow alive. What absurd scruple has kept you silent? Don't stare at me, man, as if your senses had taken leave of you! From the first moment you became my friend, my pet vision has been the thought of bringing you and my sister together, if only she should grow up worthy of you; and I rather think you won't deny that the condition is fulfilled. Where is Edith?"

"Frank! Frank!" cried Everard, vainly attempting to detain him as he darted from the room,—

"For heaven's sake, Captain Kinnaird, consider!"—exclaimed I, finding my tongue at last, and running after him in an absolute fever of alarm. But it availed not; he had seen Edith on the lawn, and had joined her before I got farther than the steps of the drawing-room window. I saw him put his arm round her waist, and lead her away. Never was a hapless chaperon more utterly confounded. I returned slowly into the apartment, where I found Everard sitting, his face hidden in his hands,—

"And this," murmured he, as I approached,—speaking, however, to himself, not to me,—“and this is the man I thought shallow-hearted—this the world which—oh, folly and presumption!”

The broken sentences were most expressive, and I stood contemplating him in silence, and involuntarily and unconsciously giving him all my sympathy, and losing sight altogether of propriety, policy, wisdom, my own outraged dignity, and—Owen, who having entered the room unperceived, speedily challenged my attention by saying,—

"Well, Peggy! have you not a word to say to me?"

If a thunderbolt had fallen at my feet—(to use an expression not uncommon in modern novels, the applicability of which I will not pause to discuss)—if a thunderbolt had fallen at my feet, I could not have experienced greater terror or amazement. Scarcely retaining the command of my senses, I turned to him, exclaiming—

"Gracious Heavens! Owen! what has brought you here?"

"An affectionate reception, truly," returned he, apparently a little amazed,—“I am sorry that my sudden apparition should disturb the even tenor of your house-keeping. I told you I would run down for a week or two, if I could; and yesterday I got a put-off from Livingston, to whom I was going for the next fortnight: so, not considering it necessary to stand on much ceremony with you, I put myself into the mail last night—and here I am. One would almost fancy,” added he, lowering his voice, with an expression of dry humour, “that I had interrupted a very interesting tête-à-tête.”

"Of course I am delighted to see you," said I, re-
well as I could from my bewilderment, and
in the Queen's Bench, "only I was so ex-

cessively surprised. Pray allow me to introduce—Captain Everard—Mr. Owen Forde."

Captain Everard had risen from his seat, as soon as he became aware of the entrance of a stranger; he gave Owen bow for bow with due courtesy, but, apparently quite unable to compel himself to the ordinary civilities consequent on an introduction, murmured something about an imaginary appointment, and walked straight out of the room.

"Pray, who may Captain Everard be?" inquired Owen, "and, pray, where is my fair ward?"

"Where, indeed?" thought I. What a pair of questions! I grew desperate, yet was my position so ludicrous that I could almost have laughed. I could not tell Owen what had happened, or rather what was happening, for many reasons—two of which were that I understood it very imperfectly myself, and that I did not know whether Edith would accept or refuse Everard. In the latter case it would certainly be the best policy to say nothing whatever about it. Yet in my heart I felt almost certain that she would accept him—a sudden instinct seemed to have come upon me, and I marvelled at my own previous blindness. Had I answered Owen's two questions with plain sincerity, I might have said,—“Who is Captain Everard?—A penniless soldier! Where is your ward?—In the garden accepting him!” I believe Owen would have screamed! And yet what was I to do? All this while it might be, and probably was, taking place, and nothing could be done to prevent it. Hurriedly reviewing the circumstances of all parties, and trying to conceal my perturbation from Owen's surprised and inquiring eye, I resolved to get rid of him as quickly as possible, and to rush into the garden and obtain an interview with Miss Kinnaird, if possible, before she should see Captain Everard. So I answered my brother as indifferently as I could.

"He is a friend of Captain Kinnaird's, and is now staying with him. But, my dear Owen," ringing the bell, "you must be tired to death, and chilled to an icicle. Light a fire directly in the bay-windowed bedroom," I continued, addressing the servant who obeyed my summons, "get some hot water, and then let luncheon be ready for Mr. Forde. While you are making yourself comfortable, Owen, I will find Edith, and prepare her for the formidable introduction. I think she is walking in the garden."

"With Lord Vaughan, I hope," observed Owen, complacently.

Oh, with what compunction did I call to mind the triumphant letter which I had dispatched to Owen only a week ago, containing a rose-coloured description of Lord Vaughan and his attentions! "I don't know," was my insincere rejoinder, and, as my eyes involuntarily wandered to the window, I fancied I could detect Edith's form in the shrubbery, on the further side of the lawn. Was she alone?

"I hope," continued Owen, lowering his voice to a confidential tone, "I hope, my dear Peggy, that affair is progressing as favourably as when you last wrote. Few things could give me more unmixed satisfaction. I think it quite a case in which a very short engagement might be permitted, and I should not wonder if, instead of troubling Lady Frances with the chaperonage of an unfledged debutante, I shall have to request her to undertake the presentation of a bride—a much pleasanter office, I take it. I shall win the lover's heart by my readiness to shorten his probation, and, between ourselves, I don't know any house that would afford me such good head quarters as his, during my London visit. The experienced Lady Frances herself couldn't have proved a more judicious chaperon than you, my unsophisticated sister. *Je vous en fais mes compliments.* After all, you women have a prodigious advantage over us in that respect—your wit is inborn, and you don't require an apprenticeship to society to teach you how to use it. But what are you stretching your neck, and straining your eyes, at the window for? my dear Peggy, I do be-

lieve you have not heard a word I have been saying. What is the matter?"

No! Miss Kinnaird was *not* alone—and her companion was at least a head taller than Frank! Could I be expected to hear what Owen was saying? He reiterated his query—"What on earth is the matter?"

"Oh nothing," cried I, "I was merely looking for Edith. I perfectly agree with you—nothing can be more judicious."

"Than what?" demanded Owen.

"I really must go for Edith," exclaimed I. "Owen, your luncheon will be ready directly." And out of the room I ran, fairly unable to endure it any longer. As I closed the door, I heard Owen's natural ejaculation, "Very unaccountable, really!"

Almost on the threshold I met Captain Kinnaird, who, taking both my hands, thus greeted me, "Congratulate me, my dear Miss Forde! I'm afraid I didn't manage the matter quite so delicately as I ought to have done—or as it would have been managed, had I left it in your hands—but all's well that ends well, you know, and the end of this is perfect. They are engaged hand and heart! I've just been guilty of the cruelty, however, of breaking up their tête-à-tête, for Edith was a good deal overcome—in fact, altogether—I agitated her excessively—so now I have sent her to her own room to be quiet, and I rather think it will be best if you will be so kind as to go to her."

"But, do you know what you have done, Captain Kinnaird?" answered I; "and what will be the end of it? I have not an idea that Mr. Forde will consent to so unequal a marriage."

"Mr. Forde!"

"Yes; my brother; your sister's guardian."

"I'll be hanged if I ever thought of him for one single moment!" cried the young man, impatiently stamping his foot.

"I dare say not," observed I; "but I assure you he is not a person to be trifled with, and I do not see the slightest hope of obtaining his consent. I am afraid you have involved your sister's happiness very rashly. What is more, very unfortunately, my brother has arrived unexpectedly, and is this moment in the drawing-room!"

He stared in my face in blank discomfiture. I found myself fast losing the tone of rational remonstrance in which I had felt bound to begin the conversation. "I am excessively sorry," said I, answering his looks, for he did not speak a word; "but I really don't see what is to be done. I will go to Edith, and try to prepare her for an interview with her guardian. But I don't see that there is any use in deferring the evil hour; and, if I were you, I would go at once to Mr. Forde, and open the subject."

"Couldn't it be concealed altogether?" suggested he. "She will be of age in three years."

"I cannot countenance any such arrangement," returned I, with unwonted resolution. "Just reflect for a moment on the duplicity which it would involve! your sister would be compelled to imply, if not to utter, a falsehood, ~~ten~~ times a day. The more fondly you love her, the more anxiously ought you to avoid placing her in such a position."

"You are right!" cried he, "and I spoke inconsiderately, as I believe I generally do. Thank you for your advice. I will go to Mr. Forde!" and, ever as rapid in his movements as in his ideas, before I had time to answer, he was in the drawing-room.

I stood still for a moment to collect my thoughts, and then went up stairs to Edith. I found her, as I had expected, in a state of great agitation. She hid her face on my shoulder, wept, and spoke in broken sentences of her happiness and her astonishment. It was presumption in her, she said—with the sweet exaggeration of a woman's love, truer than truth—even to think of one so immeasurably her superior; but her devotion must make up for her defects. At first I could do

nothing but soothe and sympathise; gradually I tried to bring her to the contemplation of possible difficulties; and, at last, with some trepidation, I broke to her the fact of Owen's arrival, and certain disapprobation. It did not produce the effect which I had anticipated. She could scarcely be brought to entertain the idea of Owen as a person to be considered in the matter at all; seemed to regard his consent or refusal with profound indifference; and even, as far as I could gather, appeared to think that three, five, or ten years of delay would interfere but little with her happiness. She was absorbed by one feeling—filled with one idea—namely, that she was beloved; and everything else seemed unreal to her. She heard and understood the words, but they made no impression; there was not room for them in her heart. I verily believe that, had she been told at that moment that she was never to see Everard again, she would scarcely have apprehended it as a misfortune. The consciousness of his love would have seemed to her enough for a lifetime. This, I knew, could not last; but, while it was thus with her, arguments were vain; so, having acquitted my conscience, by informing her of the truth, I did not attempt to stem the tide of her feelings, and had very nearly become as romantic as herself, when a tap at the door recalled me to sublunary affairs.

"Come in!"

"If you please, ma'am, you are wanted in the drawing-room."

The spell was broken; and I went down like a criminal to execution.

BOULDER STONES, OR ERRATIC BLOCKS.

In a former number of this Magazine we have shown that recent investigation and experiment have proved the words of our poet to be literally true,

"The glacier's cold and restless mass,
Moves onwards, day by day,"—

for it has been distinctly shewn, first, that glaciers are usually loaded with parallel heaps of stones, often of great size, and extending along their whole length, called moraines; and also that they move steadily onwards with their rocky burden, which they deposit at the sides or termination of the glacier. Here then we have an agent, gentle yet forcible, capable of conveying blocks of any weight, without subjecting them to the friction and wearing away of angular edges, which would be the inevitable result of such transportation by a stream of water. For the effect of a torrent upon the surface of rocky fragments would be proportioned to its power of bearing them along; and the large boulder stones, of which we have now to speak, being angular, and having no mark of attrition by water, we must by no means class these with such blocks, as testify by their roundness of form, the effect of torrents or sea waves. A glacier thus loaded and passing heavily over the surface of a rock, rubs and polishes the plane over which it is carried, leaving also deep undulating grooves and fine scratches upon the boundary rocks, as well as upon the plane beneath. These effects have been observed in many parts of the world where there are now no glaciers; leading some eminent geologists to suppose that glacial plains must formerly have occupied the tracts which are now strewn with gravel and boulders. Two difficulties lie in the way of this supposition,—first the theory that our earth is gradually cooling, dependent upon the nebular hypothesis;—and next, that the commencement of a glacier is, of course, always below the line of perpetual snow, and that, according to the present elevation of the Alps, the transported rocks lying above Neufchâtel could not have been carried there by its agency. But we have abundant proofs in other parts of the world, that a continual alternation of depression and elevation is going on, and, although we have no means of ascertaining the certainty of the process with respect to the Alps—and subsidence must be always difficult to detect, the movement itself tending to conceal all evidence of it—we may well imagine that it takes place with them as with the Cordilleras of South America, the mountains of Norway, and other gigantic chains. It is more easy to suppose that the

Alps above the Rhine were once much more elevated than they now are, and that a vast glacier, filling the valley through which that river flows, deposited its accumulation of blocks and debris upon the sides of the Jura chain, than that a wave or deluge, however terrific, can have torn these granite masses from their native bed, in the Val Ferret, to the east of Mont Blanc, carried them a distance of seventy miles, and placed them on a "steep, almost precipitous, slope of bare or thinly covered rock," allowing them to retain their angular forms.

It is necessary to notice another theory,—which is, that these boulders were transported by blocks of ice carried along by water, at a time when "it is probable that the proportional area of water in Europe was greater, and certain that the productions of the land and water had a more tropical character, at the same time that the snow line descended lower," than at this day. Professor Esmark proves, that formerly glaciers in Norway descended to a lower altitude than at present; and described a glacier-like dike or moraine in latitude $58^{\circ} 57'$, as lying close to the level of the sea, in a district where are now found only a few heaps of perpetual snow in the hollows of the mountains. French geologists have also shown from the presence of glacier dikes, and from the polished and scratched surfaces of the rocks, that in the Alps enormous bodies of ice formerly descended even to the border of the Lake of Geneva; much below the line of the present lowest descent. The theory that boulders were transported by floating ice supposes that the space between the Jura and the Alps was an arm of the sea, and that the grooves and striae were made by ice blocks. But a body of water sufficient to float such ponderous masses must either have been so many ages in vacating the valley, that these marks (if possible to have been thus made,) would have been obliterated by its continued action, or it must have left its bed in consequence of sudden convulsions, which latter supposition is wholly contradicted by the position of the blocks. A convulsion—one or many—sufficient to convert the valley of the Rhone from an area of the sea to dry or bog land—would not have left the blocks of the Jura poised on almost perpendicular steeps, or on slender pinnacles.

Leaving the Alps, let us cast a rapid glance over Europe, and see what has been done in other countries by our much disputed agent.

The erratic blocks and gravelly diluvium which cover the plain of central Europe, and the steppes of Russia, belong chiefly to the north, and probably owe their origin principally to the Scandinavian mountains: as in many parts of Sweden and Finland long parallel ridges have been observed where there are now no glaciers; while extensive furrows and deep grooves mark the rocks over which they have been transported at the height of 1500 feet above the sea, but never above that altitude. In Russia, boulders are found to which no native place can be assigned in the neighbourhood; in one district, lying upon the top of a ridge 300 feet above the nearest bed of the stone. The block out of which the pedestal for the statue of Peter the Great was formed, in the Isaac square, Petersburg, was a rolled boulder of red Finland granite, found with others in a bog between Petersburg and Cesterbeck. It was diminished by cutting two-thirds away. It has been suggested that this rock must have been transported to the spot where it was found, before the Gulfs of Finland and Bothnia wore their present features; the supposition of an increased temperature in those regions removes the difficulty. Near Öregrund, in Sweden, the rocks on the beach are ground and polished to such a degree, that it is difficult to walk upon them, and large bodies of ice annually descend from the coast.

In Spain, between Salamanca and Fuentes Onores, are terraces 30 feet high on the side of the mountain, lying east and west, and about three miles from one to the other. These plains lie as high above the sea as any of the most elevated parts of Spain and Portugal except the summits of the barrier mountains. These terraces somewhat resemble the parallel roads of Glenroy in Scotland, but unless we had a more definite description, it cannot be decided whether they be more probably the result of the action of water, or of ice.

In Scotland the traces of glacier action are numerous and determinate. The parallel roads of Glenroy, as they are popularly called, require a separate notice. We there lose them for the present, and remark, that upon the rocks in the neighbourhood of Edinburgh are furrows

and scratches which show the agency of ice. Those near Edinburgh are parallel to each other, extending in a line a little north of west and south of east, that is, in the same direction as the valley of the estuary; but, both to the eastward and westward, they deviate from this line by more than half a right angle; and on the south-west part of Scotland they have no uniform direction. In the north of Scotland, near Brora, the hills are marked in parallel lines, north-west and south-east. In Stirlingshire rocks are seen marked by long linear scratches; and having a considerable degree of polish. The furrows and scratches are seen near Edinburgh upon the perpendicular rock; the western face of the hills is chiefly marked, whilst on the opposite side a long bed of diluvium extends, consisting of blue clay, with large erratic boulders imbedded in it. These boulders are also marked with parallel lines, having one direction, which shows that they were held fast whilst drifted across the country, and not rolled over and over like a pebble in a stream.

On the western coast of Scotland we have evidences of contrary action as regards the elevation of the coast and adjoining islands, and, as these are intimately connected with the existence of glaciers in bygone ages, they are worthy our notice.

There is such a continuity of structure through the Isles of Jura, Scarba, and Lunga, that the geological description of one would leave little to add respecting the others. The dip of all is to the east, and the strata are continued through all these islands, showing that probably they were formerly united. The whirlpool of Coryvreckan lies between Jura and Scarba; it is caused by a sunken pyramidal rock, rising with a steep acclivity from the bottom, which is 6000 feet deep, to within ninety feet of the surface; the stream is thus obstructed, and, at a certain state of the tide, breaks with great violence. In the south of Jura and north of Isla are trap veins corresponding with each other; in the sound between these islands is a small green islet, called Glass, consisting of trap rock, and the sea rocks in the vicinity are all of the same material; but there is no great mass of trap in the neighbourhood. There are also fragments of porphyry scattered over Jura, but no veins of it. Isla is distinguished from most of the western islands by the magnitude and depth of diluvium found there; this is not the effect of its streams, which have only ploughed their way through the yielding materials. These lie chiefly facing the south-west, forming a series of banks, in some places sixty feet high.

"Their superficial extent," says McCulloch, "as well as depth, prevents the possibility of their having been formed by any rivers which could have their rise in Isla; and we must therefore rest in the general conclusion, that they appertain to some unknown period, and to some *diluvian* action." Besides *rolled* stones of the quartz, which constitutes the high ridges of Isla and Jura, there are large masses of granite, "a rock not existing in this chain, and of which no transported fragments have occurred among the islands. To inquire whence is useless. If it is said, from Cruachan," (near Ben Voeirich and Loch Katrin) "*the nearest mass of granite*, the extent and intricacy of the present intervening tracts of land offer an insuperable barrier." Doubtless they do so in the present state of the shore and sea; but the dip of these islands gives us a declination in the exact direction of Ben Cruachan; and with the evidences of close geological affinity, it is not very unreasonable to imagine that the granite of the southern shore of Isla may have been transported from the centre of Scotland before the disruption of the islands from the mainland; whether by flood or glacier must be determined by the form of the boulders; though the latter, lying upon the shore and exposed to the action of the waves, have doubtless lost whatever angularity they formerly possessed.

In Arran, the centre of which is granite, there are terraces in the glen through which the Torra runs, in a north-east direction; this alluvium cannot be brought down from a granite mountain by so sluggish a stream; and on the summit of low hills are other alluvia, forming a range on the southern shore, where there are no water-courses to bring them. Near Corry lie granite blocks of enormous size; and others on the shore near Corygilla, in such situations that no possible road can be assigned for their descent from their obvious origin. On Lamlash island is an insulated granite boulder; and there are others on the southern summits of the lower hills which are now separated from the mountains by intricate and deep valleys.

Proceeding northward to Staffa, we there find transported stones, particularly on the abrupt edge of the western cliff; all are of substances not found *in situ* in Staffa, and not nearer than Mull, seven miles distant. McCulloch says, they could have been brought by water, "either gradual or sudden, without supposing Staffa continuous with Mull." The trap strata remain undisturbed, therefore the separation must have taken place by gradual and tranquil action, not by violent dislocation from below. Staffa lies to the south west of Mull; and on the shore of Argyshire, to the north-east, is found a granite boulder 42 feet high by 38 feet; it is supported upon three small stones, one of them granite, the others ironstone. This is at Appin; there are numerous other granite boulders in this part of Scotland.

In Sky the alluvial deposit lying sixty feet above the sea, near Kyleaken, is of the nature of the neighbouring mountains; but intermixed is gneiss, and hornblende schist, which are not found in the island. On the shores of Fladda, the small island in Loch Staffin (Sky) are numerous fragments of red sandstone, with a few of gneiss, both identical with the rocks of the opposite shores of Rasay and Bona. Red sandstone is not found *in situ* in this part of Sky. If the distance of the opposed shores, and the direction of the tide stream, be considered, there is no reason to suppose that the detached stones of Fladda have been washed from Rasay, while there is no communication between the islands which can have occasioned their being brought as ballast.

In Sandy isle, one of the southern islets of the Hebrides, there are numerous blocks of red sandstone. No remains of this are found in strata on the island, but it forms a large portion of the islands of Rum and Sky, lying to the north-east. The following is McCulloch's striking description of the scene.

"The appearance produced by the fallen fragments is very remarkable, and cannot fail to strike a visitor on his first entrance into the valley of Coruisk. The interval between the borders of the lake and the side of Garsven is strewn with them; the whole, of whatever size, lying on the surface in a state of uniform freshness and integrity, unattended by a single plant or atom of soil, as if they had all but recently fallen in a single shower. The mode in which they lie is no less remarkable. The bottom of the valley is covered with rocky eminences, of which the summits are not only bare, but often very narrow, while the declivities are always steep, and sometimes perpendicular. Upon these rocks fragments lie just as on more level ground; and in positions so extraordinary that it is scarcely possible to conceive how they have risen so far after the rebound, or how they have remained balanced on the very verge of a precipice. One weighing about ten tons has become a rocking stone; another, not less than fifty tons, stands on a narrow edge of rock 100 feet higher than that ground below which must have first met it in the descent. Possibly the presence of snow at the time of its fall may assist in explaining this remarkable appearance."

We wonder that the transporting agency of ice did not strike Mr. McCulloch in viewing this scene, as the idea of a rock rebounding from a valley, and then fixing itself upon a rocky pinnacle, could not have been seriously held by him. In our former examples of boulders in the isles of Scotland, we had only the probability of glacier agency; here we have scarcely a possibility of any other. It is evident that a torrent of water could not have left these rocks with their pinnacles and sharp edges uncovered by smaller debris, as they must have been the earliest depositions of the torrent, and a quantity of sand and soil must have been afterwards brought down from the high lands. Also no torrent powerful enough to move such rocks would have left them nicely poised upon the edge of a precipice. No power but that of a glacier could have done this.

We thus see that the granite boulders of the west of Scotland point to the central mountains of that country as their original seat; and we have also seen such evidences of quiet and gradual subsidence among the isles lying the nearest to the coast, as may well lead to the supposition that those mountains also have greatly subsided; and that in remote times they were sufficiently elevated to send forth icy streams laden with their characteristic burdens. In those times perhaps the isles of Jura, &c. formed a part of the mainland, from which they were afterwards gradually and quietly disjoined; we should remember that this quiet disruption or subsidence, of which we have certain proofs, totally denies the possibility of convulsive movements

sufficiently powerful to throw the travelled blocks from Cruachan, or any other mountain of the interior of the country. In England also we see effects which can scarcely be referred to any other agency than that of glaciers; but the evidences of subsidence are less plain. On the continent drifts have been traced in distinct directions, northward from the Alps, and southward from the Scandinavian chain; but in England the course of the transported masses from the mountains of Westmoreland and Cumberland, is chiefly to the south and east, slightly to the north, and not at all to the west; "so that while there is scarcely any appearance of transported gravel on the borders of Scotland, the boulders have crossed the deep and broad vale of the Eden, and have afterwards traversed the Penine hills, over a pass 900 feet above the Eden. This chain must, however, have been in existence, and have acted in some measure as a great natural dam, limiting the eastward distribution of the blocks; for the moving force was sufficient to carry the drift to the south, over all the undulated and hilly region between the mountain border of Yorkshire and Derbyshire, and the Irish sea; the continuity being perfect, at least as far as Bridgewater, more than 150 miles from the origin of the transported matter."

The granite of Shap, in Westmoreland, is so peculiar as to be easily recognised, even in boulders which have travelled nearly across England. There is a block of this granite at Darlington; others at Barton, and in the Tees at Piercebridge, and near Newton; also in the banks of the Seine. Between Embleton and Elwick there is an accumulation of diluvial matter, which begins to rise into elevated ridges; thence ranging about ten miles nearly due north over the centre of the adjacent limestone, these ridges terminate at Wardenlaw Hill, in a capping 200 feet thick, and overlooking all the neighbouring eminences. This transported matter is of granite, and some specimens of which it would be difficult to refer to their native seat.

Near East Bergholt in Suffolk are transported blocks and other diluvial materials. At Stratford St. Mary in the same county, Mr. Clarke says he has "collected specimens of nearly every rock in England, to the north-west of Suffolk." There are beds of marine shells in the eastern cliffs of Norfolk, which show that coast to have been rising; and the same process is taking place in Norway and the north of Sweden, while the most southern part of the latter country, Scania, is subsiding. The island of Saltholm in the Sound, opposite to Copenhagen, is mentioned in the records of the Chapter of Roskilde, in the 13th century, on account of the income which the clergy derived from it; at present it is hardly five feet above the level of the sea, by which it is overflowed almost every autumn, the cattle which graze there in summer taking refuge upon some artificial mounds. It is evident that this island cannot have risen since the above date; it has much more probably subsided, or its revenues could not have been worthy of notice. On the Danish coast of the Sound, six miles northward of Copenhagen, a raised beach occurs about six feet above the level of the sea; and houses have been built between it and the present beach. The island of Bornholm, north-east of Rugen, is also rising, according to calculation, about a foot in a century. It is curious, in connexion with this, that the slight earthquakes which are felt in Sweden almost every year are never experienced in Denmark, and that a shock of an earthquake which, in August, 1829, was felt so strongly on the Danish coast of the Sound that the terrified fishermen in some places left their houses, was not at all perceived on the opposite Swedish shores.

Professor Forbes mentions the appearance of a former glacier, noticed by Mr. Vigne in his travels in Kashmir. At the foot of the Diharah hills between Ghiani and Karohi there are small peaks of limestone, and denuded masses of hardened shingle; and on the plain there lay, with no rock of the kind near it, a large accidental block of limestone. At Dukhun, near Ahmednuggur, boulders cover fields of many acres. They are from 20 to 70 feet high, and as much in diameter; and are piled on each other, fifty or sixty in the compass of two square miles, with not a stone between them. In the neighbouring fields there are no such remains. The Sewalik hills lie at the foot of the Himalahs, with which they are sometimes connected by a chain of low hills, and sometimes separated by valleys from three to ten miles in width. These hills consist of beds of boulders or shingle, of sands hardened

to every degree of consistency, and other substances, the strata dipping generally towards the north. These hills have been mentioned as the remains of glaciers, but it is probable that they owe their formation equally to deposits from the Himalaies by means of other agents than ice.

On the new continent the evidences of former glaciers are in proportion to the other natural characters of that magnificent country. On the shores of Lake Huron lie boulders of rocks not found within the distance of six hundred miles, mostly of granite and porphyry. There is also the same appearance as in Europe, of rock smoothed and furrowed, wherever the drift has come in contact with them. Between the Alleghany mountains and the Atlantic ocean, the diluvium conceals the underlying deposits on the eastern part of this extensive territory, consisting chiefly of fine sand and gravel, but the pebbles even there belong almost entirely to the older rocks of the interior. As we advance from the coast towards the west, the mass of diluvial matter becomes coarser and less sandy; and at length, near the rocky boundary of the plain, the gravel is much coarser, rolled blocks and large boulders occurring, but alternating with clayey beds, sufficiently pure to be used in the manufacture of bricks. Diluvium is also seen west of the Alleghanies, throughout the region of the Ohio and Mississippi, north of Alabama, where not a boulder appears on the face of the land. In Ohio, Kentucky, and Indiana, detached blocks brought from a great distance, and weighing several hundred pounds, rest on the ordinary finer diluvium, and are promiscuously dispersed; the direction of the drift being invariably from the north-west and north.

In Canada the boulder formation is mixed with marine shells, showing, according to Mr. Lyell, "a more arctic climate than now obtains in the neighbourhood." The boulders are of primary rocks occurring at different levels, not resting on each other, but with apparently quiet depositions of clay, gravel, and sand between them, in which the Testacea found there had lived and died. Some of the shells are broken, others have both valves joined as when they lived. "But all idea of these shells, together with the clay, sand, gravel, and boulders having been drifted together into their present position, by a violent current or rush of water, must be given up at once, when I state the fact, that the *Terebratula psittacea*, which are so fragile that the smallest stones would be sufficient to destroy them if carried along, even with a moderate degree of violence, by moving water, are found with their valves together, and their long brittle teeth entire as when they were living. The whole of the facts lead me to infer, that these numerous erratic blocks have been carried by ice, and dropped from time to time on the bed of the tertiary sea."

In South America the boulder formation is extensive and interesting, but would require more space than we can now give to it. Mr. Darwin says, that the agency of ice alone can be applied to the transported blocks, but he concludes that this must have been by icebergs rather than by glaciers. To his interesting volume upon the discoveries which he made in the Southern hemisphere we must refer our readers.

Village Tales from the Black Forest, translated from the German of AUERBACH, by META TAYLOR. Bogue: Fleet-street.

THE interest of these tales depends upon the severe and unadorned truthfulness of their delineations of character, rather than upon variety of incident, the expression of highly wrought feeling, or artificial management of plot. As the name of the author is advancing into considerable notoriety, we think it right to give our readers an example of his style, for which purpose we select, perhaps not the best, but the shortest, and for that reason the most suitable for our pages, of the tales.

THE BROTHERS.

In the thinly inhabited little street, called the "Kaleib," in the village of Nordstetten, stands a

small house, which, beside a stable and a shed, has only three windows, partly patched with paper. At the top garret window hangs a shutter, suspended by a single hinge, and threatening to fall on the heads of the passers-by. Behind the house is a garden which, although small, is divided into two by a hedgerow of withered thorns.

In this house lived two brothers, who had kept up a constant and bitter enmity for fourteen years. As in the garden, so also in the house, everything was divided into two parts, from the garret down to the little cellar. The trap-door was open; but in the cellar below each of the brothers had his own stores, shut off by laths, and locked up. Padlocks were put on all the doors, as if an attack of thieves were hourly expected. The stable belonged to one brother, the shed to the other: not a word was spoken in the house, except an occasional oath, muttered by one of the brothers.

Michael and Conrad (so the brothers were named) were advanced in years, and both were single. Conrad had been married, but his wife had died early; and Michael had always remained a bachelor.

A large old chest was the first cause of this feeling between the brothers. Upon the death of their mother, everything had been divided between them; for their sister, who was married and settled in the village, had already received her portion. Conrad declared he had bought the chest with his own money, which he earned by breaking stones upon the roads. He said that he had only lent it to his mother, and at her death it became his property again. Michael, on the contrary, asserted that, as Conrad had always lived with his mother, and been maintained by her, he could not possess any property of his own. After an angry quarrel between the brothers, the affair was referred to the bailiff, and afterwards to the court at Horb; and it was finally decreed that, as they could not settle the matter amicably, everything in the house, including the chest in dispute, should be sold by auction, and the proceeds shared between them. Even the house itself was put up for sale, but, as no purchaser could be found, the brothers were obliged to keep it.

They had now to repurchase their own goods and chattels, their beds, and other things, by public auction. To Conrad this was a great grief, for he had more feeling than is ordinarily met with. There are in every house many things which possess a value beyond their market price; for thoughts and recollections are attached to them, in which the world at large can have no share. Such things ought to be preserved, and quietly handed down from generation to generation, that their worth may remain unimpaired; for, as soon as they pass into the hands of strangers, their value, as a sacred inheritance, is lost.

Conrad repeatedly shook his head, as these thoughts crossed his mind, when some old piece of household furniture or other was knocked down to him; and when his mother's hymn-book, with its silver clasps and studs, was offered for sale, and a pedlar took it in his hand to weigh the silver, the blood flew to his face, and he bid for the book at any price. At last came the turn for the chest to be sold. Michael hommed aloud, looked at his brother with an air of defiance, and instantly bid a considerable sum. Conrad quickly bid a florin more, without raising his eyes, and all the while counting the buttons on his jacket. But Michael, looking boldly around, bid still higher. No other person advanced more; but out of bravado neither of the brothers would let the other have the thing in dispute: moreover, each thought to himself that he should only have to pay the half, and so went on bidding higher and higher. At length the chest was knocked down to Conrad for eight-and-twenty florins, more than five times its worth.

For the first time Conrad now raised his eyes, and his look was quite altered; he cast a scornful glance at Michael, and, trembling with rage, exclaimed, "When

you die, I'll make you a present of the cheat for a coffin!" These were the last words he spoke to him for fourteen years.

The story of the cheat soon spread through the village, and became the subject of general raillery and jokes. When any one met Conrad, he remarked how shamefully Michael had behaved; and the former worked himself up by degrees into a fury. The two brothers were of very different dispositions, and each pursued his own way in life. Conrad kept a cow, which he used to yoke with his neighbour Christian's cow for field work; whilst in his spare time he broke stones on the roads, for which he was paid sixpence a day. He was very short-sighted, and walked unsteadily; and whenever he struck a spark to light his pipe, he held the tinder close to his nose, to make sure that it was alight; so, throughout the village he went by the name of "Blind Conrandle."

Michael was the very reverse of his brother; he was tall and slim, and walked with a firm step, carrying himself with all the air of a peasant; not that he was one exactly, but it was useful to him in his trade to appear so. He dealt in old horses, and people have a much greater confidence in a horse which they purchase from a fellow in a smock-frock. Michael had once been a farrier, but was unlucky in business; so he either sold or let his fields, gave himself up to horse-dealing, and lived the life of a gentleman. He was a person of great importance throughout the country; for a distance of six or eight miles round he knew the exact state of all the stables, just as well as a statesman knows the statistics of foreign countries, and the position of different cabinets; and, as the latter learns the disposition of the people through the public journals, so Michael sounded the country folks, and got at his information in the public-houses. In every village, too, he had some idle fellow as his resident, with whom he held frequent secret conferences, and who in all cases of need used to despatch an express—in his own person—to Michael, a job for which he merely demanded a bottle of wine. But Michael had also his secret agents, who instigated the stable-lads to acts of revolt; and it generally happened that he had in his shed (which served him for a stable) some jaded old horse, which he tricked out for sale in a new campaign; he coloured the hair over its eyes, filed its teeth, and though the poor beast could no longer eat anything else but bran, what cared he? The next market-day he was sure to get rid of it for more than its worth.

On these occasions he had his peculiar tricks and stratagems; for instance, he used to place some accomplice in the market-place, who would pretend to want to make an exchange; then they would come to high words, and Michael would cry aloud, "I can't exchange; I have neither food nor stall-room, and if I have to sell the horse for a dollar, it can't be helped, go he must." At another time he would play a still deeper trick; for a few pence he got some poor bumpkin to ride the horse up and down the market, as if it were his own, and then said to the bystanders,—“Ah, if a fellow had that horse who knew how to manage him, he would soon bring him into condition, and make a handsome beast of him: his make is perfect; he wants nothing but flesh, and then he would fetch his twenty dollars at the least.”

Then Michael soon found a purchaser, bargained with him for a commission fee, and thus got a double profit by the sale of his own horse. He hated any law transactions, which required a guarantee for soundness; and, when pushed to this extremity, would rather sacrifice a couple of florins than enter into any such engagement; nevertheless, he had often a law-suit on his hands, which ate up the horse together with the profit. Still there was such a charm in this free, roving, and idle life, that, taking the good with the bad, Michael could not resolve to give up horse-dealing. He acted on the principle, “Never go home from market without striking a bar-

gain.” The Jews were also very useful to him, and he in turn played into their hands.

When Michael, on his way to market or return home, saw Conrad breaking stones upon the road, he cast a look at him, half in pity half in scorn, and thought, “Poor devil! breaking stones there from morning to night for sixpence a day, whilst I can earn, even with moderate good luck, six florins.” Conrad, short-sighted as he was, noticed his brother's scornful look, and worked away, banging and splitting the stones till they flew right and left. We shall see, however, which got on best in the world. Michael was a great favourite in the village, for he could go on telling tales from morning till night, and knew all the tricks and ways of the world. Of better things he certainly knew little; for, though he occasionally went to church, he went, as too many do, without giving a thought to what he heard, and without bettering his life.

Conrad too had his faults, foremost amongst which was his enmity to his brother, and the manner in which he showed this. When any one asked him, “How does your brother Michael go on?” he only answered by making a sign with his hand under his chin, as much as to say, “Some day or other he will be hanged!” The folks were of course not sparing in putting this question, and a great shout always followed when they got Conrad to give his usual reply. In other ways, too, the villagers excited the mutual enmity of the brothers, not exactly out of malice, but for idle fun. Michael, however, only shrugged his shoulders contemptuously, when they talked of Conrad as “the poor devil.”

The brothers never remained together in the same room; if they chanced to meet in the village inn, or in their sister's house, one of them instantly hurried away. Nobody thought of a reconciliation between them, and, whenever two men quarrelled, it was a proverbial saying, “They lived like Michael and Conrad.”

At home the brothers spoke not a word, nor did they ever look at one another when they met. Nevertheless, if either of them observed that the other was unwell and kept his bed, he would instantly run to his sister, who lived at some distance, and say to her, “Go up, and see him; I think something is the matter with him.” And on his return home he would move about and work quietly and without noise, so as not to disturb the other. But abroad, and among the neighbours, Michael and Conrad lived in perpetual enmity, and no one imagined that a spark of affection still existed in their hearts.

This state of things continued for fourteen years. Meanwhile, by constantly buying and selling, all the money which Michael gained from the sale of his two fields had slipped through his fingers, he knew not how. But Conrad had bought another field from a neighbour who was about to emigrate, and had paid nearly all the purchase-money. Michael now set up as a kind of agent or adviser to other people in making their bargains, and he calculated that, by the sale of another field, he should bring matters round, and set himself up in business again. “And there arose up a new king in Egypt.” The villagers of Nordstetten might, in a peculiar manner, apply this verse of Exodus to themselves. The old parson was dead; he had been a good man, but had let things go their own way. His successor, on the contrary, was a zealous young man, who was for setting every thing to rights; and certainly he accomplished a good deal. One Sunday, after morning service, the peasants were sitting and chatting together on the timbers which lay near the village pump, and which were intended to build the new engine house. Michael was one of the group; he sat, with his elbows fixed on his knees, looking on the ground and chewing a straw. Little Peter, the son of John the watchman, a boy of five years old, ran past, when one of the villagers called to the child, and said, putting his hand into his pocket, “Hollo, Peter! here's a handful of nuts for you, if you make a face like Conrad. What does Conrad do?” The child shook his head, and was running off; for he was

a sensible little urohin, and was afraid of Michael; but they held him fast, till at last he made the sign of hanging under his chin. At this there was a shout of laughter, that might be heard through the whole village. But, when the boy asked for the nuts, it turned out that the man who had promised them had none; and a fresh shout arose as the boy ran up to the cheat and gave him a kick. Meanwhile the new parson had come down the little hill by the court-house, and stood watching all that passed; but, just as the boy Peter was going to be beaten for his demand of the nuts, the parson stepped quickly up, and snatched the boy away. Instantly all the peasants drew back, and took off their caps. The parson now beckoned to the sexton, who happened to be standing by, to accompany him through the village, and learnt from him the whole story about the enmity of the brothers, and all that we have related above. The following Saturday, as Conrad was breaking stones in the village, he received an invitation to call upon the parson the next morning after service. He stared at the sexton, his pipe went out, and for a minute the stone remained unbroken under his wooden-soled shoe. He could not conceive what was to happen at the parsonage, and would gladly have gone that very instant. The invitation was brought to Michael just as he was "polishing the Sunday boots" of an old horse, for so he called cleaning the hoofs. He was whistling a snatch of a song, but stopped short in the middle, knowing full well the lecture that was in store for him, and glad to have time to prepare a saucy reply, scraps of which he muttered to himself.

On Sunday morning the parson preached a sermon from a verse of the 138d Psalm: "Behold, how good and pleasant it is for brethren to dwell together in unity." He pointed out how all earthly happiness and fortune are as nothing, unless shared and enjoyed with those who have rested with us on the same mother's breast. He showed how those parents can never be happy in this world, nor blest in the next, whose children are estranged from one another by envy, hatred, or malice; he quoted the example of Cain and Abel, and showed how brotherly hate was the first cause of sin. All this, and much more, the parson spoke with a clear and thundering voice, till the people said, one to another, "He'll bring the walls about our ears!" But, alas! it is often easier to move stone walls than the hardened hearts of men. Barbara wept bitterly as she thought of the conduct of her brothers; and, although the parson addressed his remarks to his auditors at large, and urged every one to lay his hand upon his heart, and ask himself whether he had a true affection for his kindred, nevertheless every one present felt sure that he referred to Michael and Conrad.

The two brothers were standing not far from one another; Michael bit his cap, which he held between his teeth, but Conrad stood listening, with open mouth; and once, when their eyes met, the cap fell from Michael's hand, and he stooped down quickly to pick it up.

The psalm tune ended with a soft and peaceful close; but, before the last sounds died away, Michael had left the church, and was standing at the parsonage door. It was still locked, so he went into the garden, and stood for a time beside the bee-hives, watching the busy activity of the little creatures. "They know not what Sunday is!" thought he to himself; "and I, too, have no Sunday in my way of living, for I have no regular day of work." Then, again, he thought, "How many hundred brothers and sisters live together in such a hive, and all work like their parents!" But he did not give way to those thoughts long, and resolved not to let the parson lecture him. As he returned toward the church-yard, the last words of Conrad recurred to his mind, and he involuntarily clenched his fist.

When Michael came out of the garden, he found Conrad and the parson already engaged in eager conversation. The latter, who seemed to have given up

expecting him, rose, and begged him to take a chair; but Michael, pointing to his brother, answered, "With all respect to your Reverence, I cannot sit down in the same room with that man. Your Reverence has not been long in the village, and you know not what a sackful of lies he is—a sneaking, hypocritical fellow." Then, trembling with rage, he continued: "That man is the cause of all my misfortunes; he banished peace from our house, and drove me to take to horse-dealing, and bad ways. Ah!" he exclaimed, darting a fierce look at Conrad, "you prophesied—yes, you—that I should hang myself in a halter; but, mark me, your turn will come first!"

The parson allowed them to vent their rage, only interposing his authority to check any personal violence. He felt sure that, when their long-fostered and secret anger was exhausted, some remains of brotherly love would still be found, and brought to light; but he was in part disappointed.

At length both brothers sat down, speechless, and breathing hard. The parson then addressed them, at first in a gentle tone, disclosing all the hidden recesses of the heart; but it was in vain—they both cast their eyes down upon the floor. He then pictured to them the anguish of their parents in the next world. Conrad sighed, but did not raise his eyes. Then the parson summoned all his power, and with a voice like that of a denouncing prophet, he reminded them how, after death, they would have to appear before the judgment-seat, and there answer fearfully for the sin of brotherly hate. He ended; and there was a silence. Conrad wiped the tears from his eyes with his sleeve; then he rose from his chair, and said, "Michael!"

Michael had not heard that sound for so many years, that he started, and looked up. Conrad stepped nearer, and said, "Michael, forgive me!" The hands of the brothers were in a moment fast locked in one another; and the parson laid his hand upon them to bless the act.

When Michael and Conrad were seen coming down the little hill by the court-house, hand-in-hand, every eye was upon them—not a man but felt a secret joy at his heart. As soon as they reached home, the first thing they did on entering the house was to wrench off every padlock and fastening; and having done so, they went into the garden, and levelled the hedge with the ground; no matter what cabbages were destroyed, all token of their former discord had instantly to be removed. Then they went to their sister's house, and they all ate together at the same table.

In the afternoon the two brothers sat in the church side by side, and each held a corner of their mother's hymn-book in his hand.

From that time forwards their lives were spent happily, in unity of spirit, and in the bonds of peace.

The Village Spring.

LINES TO A BEAUTIFUL SPRING IN A VILLAGE.

Once more, sweet stream ! with slow foot wand'ring near,
 I bless thy milky waters cold and clear.
 Escap'd the flashing of the noontide hours,
 With one fresh garland of Pierian flowers
 (Bre from thy zephyr-haunted brink I turn)
 My languid hand shall wreath thy mossy urn.
 For not through pathless grove, with murmur rude,
 Thou soothest the sad wood-nymph—Solitude :
 For thine unseen in cavern depths to well,
 The hermit-fountain of some dripping cell !
 Pride of the vale ! thy useful streams supply
 The scatter'd cots and peaceful hamlet nigh.
 The elfin tribe, around thy friendly banks,
 With infant uproar and soul-soothing pranks,
 Release'd from school, their little hearts at rest,
 Launch paper navies on thy waveless breast.

The rustic here, at eve, with pensive look,
 Whistling lorn ditties, leans upon his crook,
 Or startling, pauses with hope-mingled dread,
 To list the much-lov'd maid's accustomed tread :
 She, vainly mindful of her dame's command,
 Loiters, the long-fill'd pitcher in her hand.
 Unboastful stream ! thy fount with pebbled falls
 The faded form of past delight recalls,
 What time the morning sun of hope arose,
 And all was joy, save when another's woes
 A transient gloom upon my soul imprest,
 Like passing clouds impictur'd on thy breast.
 Life's current then ran sparkling to the noon,
 Or silv'ry, stole beneath the pensive moon ;
 Ah ! now it works rude brakes and thorns among,
 Or o'er the rough rock bursts and foams along !

Coleridge.

THE CINQUE PORTS.—DOVER.

WE all know that "it is but a step from Dover to Calais," though, if all we hear be true, that "step" is sometimes a doleful and weary one; sufficiently so to call up pathological imaginings in the "sea-sick" mind, of the delights of dusty high roads, and even of those lines

"Where all antipathies to comfort dwell,"

the railroads. Yet, if ancient records speak sooth, our ancestors might, (had they invented steam,) have travelled by railway from London to Paris, if some untoward convulsion in ancient days had not ruthlessly riven our little island from its parent earth; or if the perpetual contests of Neptune's angry hosts of the north and southern oceans had not, by slower degrees, but with equally certain result, worn away the obstacle which opposed their meeting.

For there is an old tradition,—one, too, which has not lacked the support of the learned,—that our little island, which rises so proudly from her surrounding waves—which towers so independently from the bosom of the hoary deep—and which boasts so loftily of her Queenship over the whole earth, was once in truth and reality only an insignificant corner of the continent of Europe; and consequently, that "Master John Bull," of independent fame, was, not metaphorically, but literally, a boy's brother of "Mounseer." But wince not so desperately, John! It was in your nonage; nay, you were hardly even in your cradle: it was when the Aborigines of the earth were nursing mothers of future Goths and Scandinavians; when even Gauls were hid in the womb of futurity; when Franks were an unimaginable mystery, and French "lingo" and English "bulliam" were not. Therefore, John, be appeased: the "smiling plains" of modern France were then rugged enough even for thy fierce tread.

The early annals of ours, as of other countries, are somewhat enveloped in fable, somewhat involved in obscurity; but our imaginations will

easily conceive not merely the probability, but the certainty, of there having been loves, wars, murders, tumults, kings and usurpers innumerable, before there were historians to record, or chroniclers to transmit their names to posterity.

Yet do old chronicles—in some degree legendary, no doubt—carry us back to a period sufficiently early to satisfy all our yearnings after the antiquity of our land:—even to the time when

"—in his younger years
 Vast earthbred Giants woo'd her—"

Even at this period, as ever since, Dover was marked out as the arena of chivalry. Those happily constituted souls who, as a learned writer remarks, "swallow Jeffrey of Monmouth without chewing," may delight in his vivid and minute description of the fearful encounters here of "myghtie and strong Gyants." In these pages it may suffice to remark that Brute, the great grandson of Æneas, in obedience to the decree of an oracle, travelled to accomplish his fortunes somewhere about the time that Eli was judge in Israel. On arriving at our happy island, he found it inhabited by giants, whom he was fated to destroy, and the death of one of the hugest of these, called Gog Magog, by a push over the cliff at Dover, first gave name and fame to the place.

It is to a period later than this, and yet one deeply involved in the mists of obscurity—the reign of Lear, a British king, that Shakspeare has referred that description of one of the cliffs of Dover, which, more than all the histories ever written, has rendered this place familiar to the imaginations of his countrymen.

"How fearful
 And dizzy 'tis, to cast one's eyes so low !
 The crows and choughs, that wing the midway air,
 Show scarce so gross as beetles: Half-way down
 Hangs one that gathers sampshire; dreadful trade!
 Methinks he seems no bigger than his head:
 The fishermen, that walk upon the beach,
 Appear like mice; and yon tall anchoring bark,
 Diminish'd to her cock; her cock, a buoy
 Almost too small for sight: The murthering surge,
 Cannot be heard so high:—I'll look no more;
 Lest my brain turn, and the deficient sight
 Topple down headlong."

This cliff, however, which still bears the name of Shakspeare's Cliff, is supposed from the constant

(1) The exactly corresponding, yet somewhat peculiar form of the Dover and Calais cliffs, the existence of a reef of rocks of similar formation across the strait, and not far beneath the surface of the water, and the probable redemption of Holland, Zealand, and part of Flanders from the sea, are the chief circumstances which have induced some writers to believe that England was once a peninsula, not an island.

abrading of the summit and surface, and the unceasing wearing of the sea at its base, to bear a very different, and a much less imposing, aspect than it did in the time of the poet.

It is yet, however, sufficiently formidable for the unaccustomed foot to approach its verge very carefully, and for the unaccustomed eye to scan but fearfully the depths below; and we rather wonder at, than admire, the nerves of the lady who, the other day, could allow a coast-guardsmen to descend this fearful cliff in search of her parasol, which had escaped from her hand, and scale it again with the rescued ornament.¹ That these brave and adventurous men are accustomed to such exploits in the performance of a preeminent duty, can hardly justify the exposing them to a certain risk for an inadequate cause.

Our readers are probably all aware that this celebrated cliff has been excavated, and that all its gnomes and spirits are put to flight for ever by a railway tunnel through its heart.

Shakespeare's Cliff is situated on the opposite side of the ravine (in which the original town of Dover lay) from that hill which, having from time immemorial borne a fortified erection, is called the Castle Hill. It is hardly necessary to state that the lofty chalk cliffs collocated here give not only a majestic and imposing aspect to Dover, but led doubtless to its original and long continued importance, as offering not merely a natural barrier against hostile attacks, but one which a few additional precautions fendered an almost impregnable safeguard to the rising town, built in the ravine at the edge of the haven, the waters of which flowed much farther inland than they now do; Dover, in common with the other Cinque Ports, having been deserted by the sea, but, more happily placed than they, having been still able to conquer this drawback, and to maintain its maritime importance.

It seems to be pretty well ascertained that it was on the cliffs at Dover the Britons made that formidable display which, probably more than the inaccessibility of the coast (for the natural harbour which led to a commodious haven was there) drove Cæsar from the shore. Succeeding Romans, who in due time achieved what Cæsar had little more than attempted, were so fully aware of the natural capabilities of the place, that they early enlarged, extended, altered, and adapted as a Roman station, the British fortification which they found there, and in which, tradition says, Arviragus the British chief ensconced himself when he refused to pay tribute to Cæsar. The tradition that Cæsar built a tower here is fully disproved, and the first authentic account of any Roman masonry is during the consulship of Publius Scapula, who was ordered to Britain about A.D. 49. Within the fortress then raised was a Pharos, octagonal without and square within, of which a very considerable remnant still exists. Roman baths were subsequently erected in the valley below.

In the second century, the far famed Lucius, a Christian Briton of the highest rank, built a church within the fortress on the cliff. It became desecrated, and was reconsecrated by St. Augustine. By Edbald, the son of Ethelbert, it was transformed into a college for secular canons; but these were afterwards transplanted to St. Martin's in Dover, and the college was razed, though the church still

remained for the use of the garrison. Service was duly performed in it until about the year 1690. The ruins of this church and of the Roman pharos form an object of striking and romantic beauty on the summit of this lofty cliff.

Romance has not failed to scatter her roseate tints around. It is said that the ever famous Arthur spread his "table ronde" within the walls of the castle, in a spacious hall which he built for the purpose, with all suitable offices around; and that the beauteous Guenever had also a bower here of his designing, in which, at a later period, *cheu! cheu!* Henry the Eighth deposited stores when he went to France! And, that the tale may not want a fitting consummation, we are informed that some casks of this wine, being overlooked and become thick with long standing, and some salt hard as adamant from the same cause, were exhibited to our wonder loving grandmothers as part of the stores brought and deposited here by Julius Cæsar.

From its lofty and commanding position, Dover has ever been considered a place of vast importance, and has always been a noted place of defence—as noted, that it is said the piratical and fearless Danes ever avoided it, and made not even an attempt to land there. From the time of Alfred the town seems also to have been one of business, of cheerful activity and successful trade. It ranked as one of the earliest and most important Cinque Ports. Ere the Saxon line of monarchs drew to a close, it had a guild, for the purpose of defence, and the security of the commerce of the Town, and the Gihalla or Guild-hall of the burgesses is mentioned in Domesday Book. Before the time of this survey, however, it had procured its charter of privileges from Edward the Confessor, in whose reign the authority of Godwin, Earl of Kent, Governor of Dover Castle and Guardian of the Ports, seems to have much influenced the destinies of the town.

In speaking of this bold, crafty, ambitious and cruel man, it is hardly easy to divest the occurrences of his life of the fictions wherewith they have been embellished. The legend of his death—being choked at a banquet in the king's presence when attempting to take a false oath—is well known: the circumstances attending his first appearance on the stage of public and political life are hardly less romantic.

It was after a hot battle between the Danes and Anglo-Saxons, in which the latter were worsted, that a chief of Knute's army, having pursued the enemy too eagerly, suddenly found that he was not merely separated from all his comrades, but that he had wandered much farther than he imagined. In attempting to retrace his steps, he wandered still more widely, and found himself on the skirts of one of the dense woods which at that time almost covered the face of the country. Evening was fast closing around, and he saw himself thus benighted, without food or shelter or companion, in the midst of a hostile region. Whilst he looked hither and thither, hoping, yet almost despairing of success, he heard some one whistling a martial air, and, looking in the direction whence the sounds proceeded, ere long he beheld the *vocalist* emerge from one of the glades of the wood, accompanied, or rather preceded, by a numerous herd of swine. By his side stalked a magnificent mastiff, of the breed for which Britain was so famous that they

(1) We learnt the circumstance from the man himself, who had volunteered the task, and seemed to think nothing of it.

had been procured at any price for the amphitheatre at Rome. The herdsman was clad in the rudest garb of his country, a coarse tunic girt round his waist, and scarcely reaching his knees; his legs were bare, but on his feet he had rude brogues, made of the skin of a beast, with the hair turned outwards. His appearance was youthful; he was, as we have said, whistling merrily; and was, withal, so earnestly employed in whittling an oak branch with a rude knife taken from his girdle, that he did not observe the stranger until a low growl from the dog caused him to raise his eyes. The soldier, wishing to reconnoitre his new acquaintance before he accosted him, had drawn within the edge of the wood, but was betrayed by his bright helmet and armour, which sparkled among the branches as the sun glanced on it, and had attracted the notice of the faithful dog.

"Finding longer concealment useless, he advanced and accosted the shepherd, inquiring his name.

"Godun," replied the youth readily, replacing the knife in his girdle, and gazing on the armed stranger with perfect fearlessness, and apparently with much interest.

Encouraged by this, the Dane told the youth the predicament in which he was placed, and offered him liberal rewards to be conducted to Knute's ships.

Godun undertook the office, but refused the remuneration: the stranger was sheltered in his father's hut, and finally conducted safely to the fleet. His guide and preserver having rendered his own return unsafe by his conduct—for to assist an enemy was to forfeit his life—he remained (by previous stipulation) in the Danish camp with his new friend, whose sister he eventually married.

His rise to power, and the importance he obtained in the cabinets of the Danish-English kings, are well known; but it was in the reign of the Confessor that he crowned his assumption and arrogance. We may consistently add here that the fracas which led to open hostilities between him and his king, and to all the "pomp and circumstance" of incipient civil war, and resulted in the banishment and outlawry of himself and his family, and the confiscation of his estates, occurred at Dover, and was caused by Earl Godwin's supporting the interests of the town in a point which ran counter to the wishes of the king. The occurrence is recorded in the Saxon Chronicle, but the details are of no particular interest.

In such great consideration was the Castle of Dover held at this time, that, in the negotiation which William Duke of Normandy is said to have contracted with Harold prior to the death of the Confessor, in which Harold promised to further William's attempt on the crown of England, it is recorded, that the condition on which he placed most stress was, that the Castle of Dover should be at once placed in his hands. In accordance, therefore, with this idea of its importance, we find that, immediately after the victory at Hastings, he hastened thither to take possession of it. It was then deemed impregnable, and numbers of the natives had fled for safety to its walls; but it was soon yielded up to him, and he spent even then, when time was so precious, eight days in examining the fortifications, and in projecting improvements. It was at this time that the "men of Kent," made that demonstration of fearlessness and independence to which we have referred in a preceding sketch.

According to Lord Coke, Dover, with Sandwich and Romney, were the Ports of most especial note before the Conquest, and Dover especially continued to maintain its fame. William, having fortified and well garrisoned the castle, committed it to the keeping of his half brother Odo, whilst he himself repaired to Normandy. From this time, though the port continued to be one of the greatest consequence, being frequently, by royal command, the one at which embarkation and debarkation to and from the Continent was especially enjoined; still its importance as a military station was so very great, that the annals of the port seem to yield to those of the castle; and, as a history of Canterbury is little more than that of the prelates who have held archiepiscopal sway within its storied cloisters, so is that of Dover chiefly merged in the doings of the constables who have held the key of its battered castle. To the chief of these we shall now refer.

The high characteristics which Odo, the first constable after the Conquest, had displayed in a less brilliant position, were lost beneath the temptations with which his princely rank and kingly power (for he was Regent of the Kingdom) overwhelmed him. His cupidity became excessive, from the view, it was said, of purchasing the Papacy. It is said that he caused vast quantities of gold which he amassed to be ground to fine powder, and, stowing it into pots and crocks, sunk them for concealment in various marked spots in the beds of different rivers. He had also accumulations of treasure, money, jewels, plate, and various riches, confided to the care of different religious houses, which were afterwards yielded up to the King. He procured to himself 184 lordships in Kent, and 445 in different counties; and, at length, restrained by no principle either of justice or religion, he plundered a cathedral church at Durham, carrying away, amongst other spoils, a valuable crucifix of sapphire.

It may readily be imagined, that in such unscrupulous appropriations all feelings of honour and justice were soon discarded; but, worse still, in his eager cupidity his heart became hardened; he showed no mercy in his exactions, and became abhorrent in his cruelties. The "men of Kent" rose against him, and under the guidance of the Count of Boulogne, made an attempt to surprise the castle, which was, however, unsuccessful. But his career of extortion had drawn to a close; and at the very time when, all being achieved according to his wishes, he was in the act of escaping from the kingdom, the King (well informed of all his proceedings) accidentally encountered him. The old chroniclers thus describe the scene. The King himself sprung forward and seized him, shouting,

"I arrest thee, I arrest thee."

"You do me wrong," said Odo, "I am a bishop and bear crozier, and you ought not to lay hand on me."

"By my head," quoth the King, "but I ought; I will seize the Earl of Kent, my bailiff and steward, who has not accounted to me for my kingdom that he has held."

He was consigned to a prison at Rouen, whence he was not released till the death of the Conqueror.

The unremitting attention paid by William to the fortifications of the castle, and also to the defence of the town of Dover, are abundant testimony of the high ideas he entertained of its importance, even after, by his general and minute survey recorded in the Domesday-book, he had gained a

complete knowledge of the resources of his kingdom. He built a wall for defence of the town, studded at intervals with towers of defence, and intersected with ten gates. This wall, it is said, had been commenced by the Romans. There were very rigid duties of nightly watch and ward enforced for the safety of the town; and still more for the furtherance of this object—buildings being then chiefly of wood, and conflagrations frequent—each housekeeper, under a fine of twenty pence, was constrained to place a tub full of water nightly before his door. The town of Dover had already been nearly consumed by fire.

After the expulsion of Odo, William appointed John de Pies, a Norman of high rank and of the noblest character—for it is said "he died respected by the King, beloved by the people, and lamented by both"—Constable of Dover Castle, and Warden of the Cinque Ports, and entailed those high offices on his posterity. The King awarded to him upwards of one hundred and seventy knight's fees in land, in order that he might efficiently provide for the security of Dover Castle. The constable acted liberally and honourably. He immediately distributed the greatest part of this grant to eight other knights, whom he associated with himself; and a system of defence in turn was arranged, by which the castle was at all times manned and guarded by themselves and their followers. It was then that the castle and fortifications began to assume the outward appearance which we are almost, from habit, inclined to suppose was always their characteristic. Each of these associated knights undertook to build a tower and a specified portion of connecting wall; and some of these towers go even now by the names of the original founders. The constable, assisted by the King, built a new gateway, with hall, embattled gallery, and all other apartments suitable for a feudal baron of the time. The Saxons had always adopted low gateways and contracted passages, as a means of defence; but now, for the first time in England, the castle was entered through a lofty and spacious arch, secured with drawbridge, portcullis, and massy gates. The architect was of that body, to whom alone we can in those times look for aught elevated above the usual habitudes of rude military life. This great improvement was planned by Gundulph, Bishop of Rochester; and when, far on to a century afterwards (1153), the foundation of the keep was laid—that same keep which, altered, patched, and repaired, we still see—the architect adopted the plan which had been suggested by this prelate in William the Norman's time.

From this period, Dover was not only the chief ornament of the country, and the place where her chivalry assembled prior to any warlike expedition abroad, but its port became the usual passage to and from England, not only for English nobility, but for foreign potentates; and there was an old statute, repealed only in James's time, that none should take shipping for Calais but at Dover.

Perhaps her cliffs never re-echoed more martial sounds, her strand never witnessed a finer assemblage of chivalry, than that assembled here to accompany the King of the Lion-heart to the Holy Land.

FRANK FAIRLEIGH:

OR, OLD COMPANION IN NEW DRESS.

By F. E. S.

CHAP. XIV.

COMING EVENTS CAST THEIR SHADOWS BEFORE.

"FREDDY, can I have half an hour's private conversation with you?" asked I, as soon as we had exchanged salutations.

"To be sure you can; but," he added, catching a glimpse of the anxious expression of my face, "there is nothing wrong, is there?"

I made a gesture indicative of silence, and he opened a door into a sort of lawyer's office, saying in a low voice—

"Come in here, we shall not be interrupted; the governor's in town, and the women are out walking."

"So much the better," replied I, "for the business I am come upon is strictly private, and will not brook delay."

I then told him as concisely as possible the whole affair from beginning to end; he listened attentively to my recital, merely asking a question now and then, to elucidate any particular point he did not clearly understand. I fancied he made a gesture of surprise when I first mentioned Wilford's name, and when I had concluded, he asked,

"Wilford, you say, this man's name is? What is his Christian name?"

"Stephen."

"And he's a young fellow?"

"About three or four and twenty."

"And you want to prevent his being able to shoot Harry Oaklands at five o'clock to-morrow morning?"

"I do not know the hour, but I conclude the meeting will probably take place to-morrow morning. Wilford would not want to remain in the neighbourhood longer than necessary, lest he should attract attention."

Coleman mused for some minutes, and then muttering, as though he were thinking aloud—

"It might be done so; yes, that would do. I suppose," he said at length, "if Master Wilford were taken into custody on a magistrate's warrant at half-past four a.m., that would suit your ideas very nicely. I can so arrange the matter that Wilford will never be able to trace the laying the information to our door."

"But how can you avoid that?" inquired I.

"Why, if you must know," replied Freddy, "I am acquainted with a man, who would give a hundred pounds any day to stop our friend Wilford from fighting a duel."

"What, do you know him, then?" asked I.

"Ray-ther," was the reply, accompanied by a very significant wink—"just a *very few*,—I should say we're not entirely strangers, though I have never enjoyed the honour of much personal intercourse with him; but I do not so deeply regret that, as from your account, it seems rather a dangerous privilege."

"But how in the world do you know anything about him?"

"Oh! it's a long story, but the chief points of it are these:—The aforesaid Mr. Wilford, if he can continue to exist till he is five and twenty, comes into £1,000 a-year; but, if we don't interfere, and Harry Oaklands has the luck to pink him to-morrow morning, away it all goes to the next heir. Wilford is now three and twenty, and the trustees make him a liberal allowance of £500 per annum, on the strength of which he spends between 2,000*l.* and 3,000*l.*: of course, in order to do this, he has to raise money on his expectancies. About two months ago he wanted to sell the contingent reversion of a large estate in Yorkshire, from which the greater part of his

future income is to be derived; and a client of ours thought of buying it—ergo, we were set to work upon the matter: whilst we were investigating his right, title, and all that sort of thing, lo and behold! a heavy claim, amounting to some thousands, is made upon the property,—by whom, do you think, of all people in the world!—none other than our old acquaintance, Richard Cumberland!

"Good heavens!" exclaimed I, "how strange!"

"Cumberland," continued Freddy, "has become somehow connected with a lot of bill-brokers, low stock-jobbers,—in fact, a very shady set of people, with whom, however, in our profession, we cannot avoid being brought sometimes into contact; he appears, indeed, himself to be a sort of cross between black-leg and money-lender, improved by a considerable dash of the gambler, and presenting altogether a very choice specimen of the thorough and complete blackguard. Somehow or other he contrives to have cash at command, and instead of being pigeoned, has now taken to pigeoning others; in fact, I fancy he does a very pretty stroke of business in that line. He is a good deal improved in manner and appearance since you remember him; and, among people who don't know him very intimately, he affects the man about town: in short, he is quite at the top of his profession. Wilford became acquainted with him at one of the Newmarket meetings, lost money to him, borrowed money of him, giving him as security a charge upon the estate of double the amount,—ergo, don't you see, if Wilford should by any chance get his quetous from Harry's pistol, he won't live to come into his property, in which case Master Dicky Cumberland is minus some thousands. So if I contrive to give him a hint, depend upon it he stops the duel. I will caution him not to let my name appear,—he will not hear yours; so in this way I think we may manage the affair, and defy the old gentleman himself, though he's a very cunning lawyer, to trace it to us."

"Well," said I, "as I see no other means of saving Oaklands's life,—for this Wilford is a noted duellist, and no doubt thirsts to wash out the insult he has received in blood,—I suppose we must do it; but it is an underhand proceeding which I do not at all like."

"There you are, with your chivalric, high-flown, romantic notions; you would stand coolly by, and see the best friend you have in the world butchered before your eyes, rather than avail yourself of a splendid chance of saving him which Fortune has thrown in your way, because, forsooth, it involves a little innocent manoeuvring!—for Heaven's sake, my dear boy, get off your stilts, and give common sense fair play."

"I can only repeat what I have just said," replied I, "I will do it, because I believe it is the only thing to save Harry, but I do not like it, and never shall."

"I cry you mercy, Signor Francisco de Fairleigh, the veritable Don Quixote of the nineteenth century," laughed Freddy; "and now, most chivalrous Sir, where do you imagine it probable that this evil faiseur, this man of powder and pistols hangs out?"

"He is most likely at the inn at Carsley, a village on the London road, about four miles from us," replied I, "I don't know of any other place in the neighbourhood where he could be lodged; but I'll tell you what I'll do;—the name of the inn is the White Horse,—if I should prove wrong in fancying that he is there, I will send a message to that inn to say where he may be found."

"Exactly," returned Freddy, entering the White Horse, Carsley, in his tablets; "now I think I know all about it; and it shall not be my fault if this duel comes off to-morrow morning. Good bye, old fellow! I wish you did not look quite so grumpy about it, but it's all those medieval prejudices of yours. I dare say you'd think it a much more manly way of stopping the business, to electotype yourself in brass and steel, throw yourself across a cart-horse plated to match, and shouting, 'Fairleigh to the rescue!' run a long pole pointed with iron through Wilford's jugular. Now I

consider mine much the most philosophical way of doing the trick; in fact, conducting a dodge of this kind always affords me intense satisfaction, and puts me into the highest possible spirits. Have you ever seen the war dance in which the Hottentots—from the wash-ki Indians usually indulge before they set out on an expedition? A quarter to three," he continued, pulling out his watch, "the coach to London passes in five minutes, I shan't have time to show it you, but it begins so." Thus saying, he flung himself into a perfectly indescribable attitude, and commenced a series of evolutions, more nearly resembling the contortions of a dancing bear, than any other Terpsichorean exhibition with which I was acquainted. Having continued this until he became very unnecessarily hot, he wound up the performance by flinging a summerset, in doing which he overturned the coal-scuttle into a box of deeds, whereby becoming embarrassed, he experienced much difficulty in getting himself right end upwards again. "There," he exclaimed, throwing himself into an arm-chair, commonly occupied by his father's portly form—"There! talk of accomplishments,—show me a fashionable young lady who can do that, and I'll say she is accomplished. It's rather warm work, though," he continued, wiping his brow, "unless one wears the appropriate costume, which, I believe, consists of a judicious mixture of red and yellow paint, three feathers, and the scalp of your opposite neighbour. Pleasant that," he added, pointing to the reversed coal-scuttle—"that's a new edition, not of 'Coke upon Littleton,' but of Coal upon—what's the suit? aye, Buffer versus Stoker. I shall have to make out a case of circumstantial evidence against the cat, or I'm safe for a rowing from the governor. Good bye, old boy! don't fancy I'm mad; I'm not the fool I seem, though I confess appearances are against me just at present; there's the coach, by Jingo, three bays and a grey,—no chance of the box—is this a hat off we go." So saying, he shook my hand warmly, bounded down the steps, and the next moment was rattling away towards London as fast as four horses could hurry him.

It was with a heavy heart, and a foreboding of coming evil, that I mounted my horse and slowly retraced my steps towards Heathfield. Coleman's exuberant spirits, which I believe were partly assumed with a view to cheer me by diverting my attention from the painful subject which engrossed it, had produced an effect diametrically opposite to that which he had intended, and I felt dissatisfied with the step I had taken, doubtful of the success of his mission, anxious to a degree which was absolutely painful about the fate of Harry, and altogether thoroughly miserable. I reached home in time for dinner, during which meal my abstracted manner and low spirits were so apparent, as to set my mother speculating on the chances of my having over-heated myself and "got a chill," whilst Fanny's anxious questioning glances, to which I was well aware I could furnish no satisfactory reply, produced in me a degree of nervous excitement which was unbearable, and, the moment the cloth was withdrawn, I left the room, and rambled forth into the wildest parts of the park. The quiet peaceful beauty of the scene, and the refreshing coolness of the evening air, had in a great measure calmed the excitement under which I laboured, and I was turning my steps towards the Hall, when I met Oaklands and Archer, who, finding I was not at the cottage, had come in search of me. Half an hour's conversation served to render all my previous conjectures matters of certainty. The challenge had been given and accepted, Wentworth was to be Wilford's second, and he and his principal were staying at the inn at Carsley.

The spot chosen for the scene of action was a plot of grass-land situated about half way between Carsley and Heathfield, so as to be equally accessible to both parties; the time appointed was five o'clock the following morning. Archer was to act as Oaklands's second; everything had been managed with the greatest

caution, and they did not believe a single creature, excepting themselves, had the slightest suspicion that such an event was likely to take place. They had resolved not to tell me till every thing was settled, as they feared my opposition. Having thus taken me into their confidence, Archer left us, saying, that "probably Oaklands might like to have some private conversation with me, and he would join us again in half an hour." Rejoiced at this opportunity, I used every argument I could think of to induce Harry not to return Wilford's fire.

Oaklands heard me for some time in silence, and I began to fear my efforts would be fruitless, when suddenly he turned towards me, and said—his fine eyes beaming with an almost womanly expression of tenderness as he spoke,—"Would this thing make you happier in case I fall?" A silent pressure of the hand was my only answer, and he added in a low voice, "then it shall be as you wish." A pause ensued,—for my own part, the thought that this might be our last meeting completely overpowered me; I did not know till that moment the strength and intensity of my affection for him. The silence was at length interrupted by Oaklands himself, and the low tones of his deep rich voice trembled with emotion, as they fell mournfully on the stillness of the evening air. "My father!" he said, "that kind old man, whose happiness is wrapped up in my welfare! it will break his heart, for he has only me to love. Frank, my brother!" he added, passing his arm round my neck, as he had used to do, when we were boys together, "you are young; your mind is strong and vigorous, and will enable you to meet sorrow as a man should confront and overcome whatever is opposed to him in his path through life. I will not disguise from you that, looking rationally and calmly at the matter, I have but little hope of quitting the field to-morrow alive. My antagonist, naturally a man of vindictive disposition, is incensed against me beyond all power of forgiveness, and his skill is fully equal to his malice: should I fall, I leave my father to your care; be a son to him in the place of the one he will have lost. This is not a light thing which I ask of you, Frank! I ask you to give up your independence, your high hopes of gaining name and fortune by the exercise of your own talents and industry, and to devote some of the best years of your life to the weary task of complying with the caprices, and bearing the sorrows, of a grief-stricken old man. Will you do this for me, Frank?"

"I will," replied I, "and may God help me, as I execute this trust faithfully!"

"You have relieved my mind of half its burden," returned Oaklands, warmly, "I have only one thing more to mention:—When I came of age last year, my father's liberality made over to me an ample income for a single man to live on: excepting a few legacies to old servants, I have divided this between your good little sister and yourself, which I thought you would prefer to my leaving it to you alone."

"Harry! indeed, I cannot allow you to do this; others must surely have claims upon you."

"There is not a being in the world who has a right to expect a farthing at my death," answered he; "the next heir to the entailed estates is a distant relation in Scotland, already wealthy. My father has always been a careful man, and should he lose me, will have a larger income than he can possibly be able to spend; besides, as the duties I have led you to undertake must necessarily prevent you from engaging actively in any profession, I am bound in common fairness to provide for you."

"Is it so, then," replied I, inwardly breathing a prayer that I never might possess a sixpence of the promised fortune.

"One thing more," added Harry. "When you return to the quietude of old Trinity, shall I ever visit you again?—How Miss Maurice is going on, and if she shall marry respectably in her own rank, ask

my father to give you 100*l.* as a wedding present for her; only hint that it was my wish, and he would give twenty times the sum. And now good—peas!"—he continued, drawing his hand across his eyes, "I shall play the woman if I go on talking to you much more—good night, Frank,—do you accompany us to the ground to-morrow morning?"

"I will go with you," returned I, with difficulty overcoming a choking sensation in my throat; "I may be able to be of some use,"—

"Here comes Archer," said Oaklands, "so once more good night; I must get home, or my father will wonder what is become of me."

My heart was too full to speak, and pressing his hand I turned abruptly away, and walked quickly in the opposite direction.

A LITTLE TALK ABOUT BUCKINGHAM PALACE.

(Continued.)

We resume with a bit of historical gossip, showing that, in all probability, the first cup of tea made in England was drunk upon the site of Buckingham Palace; for the Earl of Arlington took the first pound of tea to England, having bought it in Holland for sixty shillings; and at this time the Earl resided in "Arlington House," taken down prior to the building of Buckingham House.¹

We now return to the palace. Had the "triumphal arch" and its accessories been completed as originally projected, the cost of the archway, railing, and statue, would have exceeded 70,000*l.* As it is, the arch has been almost universally condemned as a monument of tasteless expenditure and extravagant folly. Cobbett, in his odd, sarcastic way, used to say, that he had often, in crossing the park, halted to look at the structure without being able to "make anything of it," in which unsatisfactory result there must have been many sharers.

The other arch, originally intended as a grand feature of the remodelling of the palace, may be noticed here: this is the costly "triumphal" structure facing Hyde Park Corner, which now forms the public entrance into the Green Park, by Constitution Hill, but was originally intended for the royal entrance to the palace gardens. This arch was built by Mr. Decimus Burton, in 1828; it is eighty feet in height, and has a single aperture, with an architrave surmounted by an archivolt, without a keystone; an innovation by no means pleasing. The sides are decorated with Corinthian pilasters, and sculptured wreaths of laurel, inclosing "G. R. IV.," and crowns, alternately. In each front, from the four central pilasters, a portico of four columns projects on two solid plinths. Above the entablature, on a lofty

(1) It will be remembered that against Arlington, as one of the Cabal ministry, articles of impeachment were preferred in 1674: one of the charges being that he had been wanting in fidelity to his trust as a private councillor, as a sworn defender of the Protestant religion. The Earl met this and other charges against him so dexterously, that the impeachment was dropped. At his, however, lately been proved that Arlington was of the Catholic faith; for, in "the Autobiography of Sir John Brampton, B.," printed for the Camden Society, we find this entry:—"About this time the Earle of Arlington, Lord Chamberlin, died, a Roman Catholic, and they tell this storie of him. That day that he dyed he askt his phisitian if there were noe hope left of his life; he sayd he did see none; he thought he would die verie speedily. Then sayd my Lord, 'Fetch me a pretist, for I am a Roman Catholic.' His servants were amazed, but he sayd he would have a priest fetcht; 'Yet,' says he, 'I will not have it knowen until I am dead.' Soe he had a priest, was absolved, and soe he died at that Church, tho' he had receaued the Sacrament very often, had taken the Test, where he renouced Transubstantiation, the worshiping of the Virgin Marie, &c. several tymes; as a Puer in the Lords House, and as the King's servant, both in the last King's tyme and in this present King's too."

blocking-course, is raised an attic, surmounted by an acroterium; the soffit of the arch is sculptured in sunken panels; and within the piers are apartments, and stairs ascending to the roof of the attic; the entrances being at the side, and, with the windows, having a mean effect. The gates, by Bramah, are of massive iron scroll-work, bronzed; the design comprising the royal arms, in a circular centre: they are handsome, but less original than the superb palace gates we have just described. Mr. Burton's original design for the arch, it should, in justice, be mentioned, has not been carried out. He proposed to embellish the main piers with groups of trophies; to place a figure of a warrior on each stylobate; to enrich the attic with a sculptural representation of an ancient triumph; to place a statue, flanking the attic, over each column; and to crown the acroterium with a figure of Victory, in a quadriga, or four-horse chariot. Had these embellishments been executed, the arch would not have been condemned, as it has been, for its insipidity of design, and absence of classic appropriateness. At this point, by the way, the late Sir John Soane proposed to erect an entrance into Piccadilly, of architectural stupendousness, and most elaborate sculptural enrichment: it was to consist of two large side arches, opening to Hyde Park and the Green Park, and a vast arch spanning the Piccadilly roadway, at a height entitling to the epithet of triumphal. The cost would have been enormous; but, had the design been executed, it would have presented the most magnificent metropolitan entrance in Europe, and have been really worthy of "the city of the world."

Upon Mr. Burton's arch, as the reader is, doubtless, aware, has been placed Mr. Wyatt's colossal equestrian statue of the Duke of Wellington. Previous to this, to give security to the immense weight which the attic has now to carry, it was strengthened at each angle by a cross buttress; and the supporting slab is laid upon a strong brick arch. The statue was designed and cast expressly for this position, after the Queen's consent had been obtained for its location there; for which purpose also, the funds were subscribed by the public: and, on the royal permission being granted, Her Majesty remarked, that were the monument placed upon the arch, as proposed, in leaving the palace for a ride, she should have the satisfaction of seeing the statue of the greatest man in her dominions.

To return to the palace, the view from the platform of Mr. Burton's arch comprises a *coup d'œil* of the royal gardens, and shows the vast circular reservoir, the lake, &c. and the pavilion, of which we shall speak in detail hereafter.

To resume, chronologically: soon after the accession of William the Fourth, it was resolved to complete the palace, and have it furnished as a royal residence. Previously, however, to this being done, in the summer of 1831, the public were admitted to view the interior of the palace, by tickets, for parties not exceeding six persons; and within the limited time many thousands availed themselves of this privilege—ourselves among the number. The floors were then uncarpeted, but the mirrors were fixed throughout the several apartments. The general characteristic was a waste of gold, glare, and glitter, in the worst possible taste; the coved ceiling of the throne room, we remember, "fretted with golden fire," resembled the top of a work-box; the multitude of gilt capitals was very striking: each of these cost 30*l.*, whilst a contract for 18*l.* each had been refused! There were several pairs of gorgeous folding doors, of mahogany and plate-glass, overloaded with ormolu, each costing 300 guineas a pair: they were in very questionable taste, and were better adapted for a flashy gin-palace than the abode of royalty, and several of them were accordingly removed. We remember the obvious defect of there being but one state staircase; the sculpture gallery with only a borrowed light; and the library, at the door of which it was scarcely possible

to read. In the principal floor, the octagonal apartment of the library of George the Third was unappropriated. It had been proposed to fill the compartments of the walls with the cartoons of Raphael from Hampton Court; but no sooner was this proposition intimated to the public than it was loudly protested against, and at length given up. Indeed, this removal of the cartoons would have been an injustice to the public for the mere purposes of private gratification.

In our stroll through the palace we were much struck with the picturesqueness of the garden-front, and the cheerfulness of the apartments in this portion of the plan. The terrace-walk was very beautiful; and at each extremity was an Ionic temple-like conservatory, the roof and walls filled with plate-glass, and each to be filled with the rarest plants.

It was a strange sight to witness the eagerness with which the holiday folks rambled through the stately staircases, corridors, and saloons of the vast palace; how a few, of a more contemplative cast, lingered beneath the canopy in the throne-room, from whence the sovereign, by a slight turn of the head, might descry the architectural glory of the metropolis—the matchless dome of St. Paul's cathedral. Then, the lofty windows of the ante-room were thrown open, and by this means two or three of the visitors had strayed out upon the floor of the great portico, and were enjoying the park prospect astride the balustrade. However, as the people reflected upon the vast outlay for the palace, they saw before them as a sort of compensation, the landscape-garden of the hitherto enclosed waste of St. James's Park; and it may be worth while to glance at the effects of the change. "Sixty years ago," wrote the late Theodore Hook, "the Mall continued the fashionable promenade, in the evening: it is now only useful as a thoroughfare from Whitehall to Piccadilly, and evening promenade there is none; for the class of persons who give the tone to society dine at the hour at which their grandfathers supped, and dress for dinner at the period when their ancestors, two centuries since, were undressing for bed. But the beautiful garden which has superseded the swampy meadow, and the Dutch canal within the enclosure, is thronged in the summer evenings with those who *have* dined, and enjoy themselves quite as much as those who *have not*; and affords a new source of amusement to the public, and keeps pleasure-hunters away from the suburban tea-gardens and bowling-greens, which within the last quarter of a century were so popular with Londoners."

Soon after the admission of the public to view the palace, its fittings were proceeded with; which occasioned the small wits to say that it was "*built for one sovereign, and furnished for another.*" Considerable alterations were also made in the palace itself by Mr. Blore: the cupola, or dome, was taken down, and replaced by one of much smaller size; and the principal front was raised, so as wholly to conceal the cupola from the spectator in the park, while it continued a feature in the garden-front, as was originally intended. This amendment had also the additional advantage of preventing the principal front from being overpowered by the wings, and of giving increased stateliness to the whole pile.

At length, the New Palace actually became a royal residence, being taken possession of by Her Majesty, very shortly after her accession, viz. July 18, 1837. Thus, we see that seven entire years, or the whole reign of King William the Fourth, were spent in furnishing and altering the palace as a habitation for the sovereign; and even then, the state apartments were exceedingly limited in number, and by no means very spacious in themselves. King William and Queen Adelaide did not appear anxious to tenant the New Palace: they passed much of their time at Windsor, and a regular season at Brighton; using St. James's for levees and drawing-rooms, and a few apartments were refurbished to fit this palace in some degree for a royal residence. Hence the com-

pletion of Buckingham Palace was not expedited. We may here state that the cost of the palace itself, including the architectural after-thoughts, but exclusive of the expense of furnishing, has been 678,777*l.*; and never was outlay more unsatisfactory to the country. Satire of all sorts has been freely let fly at the design. Dr. Waagen, the eminent German critic, quaintly says:—"Buckingham Palace looks as if some wicked magician had suddenly transformed some capricious stage scenery into solid reality;" upon which another comments, "would that the same magician could re-transform it, and at the same time return the many hundreds of thousands of pounds it has cost into the exchequer."

The site of the palace, seen from Piccadilly, appears very low; and, in consequence, it is supposed to be smothered in the prospects from the windows. However, there is nothing so bad but that something may be said in defence of it; and so it is with the palace site. Looking at the structure, much of this censure may be correct; but situation cannot be duly appreciated by looking at it;—by looking from it, the extent and variety of the prospects can only be rightly estimated. In each direction, except on the Pimlico side, the views are not only the most extensive, but the finest in all the metropolis. From the eastern front, there is no other prospect in any part of London so magnificent. In the foreground lies St. James's Park, with the lake and island; on the left is the massive palace-house of the Duke of Sutherland; and next is the mansion of Lord Spencer, one of the best designs of Inigo Jones, with the other fine buildings which face the Green Park. On the right is Westminster Abbey; and in perspective the Horse-Guards, the Treasury, and the Admiralty; and beyond them are the dome of St. Paul's, and the spires of the City churches. Another fine feature, too, is the lofty colonnaded terraces of Carlton-gardens, and the statue-crowned York column. The view from the north side comprehends the Green Park, with the terrace of Piccadilly, from Devonshire House to the princely mansion of the Duke of Wellington; the beautiful entrance-screen to Hyde Park; and the loftier arch opposite, at the moment we write crowned with the most stupendous bronze group of modern times. The foreground of this prospect, too, has been much improved by the removal of the Ranger's Lodge and shrubberies from the verge of the Green Park, on the north side of Piccadilly. The south side of the palace looks towards Pimlico. The garden, or west front, looks over an extent of sixty-three acres, laid out in the very best style of landscape gardening.

The approach to the palace is by the main mall of St. James's Park; and had the communication been made direct to Charing Cross, as contemplated, the road would be by a noble straight avenue to the marble triumphal arch already described. We may here add, that over the side gates in each face of this arch are figures of England, Scotland, and Ireland; Genius exciting Youth; Virtue and Valour; Peace and Plenty; and over the central archway are figures of Fame and Victory, and a sculptured key-stone. It was, however, originally intended to place on the park face of the arch a representation in bold relief of the battle of Waterloo; and on the opposite face the battle of Trafalgar; besides medallions of Wellington and Nelson, groups of trophies, statues of heroes, &c.

Behind the arch, the palace comprehends a quadrangle, or open square, of 240 feet in extent on each side, being about the same size as the quadrangle of Somerset House. The principal and governing order is the Roman-Corinthian, raised on a Doric basement. The central mass of the design is composed of a bold *ports cochère*, or superior portico, of eight coupled columns, and corresponding towers, with four columns at either extremity. The tympanum of the centre pediment is filled with sculpture, and the pediment crowned with statues. The projecting wings or sides of the quadrangle are of a subdued character; the ends

towards the park presenting Corinthian porticoes, surmounted with statues, and adorned with sculptures: on the left wing are figures of History, Geography, and Astronomy; and on the right, Painting, Music, and Architecture. Around the entire building, and above the windows, is a frieze combining in a scroll the rose, shamrock, and thistle; and extending from each wing, facing the park, is a screen or wall, with private entrances. The northern wing was originally occupied by the Duchess of Kent and her Royal Highness's household: it is now the royal nursery. Of the northern and southern fronts we have already spoken: the octagonal apartment in the latter (intended for a chapel) has, we believe, been fitted up as an armoury. The garden-front is, however, in an architectural sense, the principal one: it consists of five highly ornamented Corinthian towers, the centre one being circular. A balustrade terrace, extending the whole length of this front, between the two Ionic pavilions, one of which has been converted into a chapel, adds greatly to the general effect, by seemingly increasing the elevation, while it spreads a broad base that augments the apparent strength and grandeur. The upper portion is embellished with statues and groups of trophies, and historical bas-reliefs, designed by Maxman and others.

We will now examine the interior.

Having passed through the triumphal arch into the quadrangle, which is surrounded by a peristyle of Grecian Doric columns, instead of an arcade, we pass under the portico into the marble hall. The ceiling is only eighteen feet high, but is supported by an extensive range of double columns, standing on an elevated continuous basement, every shaft formed of a single piece of veined white (Carrara) marble, with Mosaic gold bases and capitals; whilst the marble floor has a Mosaic Vitruvian scroll border. Thence you ascend by a broad flight of steps to the sculpture gallery, one hundred and twenty feet in length, with marble columns and floor corresponding with the hall. The sculpture in the gallery consists chiefly of busts of eminent statesmen, and members of the royal family. This gallery extends the whole length of the central portion of the ground plan, corresponding with the picture gallery above it. It opens into the library, or council-room, which has a semi-circular termination in the central portion of the garden front. When the door of this room is open, the vista from the grand entrance across the hall, sculpture gallery, and library, to the very windows opening to the garden terrace—indeed, through the entire edifice—is a scene of architectural picturesqueness. To the right and left of the library are moderately-sized rooms, which command the cheerful retirement of the garden scenery. These apartments, in their furniture and decoration, combine elegance and luxury with simplicity and comfort: they must be a welcome retreat from the gold and glitter of the state rooms; and opening upon the terrace, with its picturesque vases of flowers, they enable you to enjoy in the beautifully undulated grounds, "a mimic Arcady embosomed in deep foliage," as it has been called, "a gay delicious solitude rescued from the *sumum strepitumque Romæ*."

Re-crossing the hall, a spacious flight of marble steps leads to the grand staircase, also of white marble, and on the left hand as you enter from the portico. This staircase consists of a centre and two returning flights, the former being carried up to the entrance to the armoury, from which the effect is beautiful and theatrical. This staircase has lately been decorated, by Mr. Gruner, after the manner of the Italian masters; on the ceiling are four frescoes of morning, evening, noon, and night, on gold ground, with exquisite imitations of marble, &c. The staircase itself is too small; but the rail, supported on bold and rich Mosaic gold scroll-work, has a superb effect, especially in continuation of the golden capitals and bases of the columns in the hall. The library, by the way, is used as a waiting-room for deputations, which, as soon as the Queen is prepared to receive them, pass

across the sculpture gallery into the hall, and thence ascend by the grand staircase, through an ante-room and the green drawing-room, to the throne-room. The mahogany folding doors, over-ornate with looking-glass and ormolu, (of which we have already spoken,) are here unaparingly introduced. Upon state occasions, or grand receptions, the hall and staircase are lined by yeomen of the guard, with the exons, lieutenant, and clerk of the cheque, the whole presenting a magnificent scene of pageantry and regal state. A staircase for the egress of company has been constructed on the right side of the hall, since the original plan was made.

The green drawing-room, which occupies the centre of the eastern front, and opens upon the upper or Corinthian story of the portico, is a superb apartment; the walls are hung with green satin, striped, relieved with tasteful gilding; the room is some fifty feet in length, and thirty-two feet in height; it has an almost endless series of looking-glass in door and shutter panels, and elaborate frames, which reflect a beautiful little panorama of the park enclosure, caught through the marble arch and the pillars of the exterior portico. When state balls are given, the spacious tent, formerly belonging to Tippoo Saib, is raised beneath the portico, and the windows being removed, refreshments are served here to the company: it thus has the effect of enlarging the saloon. It is lit by an "Indian sun," eight feet in diameter, set round a chandelier, which throws down the light upon the company with brilliant effect.

We next advance to the throne-room, sixty-four feet in length, which presents a blaze of elaborate enrichment. The walls are hung with crimson satin, striped; and the alcove, on the north side, with crimson velvet, relieved with a profusion of gilding, and emblazonry of arms, &c. The fascia consists of massive gilt wreaths, and two large figures bearing a gilt medallion of George the Fourth. In this recess is placed the royal throne, or chair of state. The ceiling of the room is coved, richly emblazoned with arms, and gilded in the boldest Italian style of the fifteenth century. Beneath is a white marble frieze exquisitely sculptured by Bailey—the design, the Wars of the Roses, Stothard's last great work. In this room are presented addresses to the Queen, in state as picturesque as it is splendid: there, Her Majesty is seated on her throne in her royal robes, with the Prince Consort on her left, and surrounded by her ministers and great officers of state, the court, &c.; the deputation then advance through an avenue of the gentlemen-at-arms, and the address is duly presented. For the christening of the Princess Royal, in February, 1841, the throne was removed from the recess, and in its place was erected an altar, hung with crimson velvet and gold, and upon it was ranged the silver-gilt communion-plate; the font being placed upon a Mosaic table, upon a richly embroidered velvet carpet; the effect of the whole was impressive and superb. This room is, altogether, very gorgeously appointed. The profusion of gilding, the richly fretted cove of the ceiling, the curved and gilt *boriture* of the crimson satin hangings and draperies, and the large and brilliant mirrors in massive gold frames; and the richly-dight insignia and canopy of the throne recess; the superb lustres with their myriads of prismatic glitter—all make up a scene of overpowering richness, relieved only by the chaste beauty of Stothard's white marble frieze of the Wars of the Roses—the great chain of events, by which the royal family, as descendants of the Tudors, came to the throne. In this chamber, too, are ordered more important matters than mere forms of

state ceremonials; and the saloon is generally provided with a long table and a number of seats for the accommodation of the ministers when they and the Queen are "in Privy Council assembled."

A CHRISTMAS PARTY IN THE COUNTRY.¹

CHAP. XI.

"Ah! James," said Lucy, "though you did remember our dispute when you wrote this, you have not, as I had hoped, made the *amende honorable* to the daisy. What can you advance from the poets in favour of the gaudy marigold?"

"I do not know how I shall acquit myself under this challenge, Lucy," he replied, "but it certainly has some poetical claim. Its botanical name *Calendula*, which affirms it to bloom in the course of every month, has a sweet echo in its Italian title *Fiore d'ogni mesi*, whilst it shares with the sunflower the honour of being considered an emblem of constancy, turning to look towards the sun in his course through the heavens, and opening its eyes to receive his first beams, when—

'The early morn lets out the peeping day
And strews his path with golden marygolds.'

As the exception is said to prove the rule, I will even quote from Beaumont's *Psyche* the only instance which I know to be on record of the marygold's fickleness.

'The marygold her garish love forgot,
And turned her homage to these fairer eyes;
All flowers looked up, and dutifully shot
Their wonder hither, whence they saw arise
Unparching courtous lustre, which instead
Of fire, soft joy's irradiations spread.'

But," he continued, "the most beautiful lines I know on this flower, are in that old work, 'Wither's Emblems,' and at the risk of tiring you I will venture to repeat them.

'When, with a serious musing, I behold
The grateful and obsequious marigold,
How duly ev'ry morning she displays
Her open breast, when Titan spreads his rays;
How she observes him in his daily walk,
Still bending towards him her small tender stalk:
How, when he down declines, she droops and mourns,
Bedew'd (as 'twere) with tears, till he returns;
And, how she veils her flowers when he is gone,
As if she scorned to be looked on
By an inferior eye; or, did contemn
To wait upon a meaner light than him.
When this I meditate, methinks, the flowers
Have spirits far more generous than ours;
And give us fair examples to despise
The servile fawnings, and idolatries,
Wherewith we court these earthly things below,
Which merit not the service we bestow.

But, oh my God! though grovelling I appear
Upon the ground, and have a rooting here,
Which hales me downward, yet in my desire,
To that which is above me I aspire:
And all my best affections I profess
To Him that is the Sun of Righteousness.
Oh! keep the morning of His Incarnation;
The burning noon of His bitter Passion;
The night of His Descending, and the height
Of His Ascension, ever in my sight:
That imitating Him in what I may,
I never follow an inferior way.

"How beautiful!" exclaimed the whole party.
"How very beautiful!" said Rosaline. "Surely we must all adopt the marygold now amongst our favo-

(1) The venerable Stothard was between seventy and eighty years old when he designed this frieze; yet it possesses all the vigour and imagination which had distinguished his best days. As a whole, there is not, perhaps, to be found a more interesting series of historical designs of any country in ancient or modern times. The drawings of this frieze ought to be in the royal collection, but they were sold at Christie's with the rest, on the decease of the painter; Mr. Rogers was the purchaser.

rite flowers, though it is not indeed a native of this country."

"There is the marsh marygold, Rose," said Agnes.

"Yes, Agnes," replied Sophia, "but you know well that it is not one of the same class of plants as the real marygold, but is one of the ranunculus tribe, and allied to the buttercup, its botanical name *Caltha*, implying a goblet; and truly it resembles a golden chalice. We have, however, many flowers which, though not of the same family as the marygold, resemble it in turning towards the sun. Besides the daisy, there are the ox-eye, the hawkweed, the flea-bane, &c."

"Pray, does the hawkweed in any way resemble a hawk?" asked Mrs. Barlow.

"Not at all," replied Sophia. "For the derivation of that term, which is the same as its botanical name *Hieracium*, derived from the Greek name for a hawk, we must refer to the conceits of the old botanists, who believed that it was from using the juice of this plant that hawks and other birds of prey acquired their wonderful power of vision; and this strange opinion must have been pretty widely spread, if we take the testimony of the French name *Epervière*, and the German *Habichtskraut*."

"I suppose then the cuckoo eats the flower which bears its name in order to clear its voice," said Alleyn.

"Oh! Alleyn!" cried Agnes, "do you not remember the old nursery song says, 'he sucks little bird's eggs to make his voice clear.' I know the cuckoo-flower is called so because it comes in spring when the cuckoo does, and I remember Sophia told me that Gerade says, 'it flowers for the most part in April or May, when the cuckoo doth begin to sing her pleasant notes without stammering.'"

"Bravo! Agnes," exclaimed her father, "you are improving rapidly when you too begin to quote Gerade, and I do not despair of your being a second Sophia at last. What flower is it that Gerade calls the cuckoo-flower?"

"I believe, papa, it is the *Cardamine pratensis*, and you know that it is called so here, but Laura says the cuckoo-flower is a different flower at Woodthorpe."

"Laura is right," said Mrs. Barlow, "there the pretty little woodsorrel is called the cuckoo-flower, and I think I have heard the name given to other spring flowers besides these."

"I believe, however, that the *Cardamine* has the best established claim to it, Mrs. Barlow," said Mr. Hamilton; "and there are few flowers more interesting to me than this, from its association with the early days of Egypt and Greece. It is one of those ever recurring phenomena of nature which link us with the past; and, when I see the pale blossom springing in the fields, and at the same time hear the cheerful voice of the cuckoo, I am carried back to the days of Hesiod and Aristophanes, and remember that the latter tells us 'the cuckoo formerly governed all Egypt and Phœnicia, because when that bird appeared they judged it was time for wheat and barley harvest.'"

"Has not the *Lychnis Flos-cuculi* or Ragged Robin some claim to the name of cuckoo-flower?" asked Mr. Lorraine.

"It certainly has from its Latin appellation," replied Mr. Hamilton, "and the fig tree has likewise a claim from the Greek, since in that language the same word denotes both the cuckoo and the young fig. The reason assigned for this coincidence is, that they appear together, a circumstance remarked by Benjamin Stillingfleet to happen in this climate also. The early Greek writers paid much more attention to these natural signs than has since been done, and, though the writer I have just named, and also some of the Swedish botanists, endeavoured to follow out the hints they gave, there has been but little progress made. To my mind it appears a most interesting study, not only because it leads us to meditation on the beautiful and harmonious works of nature, but because it takes us

back as it were in the history of man, and, amidst all the superstition with which his mind has been darkened and debased, allows us to catch here and there a glimpse of purer light—a tint of the bright hues of paradise."

"To what do you allude?" asked Mrs. Barlow.

"I allude to the ancient superstition of augury, with which the subject under discussion is intimately connected. The word augury is derived from *avis*, a bird, and though in later times the augurs prophesied from the signs discovered in the entrails of their sacrifices, &c. &c., it seems that originally they drew their predictions solely from the flight of birds. And can we wonder that the mysterious migration of birds at certain seasons, and their return from the ocean or the desert with unfailing wing, without pathway, and without guide, should strike the inquiring mind with awe! and may we not fancy the wondering philosophers addressing them in the words of our own English poetess—

'Birds! joyous birds of the wandering wing!'

Whence is it ye come with the flowers of spring?"

"How beautiful, how wonderful," he continued, "is this perpetual harmony of nature, which brings the birds back with the reviving flowers, and, year after year, teaches us to look for the one accompanied by the other, and to anticipate pleasure after pleasure in welcoming them, until nature beams out in one universal flush of joy and love! As star after star becomes apparent in the heavens whilst the night advances, so do the bright things of the earth come up silently until they are spread thickly around us as the lights above. There is, indeed, a striking grandeur in the study of the heavenly bodies, which has given to astronomy a pre-eminence of awe, but, if rightly viewed in connexion with the harmony of the whole vast design, surely every branch of natural philosophy would awaken the same feeling, and I would maintain that the earlier and more true mode of prediction, drawn from the flowers and the birds, has a stronger claim to our belief and reverence."

"I do not quite understand you, James," said Mrs. Lorraine, "this theory is new to me. Surely the motions of the heavenly bodies are more strictly defined, and consequently more to be relied on, than the return of the birds or the revival of the flowers; and we cannot wonder that the former are preferred as guides for the times and seasons."

"I will grant you, my dear madam," returned Mr. Hamilton, "that the movements of the heavenly bodies are the most chronologically regular, but for this very reason they are less to be depended upon as prophets of the seasons—for I would speak only of predictions applying to husbandry, horticulture, &c. The first astronomical calendars were made in Egypt, and thence transplanted into Greece, where the difference of latitude and longitude was not so great as to occasion any material discrepancy between their calculations and the seasons, though some there certainly was; but when the Romans afterwards servilely copied the Greek calendar, the farther change of the locality rendered them still more unfaithful; and yet their great poet, Virgil, in his *Georgics*, has adopted them, and overlooked the signs of the trees and flowers around him. Hesiod, who was, according to some, an earlier writer than Homer, according to others, his contemporary, was the first known writer who noticed these signs, though doubtless in his time, and probably long before, husbandry was partly regulated by the blowing of plants and the migration of birds. Hesiod was followed by Theophrastus, but the subject, after the latter writer, was no farther explored, I believe, until the time of Linnaeus, who, with the help of his disciples, completed the Swedish calendar of Flora, in imitation of the Greek Flora calendar of Theophrastus."

"I think I have heard of the calendar of Flora," said Sophia, "though I do not remember to have seen

it. Pray, is it really useful, or merely a fanciful and poetical trifle?"

"Fanciful it certainly is not," replied Mr. Hamilton, "since it is founded on a strict observation of facts, compared together year after year. As to its utility, that has never yet been fairly tried, but I am inclined to believe, with Linnæus and Harold Barck, that it might be rendered permanently useful. Nature always adopts the most simple and easy method of working, and from the same cause brings forth different designs. In many cases we see and acknowledge this, in others it is concealed from us; yet we may well assert that, whenever two things, however distinct and separate they appear, to be in their natures, constantly accompany one another, they are actuated and influenced by the same causes. Thus the swallow and the wood anemone, like the cuckoo and the young fig, appear together about the middle of April. It is not the stars which guide the bird, or the sweet influences of the Pleiades which revive the flower, but it is the returning warmth of the season which acts upon the nature of both, and if the season be backward, and

'Winter lingering chills the lap of May,'

both will be equally retarded for a few days, whilst the stars move on in their distant and time-measured journey. When Aristotle says that the nightingale sings continually day and night for fifteen days, about the time when the young leaves begin to expand and thicken the woods, he not only marks the time when the nightingale might be expected to be heard in Greece, but the season of its melody in every other country which it frequents, which would not have been the case had he noted the month or day; for in England and Sweden it does not charm the ear at the same time it does in Greece, yet in the same season it is with all, 'when the young leaves expand and thicken on the mountains.' Trees observe fixed laws in their time of leafing, some requiring one degree of warmth, and some another. The oak never puts forth its verdure before the larch flings down its green tassels gracefully as an emerald fountain, nor does that timid stranger, the acacia, hang out her pale blossoms to rival our hardy native hawthorn, but the gay procession marches onwards in regular routine; and those who have been in the habit of watching its progress year after year may know, when they see one tree come into leaf, which will be the next to don the livery of spring. Nature herself—or, rather, the great God of nature—seems thus to trace in living characters his instructions to the husbandman; but man has sought out many inventions, instead of attending to the unerring signs so beautifully spread before him. In some places, indeed, the page of nature's book is still read unconsciously, and the mower guesses the proper time for cutting the grass from the flowering of the *parnassia*, the withering of the purple meadow-trefoil, or the ripening of the seeds of the yellow-rattle; but from scientific men the subject has met with less attention than it seems to deserve, and would botanists try to work out this sublime idea, as Howitt calls it in his 'Book of the Seasons,' doubtless surer guides might be obtained than those which now regulate the labours of the field."

"It is truly a sublime idea," said Sophia; "but has there never been a calendar of Flora constructed for this climate?"

"Benjamin Stillingfleet, a naturalist of the last century, took great pains in noting the seasons in which different plants flowered, and different birds appeared for several years together, and published an English Floral calendar, with a translation of that of Harold Barck, not as a perfect work, but as an assistance to those whom he hoped would follow in the same track. I should like to show it to you; but of course I do not travel with all my books in my portmanteau."

"Do you think we can get the work from the library at R—?" asked Cyril. "I will make the inquiry

to-morrow, if you like, as I intend to ride over in the morning on some little business of my own. Ladies, have you any commissions? Aunt Martha, you have been so busy over your knitting all the evening, you have not had time to speak one word, and I am sure you must have used up all your fine scarlet wool, and be in want of a new stock."

"No, thank you, Cyril," replied aunt Martha, "I have still this huge ball left, which will suffice to complete my task; but I think, perhaps, I may find some other little office for you at R—."

"Cyril need not fear a scarcity of commissions," said Charles, laughing, "for whenever I announce a journey there, I am obliged to strengthen my memory by a list as long as my first brief will be; and then, when I am setting off overwhelmed with business, old Watson is sure to pounce upon me from out of her den, with, 'Please, master Charles, would you be kind enough to call at the grocer's, and tell him he made a mistake in the last parcel;—and if you would only bring me this—and that—and the other;—till I rush out in despair, leaving the good old soul with a rueful countenance, which haunts me until I have executed all I so rudely refused to her.'"

"And then, Cyril," added Alleyn, "take care how you pass the Vicarage, or Charlotte Forster will be sure to want a bottle of paregoric, and Alice be longing for the second volume of some Winter's Tale or other."

"Oh! I have got all the commissions from the Vicarage," said Cyril, "I was there some time this morning, and I think it was the numerous wants of their party which induced me to plan the journey, so I hope I shall forget none."

"I think I must ride with you, Cyril," said Frederic, "in order to search the old book-stalls for a rhyming dictionary, as I find the task Agnes has imposed upon me too difficult for my genius, without such assistance."

"Write something in blank verse, then, Coz," said Agnes, "you know Cowper wrote his task in blank verse to please his cousin, and I like blank verse very much, though it is rather more difficult to learn by heart; and I shall like to learn your verses by heart, of course. I wish, James, she continued, turning to Mr. Hamilton, "I wish you would write a charade in blank verse, and Cyril shall buy me a pretty little book, that I may copy all the charades into it for Justine, as she wishes to have them."

"And I will draw the flowers in it, Agnes," said Sophia, "and Rosaline shall sketch the house for a frontispiece, and Lucy design a vignette for the title page; so take care Cyril, that you get the paper very good and very smooth."

"What a charming present that will be, and how much I shall value such a treasure!" exclaimed Justine.

"Well, Agnes, you must give me the proper dimensions for the book, and full particulars, that I may get it quite as you want it, or else I know you will shake your head at me most outrageously."

"Oh, dear! then mamma must let me see how many charades she has left, and I will leave plenty of room for that which James is to write for me. Do let me have a peep, pray do!" continued Agnes, whilst Mr. Hamilton begged he might select the following for their present amusement.

How joyful the welcome my *First* still receives,

As year after year he is heard!

As soon as sweet April hath put forth her leaves,

Returneth that passenger bird.

He calls for my *Second* from every spray,

And gladly the call will be heard;

Starting forth from each bank will my second obey

The voice of that passenger bird.

But surely my *Whole* with affection's quick ear

His earliest note must have heard,

Since her pale buds expand as his first cry we hear,

Delighted to greet him, but soon disappear

When away flies that passenger bird.

PISCATOR'S SKETCHES.

CHAP. II.

"Resounds the living surface of the ground:
Nor undelightful is the ceaseless hum,
To him who muses through the woods at noon."

It is now noon. The sun pours down his rays; the breeze is hushed; the river reflects a thousand hues from mirrored surface.

A truce to sport! The associations of the angler are full of fascination, which the multitude can never discover. Come, citizen, leave, for a while, your ledgers and your calculations; come, worldly wayfarer, leave, for a while, the beaten and dusty road of life; come, votary of fashion, leave, for a while, the gay and giddy scenes of the capital. We do not purpose fixing your attention upon works created by art and science; nor do we purpose escorting you through the courts and palaces of kings; but we ask you to wander with us under the cloudless canopy of the blue expanse. By the clear stream may ye mark nature's own loveliness. Her productions have charms for the angler—why not for you? How often does he, in such seasons, and in such climes, cry "Truce to the angle," that he may explore the enchanting scenes around, and dive into the mysteries of botanical and entomological lore! His occupation with his angle in the running streams through the fair vales, first rendered him familiar with the sounds and objects of the surrounding landscapes. It was this that led him first to look upon the fair face of nature, and to exclaim, "How beautiful—how sublime art thou!"

Why, what clusters of flowers meet the eye at every turn! How brilliant their hues; how delicate their tints! These owe nothing to the culture of man; no art has arrayed them in such loveliness; they are fresh, and bright, and beautiful, from the fair hand of Nature herself. You cannot add one hue, or one tint, to render them more gay and glittering: "Solomon in all his glory was not arrayed like one of these."

Mark the tall and stately rush, with its inch of red and pink flowers; the fringed buck-bean, with its yellow hues and notched petals; the thick stems of the water-lily, with its broad leaves, in the centre of which the yellow flower rests its modest head; the iris, with its stately stems and flowers of flaming gold.

Mark also how transcendently beautiful the various tribes of insects which sparkle in the sun. See how the dragon-fly, the tyrant of the insect world, flits through the air: listen to the sharp buzz of his glistening wings as he darts up the stream: how splendid that purple coralet! what slim elegance and graceful ease in all his movements! How fiercely he pounces upon his prey; how voraciously he seizes that butterfly, and crushes it with his formidable fangs! Mark also the bustle and glitter of the multitude of whirlwigs of the beetle genus, at the surface of the still water, under the shade of the old willow. How their tiny backs flash as they describe their incessant round! See, too, the butterflies, which have strayed from their resorts, how in radiant wings they flutter from flower to flower. What a bright train! There is the lady-of-the-woods, from her sylvan retreat. With what pride she displays those wings, tinged with orange, and adorned with green! How delicate and how beautiful she appears, and how worthy her appellation! There too is our old friend, the peacock's-eye: how elegant his colours of pale silky brown, and yellow, and purple hues, with the eye-like spot on each wing. He has come forth rejoicing with the rest, and is evidently not a little proud of his race and lineage. But what have we here! The chalk-hill butterfly, revelling in the sun-beams. What a gay little

rover. Observe the light silvery blue, and the streaks of orange with which he is bedizened; these, with the fine silky lustre of his whole attire, distinguish him as one of the most elegant of this species of revelers in these sunny climes. Why, the earth and air are warm with millions of beautiful things. How poor the boasted productions of man when compared with the magnificent hues of the purple Emperor there, who selects as his throne the topmost sprig of yonder lofty oak! With what dignity he unfolds the varying lustre of his plumes! How brilliantly are the rich tints displayed, the delicate pearly lustre of his wings changing with each revolving motion to the imperial hues of purplish blue! No courts of earthly potentates could display so glittering and so gorgeous a train as that which disports on every side.

But let us seek the cool shade. Here will we rest awhile, and turn our back upon the turmoil of the world: here, for a season, care shall be a stranger to the heart, as we sing one of the songs of Isaac Walton—

"Oh, how happy here's our leisure!
Oh, how innocent our pleasure!
Oh, ye valleys! oh, ye mountains!
Oh, ye groves, and crystal fountains!
How we love, at liberty,
By turns to come and visit ye!"

In this lovely and sequestered spot how grateful the refreshing breeze—before us the rippled and sparkling waters—the green wood on the left echoing to thousands of tuneful throats. Here, we say, let us rest, not to "rail at lady Fortune," but to offer the incense of gratitude to Providence for having created these scenes, teeming with so many beautiful things, to form the solace and delight of man.

Mark the aquatic birds, how they visit the stream. See that heron on outstretched wings, from the peaceful recesses of the old wood. He has now alighted on that large stone at the edge of the water in quest of prey. He loves the banks of streams. With what grace he wades into the current. How purely white that throat and breast—how graceful his black narrow plumes! He used to form the quarry for the falcon in the olden time, when fair dames and gallant knights rode forth,

"With hawk on fist, and hounds in leash,
And gold-tipp'd bugle horn."

See those troops of swallows in pursuit of insects; how they skim the surface of the waters! how wonderful their gyrations, as they wheel in the air, and then sweep along, and disappear under the arches of the old bridge! But listen! that is the sharp and shrill cry of the lapwing; his haunt is down in yonder fenny pasture. He is now in sight—what a beautiful fellow! His neck and breast are of deep rich black; and how smart he appears with his long crest of black feathers! How vehement his cries become, "Pee-wit—pee-wit:" you may be sure an enemy has invaded his retreats. We are not mistaken—there is the hawk sweeping overhead. He has left his favourite tree in yonder thicket, where he has so often displayed his dove-brown back, and the streaked plumage of his breast. See with what velocity he glides through the air. Now those keen eyes of his have descried his quarry; now he soars in circles; now he makes a swoop, and carries off his prey in his talons.

But we have lingered under the old oak long enough. The advanced noon warns us to resume our angle.

"Arise, and let us wander forth,
To yon old mill across the wolds;
For look, the sunset, south and north,
Winds all the vale in rosy folds."

How lovely the last two hours before sunset; the western horizon suffused with brilliant crimson tints; the trees intercepting the streams of light from the sun's broad disk, and throwing their long shadows across the landscape.

There is still a gentle ripple on the water. In the shade of those tall poplars, down by the piles driven into the bed of the river to guard the buttresses of the old bridge, and upon that gravelly bottom, lies a shoal of perch. They are now altogether at the edge of the sharp current which sweeps that margin, formed by tall weeds. See how they rise and descend in quest of food brought down by the rapid stream, like so many striped tigers of the deep.

What a noble fellow have we just brought to land;—he weighs upwards of one pound avoirdupois—one of the finest taken in these waters. Mark his colours; how exceedingly brilliant and beautiful! Talk of the denizens of Chinese waters!—why, the plump and well-fed perch lying at our feet, in vivid colouring is not inferior. Observe his back of rich olive green, shading into golden yellow; his body banded with bars of a deeper tint; his fins rivaling the brightest vermillion.

But there are many other things which invite the attention of the angler: at this serene hour the more minute portions of the insect world are on the wing.

"Thick in yon stream of light, a thousand ways,
Upward and downward, thwarting and convolv'd,
The quivering nations sport."

Watch the myriads of delicate and fragile creatures; they have just undergone their transformations, to sport away an existence which terminates when the sun withdraws his beams and the dews begin to rise. What a hum from countless tiny voices, blending in one loud chorus, as, dancing their gay rounds, they rise and fall in the sunbeams, like "showers of brilliant gems."

Listen to that sound from the tall grass in yonder meadow. It proceeds from the "corn-crake," in his favourite retreats along the river's course. "Cra-a-ke!"—why, it now seems almost at our feet; "Cra-a-ke!"—it now appears far distant. How wonderfully the creature modulates the tones of his voice; he outrivals the ventriloquist, who, after all, must study nature as his best instructor.

But heard you that dull and jarring sound from the water's edge in that low-lying meadow? It is the solacing note of the mole-cricket. The sun is now sinking fast, the dews are just beginning to rise, and the mole-cricket has already left the winding passages which lead to his curious habitation in yonder bank.

This remarkable little creature has been nick-named "Jack-a-lantern." Superstition has rendered him a terror to many a rustic, and numerous are the anecdotes related of the wicked exploits of "Jack-a-lantern," in the bogs and fens of Lincolnshire. He is there reputed to have been a most wayward wight, his mischievous pranks having exceeded those even of a whole troop of Irish fairies. Fear has magnified him into a monster—the fiery demon of the fenny waste. By the cotter's chimney-nook it used to be related of him, that, when the benighted traveller had lost his road in the surrounding gloom, "Jack-a-lantern" would rise from the stagnant waters, and render himself visible for miles around. Woe to the poor traveller! the fiery demon would flit from point to point, and then remain stationary as if to serve the office of a friendly beacon. In quest of shelter and safety for the night, the solitary and way-worn traveller would endeavour to reach the spot, and eventually lose his life in the deep waters with which the fens of Lincolnshire were intersected, ere modern art interposed to bring these wild tracts of country under cultivation.

The simple inhabitants of the outskirts of the fens in the times of which we write never dreamt of phosphorescent exhalations. They never troubled their heads about chemical disquisitions; the spirit of philosophy had never ventured into their humble abodes, or made herself welcome at their blazing hearths—sufficient for them that they saw the red demon of the putrid waters, and looked with awe upon his vagaries. The horse-shoe cast by the steed of the jaded traveller,

and found upon some wild and beaten track—this nailed upon the door possessed a charm potent enough to protect them from all evil. In this belief they were happy, and felt secure from all harm; their more enlightened neighbours had no desire to uproot their customs, or to throw doubt upon their traditions, any more than have poets any desire to throw doubt upon the story of Blondel the harper, and the lion-hearted king pining in captivity on his road from Palestine.

But the sun has now sunk below the horizon; the evening star has appeared, like a large liquid pearl. We must away, for long since has

"The curfew tolled the knell of parting day,
The lowing herd wound slowly o'er the lea."

Oh! it is at this hour alone that we share the inspiration of the poet—the hour for contemplation, when, solitary and alone, we can only feel the full truthfulness of the sweet poet's lines—

"The ploughman homeward plods his weary way,
And leaves the world to darkness and to me."

How peaceful and how calm the scene. No longer do we hear the dripping and splashing of the waters from the overshot mill,—the various songsters have gone to their sylvan retreats,—all but "the wakeful nightingale," and the honest watch-dog, whose hoarse bayings are heard far down the vale, where

"——Drowsy tinklings lull the distant folds."

But our honest friend, Farmer Mayfield, is awaiting our return, with pressing invitations to another day's sport.

The world was all before us, with its joys, and its cares, and its troubles, and its disappointments. We were like a newly launched bark, prepared to commit our fortunes upon the waste of waters.

The promise is made to revisit the hospitable scene—Ah! when will it be fulfilled?

THE PHILOSOPHY OF HEARING.

I. THE PRODUCTION OF SONOROUS VIBRATIONS.

WHAT is a sound? Is it a substance having a material existence; or a state of motion into which a body is thrown; or a mental phenomenon, existing only within ourselves? It may appear strange to some that such a question should be asked; but we believe that a little close attention will show how vague and indefinite are the general notions on this point. We see a musician beating a drum, and we say we hear the sound of that drum; but the link by which the action and the perception are connected is generally lost sight of. Let us put the question, whether the sound be in the drum, or in the ear, or in the mind; and the variety of answers likely to be given to that question will test the accuracy of the common notions on this subject. It may not, therefore, be uninteresting to enter into a few explanations respecting the phenomena of hearing.

First, then, for the production of sound. It has been satisfactorily proved by numerous and varied experiments, that all bodies which produce sound are, at that moment, in a vibratory state; and that sound cannot be produced except by such vibrations. Now vibrations cannot be produced without the existence of elasticity in a body, and we thus arrive at elasticity as one of the causes of sound. Let us take the instances of a drum, a triangle, a harp, and a fife, and see how these vibrations are excited. In the drum we see a hollow cylinder with a piece of parchment stretched over the open end; and the tension of the parchment is so great, that any attempt to bend or press it is instantly followed by a powerful reaction.

When a blow is struck on the stretched drum-head with the stick, the parchment is momentarily bent into a concave form; and the tension by which it is instantly urged to its former position is so great, that the parchment is carried beyond its original position, and becomes convex on the upper surface. This again is an unnatural state, and the parchment recedes, and becomes a second time concave. Without any repetition of the blow, the parchment will make these oscillating vibrations several hundred or perhaps thousand times, before it assumes a state of rest.

In the case of the harp-string, we have a stretched cord, whose tension is such as to make it almost rigorously straight; and any attempt to draw the string out of the straight line is followed by an immediate recoil. But as in the instance of the drum-parchment, or of a pendulum, the string does not come to a stand when it has reached its original position; the impulse which it has acquired for the recoil carries it to nearly as great a distance on the other side of the original position, and the subsequent vibrations are nothing more than efforts on the part of the string to regain its original state.

In the case of a wind instrument, such as a flute, we have a tube filled with air in a quiescent state; but, by applying the mouth at some aperture at or near the end of the tube, and blowing forcibly into it, we disturb the repose of the air in the flute. There is, however, such a tendency to reaction and compensation, in this as in most other natural phenomena, that the disturbed air seeks to regain its original state, and in so doing, generates those oscillatory movements before alluded to. One blast at the mouth of the instrument is sufficient to engender many thousands of these oscillatory movements before the air in the tube regains its quiescent state.

In the case of a triangle, we have a modified variety of the drum-head vibrations. A piece of steel, possessing considerable elasticity, is bent into a triangular form; and when one side of this triangle is struck, it is turned momentarily out of its straight form, and slightly, though imperceptibly, curved. The recoil, by which the metal is urged to resume its original state, gives to it a momentum productive of a rapid series of oscillatory movements.

Now, if we consider all the varieties of sound-producing bodies, we shall find that they are susceptible of vibrations in one or other of the ways above enumerated. The violin, the viola, the violoncello, the double-bass, the guitar, the monochord, or "hurdy-gurdy," the lute, the pianoforte,—however differently they may be played,—all yield sounds by virtue of the oscillations to which they are subjected when struck or disturbed; and the same may be said of the humming or buzzing noise produced by the bow in the process of "bowing," in the cotton and the hat manufactures. The horn, the trumpet, the clarinet, the flageolet, the organ, the syrinx, or mouth-organ, the barrel of a key, and—most important of all—the human voice, yield sounds principally from the vibration of a column of air, as in the flute: it is true that in some of these instruments there is a small reed or metallic spring, the vibration of which assists in producing the effects; and that in the voice there is other mechanism of a complicated kind; but in all of them the vibration of a column of air is the chief cause of sound. The cymbal, the tambourine, the Chinese gong, yield their sounds in the same manner as the drum; and it is in the same class that we may place all the innumerable sounds resulting from hammering, filing, sawing, and analogous operations in common life; for every tooth of a saw or a file inflicts a distinct blow on the substance on which it is employed, and by that blow sets the substance more or less in a vibratory state. Lastly, every sound resulting from the vibration of a rigid rod or bar may be classed with that of the triangle. When a boy draws his hoop-stick across a range of iron railings; when he plays on the jew's-harp; when he places the head of a pin between his teeth, and

strikes sideways on the point; or when the springs of a musical snuff-box are set in action by the pin on the barrel; the various resulting sounds are all produced on the same principle as those of the triangle; the difference being that in some cases the rod is fixed at one end and free to vibrate at the other; while in other instances the two ends are fixed, but the middle is free to vibrate.

Sound, then, results from the vibrations of the sonorous body, produced by various disturbing causes; and the next enquiry is, how do we become cognizant of these effects? If a drum be vibrating at a hundred yards distance from us, by what evidence do we know that such is the case? The atmosphere is in most cases the connecting medium, and conveys to us intelligence of the disturbance which the stretched parchment is undergoing. It is a common experiment in lecture rooms, to exhaust the air from a glass receiver, by means of an air-pump, and then to ring a little bell in the vacuum thus produced; the effect is such, that though the clapper of the bell is seen to be in violent motion, the sound produced is so feeble as to be utterly inaudible except when the ear is close to the vessel. The vibrations, in this instance, are produced as fully and effectually as if the vessel were full of air; but the ear scarcely receives the effect of those vibrations, because of the vacuum in the glass.

The manner in which the air is affected may perhaps conveniently be explained by referring, as before, to the action of a drum. Under all the ordinary circumstances of common life, the objects around us are enveloped in the atmosphere, or to a greater or less degree exposed to its action. When the head of a drum is struck, and we reason on the resulting vibration, we must not forget that the air is in contact with it. The parchment assumes a concave form, and the layer of particles of air adjacent thereto follows it in its movement; the second layer (if such a term may be employed) follows the movement of the first; the third of the second; and so on until the original disturbance is propagated to a considerable distance. The rapidity with which this propagation takes place is astonishing, and might appear almost incredible to a person new to the subject. Any disturbance of this kind, to which the air in contact with a vibrating body is exposed, is propagated to a distance of more than eleven hundred feet in one second of time; so that if a drum-head be struck, and thereby set into vibration, the air at a distance of eleven hundred feet from it will be agitated in the following second. If cannon were fired in St. James's Park, the atmosphere at Hampstead would be set into a vibratory state in about a quarter of a minute afterwards; that is, the particles of air immediately surrounding the cannon are disturbed by the explosion, and this disturbance spreads from particle to particle with such rapidity that in about a quarter of a minute it would reach Hampstead, or any place equally distant.

But the particles of air do not continue to move onwards; they oscillate to and fro. When the parchment of the drum recoils, the particles of air in contact with it recoil likewise; and this recoil is communicated from particle to particle as fast as the original disturbance had been, but of course somewhat later in point of time. So likewise in the subsequent vibrations of the parchment: the layer of particles of air adjacent to the parchment follows the movements to which the latter is subjected, and vibrates to and fro with great rapidity; the adjoining particles are in their turn affected in a similar manner; and thus layer after layer—or, if it tends to simplify the conception—particle after particle, is thrown into vibratory states.

The atmosphere is not the only conductor of sound; though for practical purposes it is incomparably the most important. Solids and liquids are also conductors, and in many cases more energetic than air. If we place the ear close to a piece of timber, and a person scratch the other end of the timber with a pin, the sound will

be distinctly conveyed through the wood. If we place the ear near a long brick wall, and the wall be struck at some distant part, two sounds will be heard, the first resulting from the conduction of the blow or disturbance through the solid wall, and the other through the air; showing that the impulse travels more rapidly through the former than through the latter. A bell rung under water, though inaudible in the open air, may be heard by a person whose head is under the water at a considerable distance from it. The ticking of a clock, hanging on a wall in the upper room of a house, may be heard in a lower room by applying the ear close to the wall, when it could not be perceived in the middle of the room. These and many similar instances furnish proof that the vibrations to which the production of sound is attributed, may be conveyed through solid and liquid as well as aerial bodies.

When we state that the vibrations producing sound are propagated from particle to particle with a velocity of more than eleven hundred feet in a second, we allude to the atmosphere only, and not to other media. Experiments have been made, to ascertain the relative velocity of the conduction in different substances; and the results show that the velocity is in some cases greater and in others less than in common air. But into these extensions of the subject it is not necessary for us here to go. Suffice it to say, that the production of audible vibrations, or sound, results from a mechanical disturbance among the particles of an elastic body; and from the conduction of that disturbance, through the atmosphere, to the air immediately surrounding the ear. The consideration of various points connected with the perception of sound will occupy our attention in another paper.

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne*.

OUR BED-ROOMS.—*Useful Hints.*—Their small size and their lowness render them very insalubrious; and the case is rendered worse by close windows and thick curtains and hangings, with which the beds are often so carefully surrounded as to prevent the possibility of the air being renewed. The consequence is, that we are breathing vitiated air during the greater part of the night; that is, during more than a third part of our lives: and thus the period of repose, which is necessary for the renovation of our mental and bodily vigour, becomes a source of disease. Sleep, under such circumstances, is very often disturbed, and always much less refreshing than when enjoyed in a well-ventilated apartment; it often happens, indeed, that such repose, instead of being followed by renovated strength and activity, is succeeded by a degree of heaviness and languor which is not overcome till the person has been some time in a purer air. Nor is this the only evil arising from sleeping in ill-ventilated apartments. When it is known that the blood undergoes most important changes in its circulation through the lungs, by means of the air which we breathe, and that these vital changes can only be effected by the respiration of pure air, it will be easily understood how the healthy functions of the lungs must be impeded by inhaling, for many successive hours, the vitiated air of our bed-rooms, and how the health must be aesthetically destroyed by respiring impure air, as by living on unwholesome or innutritious food. In the case of children and young persons predisposed to consumption, it is of still more urgent consequence that they should breathe pure air by night as well as by day, by securing a continuous renewal of the air in their bed-rooms, nurseries, schools, &c. Let a mother, who has

been made anxious by the sickly looks of her children, go from pure air into their bed-room in the morning, before a door or window has been opened, and remark the state of the atmosphere, the close, oppressive, and often fetid odour of the room, and she may cease to wonder at the pale, sickly aspect of her children. Let her pay a similar visit, some time after means have been taken, by the chimney ventilator or otherways, to secure a full supply, and continual renewal, of the air in the bed-rooms during the night, and she will be able to account for the more healthy appearance of her children, which is sure to be the consequence of supplying them with pure air to breathe.—*Sir James Clark, "On the Sanative Influence of Climate."*

WEATHERCOCKS.

It can scarcely be doubted that means for indicating the winds were invented at a very early period. I must, however, confess that I have scarcely observed any trace of them among the Greeks and the Romans. In Europe the custom of placing vanes on the summits of the church steeples is very old; and as these vanes were made in the figure of a cock, they have thence been denominated weathercocks. In the Latin of the middle ages we meet with the words *gallus* and *ventilogium*. The latter is used by Randolphus, who wrote about the year 1270. Mention of weathercocks occurs in the ninth, eleventh, twelfth, and thirteenth centuries. There is no doubt that the cock was intended as an emblem of clerical vigilance. The English are mistaken when they suppose that the figure of a cock was first made choice of for vanes in the fourteenth century, under the reign of Edward III., in order to ridicule the French, with whom they were then at war.—*Becman's History of Inventions.*

"MANY a marriage has commenced, like the morning, red, and perished like a mushroom. Wherefore? Because the married pair neglected to be as agreeable to each other after their union as they were before it. Seek always to please each other, my children, but in doing so keep heaven in mind. Lavish not your love to-day, remembering that marriage has a morrow and again a morrow. Bethink ye, my daughters, what the word *house-wife** expresses. The married woman is her husband's *domestic trust*. On her he ought to be able to place his reliance in house and family; to her he should confide the key of his heart and the lock of his store-room. His honour and his home are under her protection, his welfare, in her hands. Ponder this! And you, my sons, be true men of honour, and good fathers of your families. Act in such wise that your wives respect and love you. And what more shall I say to you, my children! Peruse diligently the word of God; that will guide you out of storm and dead calm, and bring you safe into port. And as for the rest—do your best!—*Frederica Bremer.*

* In Swedish the word is *Hustru* (i. e. House-troth) which, in its primary sense, signifies house faith—she in whom domestic faith centres.

FRANK FAIRLEGH:

OR, OLD COMPANIONS IN NEW SCENES.

By F. E. S.

CHAP. XV.

THE CATASTROPHE.

I did not return to the cottage till just the usual hour for going to bed, as I did not dare subject myself to Fanny's penetrating glance, in my present state of excitement. The moment family prayers were concluded, I took my candle, and, pleading fatigue, retired to my room. Knowing that sleep was out of the question in my then frame of mind, I merely substituted the clothes I intended to wear in the morning for those I had on, and, wrapping my dressing-gown round me, flung myself on the bed. Here I lay, tossing about, and unable to compose myself, for an hour or

two, the one idea constantly recurring to me, "What if Coleman should fail!"

At length, feverish and excited, I sprang up, and throwing open the window, which was near the ground, enjoyed the fresh breeze, which played around my heated temples. It was a lovely night; the stars, those calm eyes of Heaven, gazed down in their bright effulgence on this world of sin and sorrow, seeming to reproach the stormy passions and restless strife of men, by contrast with their own impassive grandeur. After remaining motionless for several minutes, I was about to close the window, when the sound of a footstep on the turf beneath caught my ear, and a form, which I recognised in the moonlight as that of Archer, approached.

"Up and dressed, Fairleigh?" he commenced, in a low tone, as he perceived me; "may I come in?"

In silence I held out my hand to him, and invited him to enter.

"Like me," he resumed, "I suppose, you could not sleep."

"Utterly impossible," replied I; "but what brings you here—has any thing occurred?"

"Nothing," returned Archer, "Oaklands retired early, as he said he wished to be alone, and I followed his example, but could not contrive to sleep.—I don't know how it is, I have been engaged in an affair of this nature before, and never cared a pin about the matter: but somehow I have got what they call a presentiment that harm will occur. I saw that man, Wilford, for a minute yesterday, and I know by the expression of his eye that he means mischief; there was such a fiendish look of triumph in his face, when he found the challenge was accepted—if ever there was a devil incarnate, he is one."

A sigh was my only answer, for his words were but the echo of my forebodings.

"Now I will tell you what brought me here," he continued; "don't you think that we ought to have a surgeon at hand, in case of anything going wrong?"

"To be sure," replied I; "I must have been mad to have forgotten that it was necessary—what can be done?—it is not every man that would choose to be mixed up with such an affair. Where is it that William Ellis's brother, the man who came up to Cambridge two months ago to see him, has settled?—he told me he had bought a practice somewhere in our neighbourhood."

"The very man, if we could but get him," replied Archer; "the name of the village is Harley End: do you know such a place?"

"Yes," returned I, "I know it well; it is a favourite meet of the hounds, about twelve miles from hence I'll find him, and bring him here—what time is it? just two—if I could get a horse, I would do it easily."

"My tilbury and horse are up at the village," said Archer; "now Harry's horses are at home, they could not take mine in at the Hall."

"The very thing," said I, "we will not lose a moment—is your horse fast?—I shall have to try his mettle."

"He'll not fail you," was the reply, "do not spare time—I would rather have you ruin fifty horses, than arrive too late."

On reaching the inn, we had to rouse a drowsy hostler, in order to procure the key of the stables, and it was half-past two before I was able to start.

The road to Harley End was somewhat intricate, more than once I took a wrong turning, and had to retrace my steps; being aware also of the distance I had to perform, I did not dare to hurry the horse too much, so that it only wanted a quarter to four, when I reached my destination. Here however fortune favoured me. Mr. Ellis, it appeared, being an ardent disciple of Isaac Walton, had resolved to rise at day-break, in order to beguile sundry trout, and at the entrance of the village I met him strolling along, rod in hand. Two minutes sufficed to make him acquainted with the object of my mission, and, in less than five minutes more, (a space of time which I employed in washing out the horse's mouth at an opportune horse-trough, with which I took the liberty of making free,) he had provided himself with a case of instruments, and other necessary horrors, all of which he described to me *seriatim*, as we returned, with an affectionate minuteness for which I could have strangled him.

We started at a rattling pace on our homeward drive, hedge-row and paling gliding by us, like slides in a magic lantern. Archer's horse did not belie the character he had given of him. With head erect, and expanded nostril, he threw his legs forward in a long slashing trot, whirling the light tilbury along at the rate of between eleven and twelve miles an hour; and fortunate it was that he did not flinch from his work, for we had between thirteen and fourteen miles to perform in an hour and ten minutes, in order to reach the

appointed spot by five o'clock. In our way we had to pass within a quarter of a mile of Heathfield Hall; all seemed quiet as we did so, and I heard the old clock over the stables strike a quarter to five.

"We shall be in capital time," said I, drawing a long breath, as I felt relieved from an anxious dread of being too late; "it was a near thing though, and if I had not met you as I did, we should scarcely have done it."

"Famous horse," replied Ellis, "but you've rather over-driven him the last two or three miles; if I were Archer, I should have a little blood taken from him—nothing like venesection, it's safe practice in such cases, as the present; you've a remarkably clear head, Fairleigh, I know; now I'll just explain to you the common sense of the thing: the increased action of the heart forces the blood so rapidly through the lungs, that proper time is not allowed for oxygenization."

"We shall be in sight of the place, when we have advanced another hundred yards," interrupted I, as we turned down a green lane.

"Shall we?" replied my companion, standing up in the gig, and shading his eyes with his hand. "Yes, I see them, they're on the ground already, and, by Jove, they are placing their men; they must have altered the time, for it wants full ten minutes of five now."

"If they have," replied I, lashing the horse into a gallop, as I remembered that this unhappy change would probably frustrate Coleman's scheme, "if they have, all is lost."

My companion gazed at me with a look of surprise, but had no time to ask for an explanation, for at that moment, we reached the gate leading into the field, around which was collected a group, consisting of a gig and a dog-cart, (which had conveyed the respective parties, and a servant attendant upon each, to the ground,) and two or three labouring men, whom the unusual occurrence had caused to leave their work, and who were eagerly watching the proceedings—whilst, just inside the gate, a boy, whom I recognised as Wilford's tiger, was leading about a couple of saddle-horses, one of them being the magnificent black thorough-bred mare, of which mention has been already made.

Pulling up the horse with a jerk which threw him on his haunches, I sprang out, and placing my hand on the top rail of the gate, leaped over it, gaining as I did so, a full view of the antagonist parties, who were stationed at about two hundred yards from the spot where I alighted. Scarcely however had I taken a step or two towards the scene of action, when one of the seconds, Wentworth, I believe, dropped a white handkerchief, and immediately the sharp report of a pistol rang in my ear, followed instantaneously by a second. From the first moment I caught sight of them, my eyes had become riveted, by a species of fascination which rendered it impossible to withdraw them, upon the figure of Oaklands. As the handkerchief dropped, I beheld him raise his arm, and discharge his pistol in the air, at the same moment he gave a violent start, pressed his hand to his side, staggered blindly forward a pace or two, then fell heavily to the ground, (rolling partially over as he did so,) where he lay, perfectly motionless, and to all appearance dead.

On finding all my worst forebodings thus apparently realized, I stood for a moment horror-stricken by the fearful sight I had witnessed. I was first roused to a sense of the necessity for action by Ellis the surgeon, who shouted as he ran past me,—

"Come on, for God's sake, though I believe he's a dead man!"

In another moment I was kneeling on the turf, assisting Archer (who trembled so violently that he could scarcely retain his grasp) to raise and support Oaklands's head.

"Leave him to me," said I; "I can hold him without assistance; you will be of more use helping Ellis."

"Oh! he's dead—I tell you he is dead!" exclaimed Archer, in a tone of the most bitter anguish.
 "He is no such thing, Sir," returned Ellis, angrily; "hand me that lint, and don't make such a fuss; you confuse one."

Though slightly reassured by Ellis's speech, I confess that, as I looked upon the motionless form I was supporting, I felt half inclined to fear Archer might be correct in his supposition. Oaklands's head, as it rested against me, seemed to lie a perfectly dead weight upon my shoulder; the eyes were closed, the lips, partly separated, were devoid of the slightest tinge of colour, whilst from a small circular orifice on the left side of the chest the life-blood was gushing with fearful rapidity.

"Open that case of instruments, and take out the tenaculum.—No, no! not that; here, give them to me, Sir; the man will bleed to death while you are fumbling," continued Ellis, snatching his instruments from the trembling hands of Archer. "You are of no use where you are," he added; "fetch some cold water, and sprinkle his face; it will help to revive him."

At this moment Wilford joined the group which was beginning to form round us. He was dressed, as usual, in a closely-fitting suit of black, the single-breasted frock coat buttoned up to the neck, so as not to show a single speck of white which might serve to direct his antagonist's aim. He approached with his wonted air of haughty indifference, coolly fastening the button of his glove as he did so. On perceiving me, he slightly raised his hat, saying—

"You are resolved to see this matter to its conclusion, then, Mr. Fairleigh: no one can be better aware than you are how completely your friend brought his fate upon himself."

He paused, as if for an answer; but, as I remained silent, not daring to trust myself to speak, he added, gazing sternly at the prostrate form before him,—
 "Thus perish all who presume to cross my path!" then casting a withering glance around, as he marked the indignant looks of the by-standers, he turned on his heel, and stalked slowly away.

"He'd best quicken his pace," observed one of the countrymen who had joined the group, "for there's the man coming as may stop his getting away quite so easy."

As he spoke, the gate of the field was thrown open, and a couple of men on horseback rode hastily in. Wilford, however, as soon as he perceived their approach, made a sign to the boy to bring his horse, and springing lightly into the saddle, waited quietly till they came near enough for him to recognise their faces, when, raising his voice, he said in a tone of the most cutting sarcasm,—

"As I expected, I perceive it is to Mr. Cumberland's disinterested attachment that I am indebted for this kind attempt to provide for my safety; it so happens that you are a quarter of an hour too late, Sir. I wish you good morning."

Thus saying, he turned his horse's head and cantered lightly across the field. The man he had addressed, and in whom though he was considerably altered, I recognised the well-remembered features of Richard Cumberland, paused, as if in doubt what to do; not so his companion, however, who shouting, "Come on, Sir, and we may nab him yet,"—drove the spurs into the stout roadster he bestrode, and galloped furiously after him, an example which Cumberland, after a moment's hesitation, hastened to follow, though at a more moderate speed. Wilford, finding the foremost rider to come nearly up to him, and then, quickening his pace, led him round the two sides of the field; but perceiving that the gate was closed, and men had stationed themselves in front of it to prevent his egress, he doubled upon his pursuers, and putting the mare for the first time to her full speed, galloped towards the opposite side of the field, which

was enclosed by a strong fence, consisting of a bank with oak palings on the top, and a wide ditch beyond. Slackening his pace as he approached this obstacle, he held his horse cleverly together, and without a moment's hesitation rode her at it. The beautiful animal, gathering her legs well under her, faced it boldly, rose to the rail, and, clearing it with the greatest ease, bounded lightly over the ditch, and continued her course on the further side with unabated speed. Apparently determined not to be outdone, his pursuer, whipping and spurring with all his might, charged the fence at the same spot where Wilford had cleared it; the consequence was, his horse rushed against the rail, striking his chest with so much violence as to throw himself down, pitching his rider over his head into the ditch beyond, whence he emerged, bespattered with mud, indeed, but otherwise uninjured. As he reappeared, his companion rode up to him, and, after conversing with him earnestly for a minute or so, turned and left the field without exchanging a word with any other person. During this transaction, which did not occupy one-fourth of the time it has taken to describe, Ellis had in a great measure succeeded in staunching the flow of blood, and a slight shade of colour became again visible in Oaklands's lips.

"He will bear moving now," said Ellis, quickly, "but you must find something to lay him upon; take that gate off its hinges, some of you fellows,—that will answer the purpose capably. Come, bestir yourselves; every moment is of importance."

Thus urged, five or six sturdy labourers, who had been standing round gazing with countenances of rude but sincere commiseration on the wounded man, (for Harry's kind-heartedness and liberality made him very popular amongst the tenantry,) started off, and returned in an incredibly short space of time with the gate; upon this were spread our coats and waistcoats, so as to form a tolerably convenient couch, on to which, under Ellis's direction, we lifted with the greatest caution the still insensible form of Harry Oaklands.

"Now," exclaimed Ellis, "raise him very slowly on your shoulders, and take care to step together, so as not to jolt him;—if the bleeding should begin again he's a dead man. Where's the nearest house he can be taken to? He'll never last out till we reach the hall."

"Take him to our cottage," said I, eagerly; "it is more than half a mile nearer than the hall."

"But your mother-and sister!" asked Archer.

"Of course it will be a great shock to them," replied I; "but I know them both well enough to feel sure they would not hesitate a moment where Harry's life was in the balance. Do you want me for anything, or shall I go on and prepare them for your arrival?"

"Do so, by all means," replied Ellis; "but stay,—have you a bedroom on the ground floor?"

"Yes," returned I, "my own."

"Have the bed-clothes opened," continued Ellis, "so that we can put him in at once; it will save me half an hour's time afterwards, and is a thing which should always be thought of on these occasions."

"Anything else?" inquired I.

"Yes, send somebody for the nearest surgeon; two heads are better than one," said Ellis.

Remembering, as I approached the cottage, that the window of my room, by which Archer and I had quitted it the previous night, would be unfastened, I determined I would enter there, and, proceeding to my mother's door, call her up, and break the news as gently as the exigency of the case would permit, leaving her to get by Fanny as she should think best. Accordingly I flung up the window, sprang in, and throwing myself on the nearest chair, sat for a moment, panting from the speed at which I had come. As I did so, a timid knock was heard at the door. I instinctively cried, "Come in!" and Fanny entered.

"I have been so anxious all night about what you told me yesterday, that I could not sleep, so I thought

"I would come to see if you were up," she commenced; then, for the first time remarking my breathless condition and disordered dress, she exclaimed, "Good Heavens! are you ill? you pant for breath, and your hands and the sleeves of your coat are saturated with water—with—oh! it is blood; you are wounded!" she cried, sinking into a chair, and turning as pale as ashes.

"Indeed, darling, you are alarming yourself unnecessarily; I am perfectly uninjured," replied I, soothingly.

"Something dreadful has happened!" she continued, fixing her eyes upon me, "I read it in your face."

"An accident has occurred," began I; "Oaklands—"

"Stop!" she exclaimed, interrupting me, "the two shots I heard but now—his agitation—his strange manner yesterday—oh! I see it all, he has been fighting a duel!" She paused, pressed her hands upon her eyes, as if to shut out some dreadful vision, and then asked, in a low, broken voice, "Is he killed?"

"No," replied I, "on my word, on my honour, I assure you he is not; the bleeding had ceased when I left him, which is a favourable symptom."

Fanny sighed heavily, as if relieved from some unbearable weight, and, after remaining silent for about a minute, she removed her hands from her face, and said, in a calm tone of voice, "And now, what is to be done? can I be of any use?"

Astonished at the rapidity with which she had regained her self-control and presence of mind after the violent emotion she had so recently displayed, I replied, "Yes, love, you can; the Hall is too far off, and they are bringing him here."

As I spoke these words, she shuddered slightly, but seeing I was doubtful whether to proceed, she said, firmly, "Go on, pray."

"Would you," I continued, "break this to my mother, and tell her I believe—that is, I trust—there is no great danger—and—do that first."

With a sad shake of the head, as if she mistrusted my attempt to reassure her, she quitted the room, whilst I obeyed Ellis's instructions by preparing the bed, after which I unclosed the hall-door, and despatching the gardener's boy to fetch the surgeon, stood anxiously awaiting the arrival of the party. I had not done so many minutes, when the measured tramp of feet gave notice of their approach, and in another instant they came in sight.

A LITTLE TALK ABOUT BUCKINGHAM PALACE.¹

We have thus completed our survey of the eastern front of the palace: its main apartments open into the picture gallery, on the opposite side of which is the western front, comprising a suite of three drawing-rooms, and other apartments. The gallery is about one hundred and eighty feet in length, and twenty-six feet in breadth. It has a semi-Gothic roof, lighted by a triple row of compartments filled with rich diapered ground glass, bearing the stars of all the orders of knighthood in Europe. At each end is a semi-circular arch resting upon coupled Corinthian columns, and communicating with a lobby with an enriched doorway. "The gallery, like that of the Louvre, is long and straight; but, unlike the French picture corridor—that lane of pictures with no turning,—the otherwise monotonous flatness of the walls is broken by the ornamented doorways, which lead to the two suites of apartments east and west. These ornaments are of a chaste character, and present nothing to attract the eye from the paintings hung upon the walls." The settees and chairs are plain, the frames of the pictures are neat rather than gorgeous; in short, there is no rivalry set up, as is too often the case, between the decorator and the painter.

(1) Concluded from page 378.

The roof, or ceiling, is, however, a fine specimen of skilful and elaborate design; yet, as a means of lighting the apartment, its merit is much disputed by artistic critics. Von Raumer, for instance, condemns the immensely high wall which cannot be hung with paintings; and he maintains that the light, coming from above, or two sides, is false, insufficient, and moreover broken by the architectural decorations. "It is to be remarked, that the lighting of the whole of the state apartments has been effected under the most rigid artistic taste. In each of the various drawing-rooms, for instance, the glass is tinted, so as to harmonize with the general tone of the decorations."

Occasionally, this gallery is used as a ball-room; or, shortened by screens, bearing beaufets of superb plate, and priceless articles of *vertu*, in it are given state banquets.

The collection of pictures is very valuable, and comprises, in the main, works of the Flemish and Dutch schools. The chief exceptions are Reynolds's *Death of Dido*, and his *Cymon and Iphigenia*; a landscape by Gainsborough, and a few recent English works; some pictures by Watteau; and an interesting evidence of Titian's versatility—a landscape, with herdsmen and cattle, by that master. Among the finest works are three by Albert Dürer, seven by Rembrandt, seventeen by Teniers, five by Ostade, six by Gerard Dow, nine by Cuyp, eight by Wouvermans, three by Paul Potter, six by Rubens, five by Vandyke, in addition to his various portraits of children. Among Rembrandt's pictures is *The Wise Men's Offering*; among Vandyke's, *The Marriage of St. Catherine*; among Albert Dürer's, *The Miser*; and among Rubens's, the portrait of his wife. Claude's *Europa* also enriches the collection. Its history explains the great number of Dutch pictures: they belonged, for the most part, to George the Fourth, who purchased them from Sir Francis Baring, and was proud enough ever afterwards of his acquisition.

Nor are the arts in Buckingham Palace confined to this gallery; for there is not a room which does not boast of some paintings. Music, also, has its full patronage; there being a grand pianoforte in each of the state rooms, except the throne chamber.

Leaving the picture gallery, we enter, from its centre, the Roman drawing-room, which, because it contains, like the library immediately under it, a circular front, is called, also, "the bow-room." South of this is the yellow drawing-room, and beyond it the state dining-room. Northward of the bow-room is the music-room, communicating with the private apartments of Her Majesty, which extend along the whole of the northern front of the palace.

The most interesting feature of the bow-room, and the drawing-rooms right and left of it, is a series of sculptures in relief, by Pitts, an artist of great promise, who died young. Thus, the frieze in the bow-room represents Eloquence, Pleasure, and Harmony; and in the music-room, within arches of the elliptical ceiling, are three reliefs, representing the apotheoses of the poets, Spencer, Shakspeare, and Milton—each comprising numerous subordinate figures. In the yellow drawing-room, the sculptor has left us a series of twelve reliefs illustrative of the origin and progress of Pleasure: namely, Love Awakening the Soul to Pleasure;—the Soul in the Bower of Fancy;—the Pleasure of Decoration;—the Invention of Music;—the Pleasure of Music;—the Dance;—the Masquerade;—the Drama;—the Contest for the Palm;—the Palm Resigned;—the Struggle for the Laurel;—the Laurel Obtained. The floors of these drawing-rooms are very superb; being bordered with satin and rosewood, inlaid with devices of rose and tulip-wood.

The bow-room has a domed ceiling, enriched with the national emblems, and supported by scagliola lapis-lazuli columns. The music-room has an orchestra gallery at the south end; and for the company are provided brass-framed seats, with velvet cushions. Of the

entire suite, however, the yellow drawing-room is the most superb. It has a lofty cove, richly gilt, and ornamented with heraldic shields, beneath which is the series of bas-reliefs described above; and in these designs there is so much classic beauty that we regret to see the continuation broken by the introduction of medallion portraits, even though they be of royal and illustrious personages. But the main beauty of the apartment lies in the harmony of colour adopted for its draperies, &c.; namely, a series of shades of yellow, ranging almost from brown to green; the effect is truly elegant and artistic, and we remember the like success in the principal drawing-room of the Reform club-house in Pall Mall. Upon the figured yellow silk walls of the palace apartment are hung whole length portraits of royal personages; and at each end, and above the chimney-piece, are placed brilliant mirrors. The chimney-piece is of exquisitely white marble, sculptured by Westmacott. The furniture of the room is truly sumptuous; as is also the assemblage of vases filled with flowers, clocks, bronzes, inlaid tables, cabinets, &c. To quote a contemporary, "all that luxury can desire, or skill and wealth accomplish, to make this apartment magnificent, in the ordinary mode of obtaining magnificence, is to be found here in an extraordinary degree."

We must now sum up the characteristics of the entire pile.

The principal merit, such as it is, lies in the sculptural enrichments of the palace; and the appropriate nationality of their subjects, for the intellectual adornment of the residence of a British sovereign. The marble chimney-pieces, too, are sculptured with caryatides and other figures of life size, and a profusion of fruit, flowers, &c. Yet, the figures are condemned as groups of "pigmies and Brobdignagians huddled together; people from two to six feet high, living in admirable harmony. The smaller figures have such miserable spider legs and arms, that one would fancy they had been starved in a time of scarcity, and were come to the king's palace to fatten."—(*Von Raumer*.)

This acute critic also points out in the same apartment, "fragments of Egypt, Greece, Etruria, Rome, and the Middle Ages, all confusedly mingled together;" and he concludes by asserting "this palace to stand as a very clear proof that wealth, without knowledge of art and taste, cannot effect so much as moderate means, aided by knowledge and sound judgment."

With all these artistical defects and drawbacks, it cannot, however, be denied, that for mere purposes of show and state splendour, the suite of rooms at Buckingham Palace is not ill adapted, now that an additional staircase for egress has been provided. The suite, for convenience, cannot be compared with that of St. James's Palace, which, indeed, has scarcely a parallel in Europe. The rooms of the latter are, however, somewhat heavy in their style of decoration (that of the reign of Queen Anne); there are certain aims at classic elegance, and that of an intellectual character, in the embellishments of Buckingham Palace, which are attractive and interesting, though their success be but fragmentary. The nationality of the sculptures, as we have before said, is one of their redeeming points; and the variety of the styles of decoration is another attraction, though a subordinate one. It is impossible to deny a certain grandeur and beauty to the sculptured marble door-cases and chimney-pieces, with their colossal caryatid figures, their bold scroll-work and medallion portraits; the claim to the originating of all this symphoniousness is somewhat frequently asserted in the royal cyphers G. R. which meet the eye at every available opportunity; and remembering how unsparingly abuse, critical and unartistic, has been showered upon the entire design of the palace, the last of the Georges has not been grudging this distinction by one of the liege subjects of his successors.

Upon no occasion are the gorgeous appointments of the palace so successfully called into requisition as

for the purposes of state balls, two or three of which entertainments are usually given by Her Majesty during the London season. Then, the entire suite of rooms, seven in number, (including the picture-gallery,) is used; and the space beneath the central portico, and over the entrance to the great hall, by aid of Tippee Saib's tent, is formed into a refreshment-room, as we have already described; whilst a similar extension is gained by drapery, in the balcony of the central western or bow saloon. These temporary extensions are set with flowering plants, and thus supply the relief of fragrant coolness. Plants are likewise placed in the picture gallery, where the brilliant bloom of nature thus alternates with the perfection of art. The rooms are mostly lighted by wax; and in cases where lamps are employed, Professor Faraday's beautiful mode of carrying off the heat and smoke by tubes is employed, with increased brilliancy of illumination and perfect ventilation.

There have been two memorable occasions since Her Majesty's accession to the throne, upon which Buckingham Palace presented a scene of almost gorgeous enchantment. These were at the costume balls, or masques, given in 1842 and 1845. The first fête was in the style of the reign of Edward III., the best age of English costume and architecture; so that, in the latter respect, the palace presented, everywhere, an ill-assorted anachronism. In the fête of 1845, the costumes (1740 to 1750) harmonized better with the palace interior. This was the age of hoop and embroidery, brocade and stiffened point lace, high-heeled shoes, powder and patches, such as we see in the porcelain figures of Sevres, Dresden, and Chelsea, and the pictures of Watteau, and Boucher; nor must we forget the equally characteristic male costume of the period—the square-cut coats, and long-flapped waistcoats; the large hanging cuffs and lace ruffles, and stiffened skirts; the long outer stockings, and high-heeled shoes; and the endless wigs, and laced and feathered three-cornered hats—all belong to the exquisite of the time of our second George.

At the ball of 1845, Musard wielded his baton in an orchestra built in the cove of the throne-room, where the graceful minuet was danced; the picture-gallery being appropriated to the more joyous "Sir Roger de Coverley." Supper was served in the great dining-room, where the magnificence of the plate, the brilliancy of the lights and flowers, the elaborate richness of the costumes, and the beauty and noble mien of the actors in this retrospective drama of taste, presented a scene of surpassing splendour. When, indeed, "did morning ever break" to dispel a more delightful illusion than the royal masques of 1842 and 1845.

There are certain points of improved construction in the palace, which we must not lose sight of among its less intrinsic merits. In roofing the edifice, Mr. Nash employed a composition of hot coal-tar, lime, and sand, which has withstood wear and tear much better than his architectural taste; and the floors, formed of cast-iron, arched with hollow bricks, are fire-proof. The offices are, generally, well-appointed; but numbers of blackened supplementary pipes which rise from the roof, seem to indicate that one of the greatest plagues of domestic life, "a smoky chimney," is by no means a rarity at the palace.¹

(1) Immediately under the palace passes "the King's Scholar's Pond Sewer," the main drain of one of the principal divisions of the Westminster Commission of Sewers, occupying the whole channel of a rivulet formerly known as Dye Brook, having its source at Hampstead, and draining an area of 2,000 acres, 1,000 of which are covered with houses. Within a few years, a large portion of this sewer has been reconstructed, under circumstances of extraordinary difficulty; arches of considerable span having been worked to a great extent under densely populated neighbourhoods, without any suspicion on the part of the inhabitants of what was going on a few feet below the foundations of their houses. In its present complete state, it is, perhaps, the most remarkable and extensive piece of sewerage ever executed in this, or any other country.

We shall briefly advert to the works just commenced for enlarging the palace, to meet the requirements of Her Majesty and the royal family. Mrs. Jameson, speaking of the edifice, says:—"George the Fourth had a predilection for low ceilings, so all the future inhabitants of the Pimlico Palace must endure suffocation; and, as His Majesty did not live on good terms with his wife, no accommodation was prepared for a future Queen of England." The first statement is scarcely correct; for the principal floor of Buckingham Palace is by no means of low pitch, and the ground floor is part of old Buckingham House, its retention being rather a matter of necessity than choice. The second statement is truthful scandal; and the palace, accordingly, reminds us of "apartments for a single gentleman," rather than for the enjoyment of married life. Hence the alterations in progress, under the superintendence of Mr. Blore, to meet the cost of which Parliament have voted a large sum. At present, it is understood that the marble arch is doomed to be removed, and a fourth side of the great quadrangle constructed. There has been great objection to the expenditure of more money upon so unsatisfactory a building as the palace has proved; and a new royal residence has been suggested.

THE PALACE CHAPEL,

As we have already intimated, has been adapted by Mr. Blore, from the Southern Ionic Conservatory. The cast-iron framework has been preserved, with open tie-beams of elegant design; and a row of fluted composite columns on each side forms an aisle, which is pewed, the remainder of the area having open seats. The chapel is lit by lofty windows at the sides. Across the west end, and facing the altar, is the Queen's closet, supported by Ionic columns taken from the screen at Carlton House. Here are state chairs for Her Majesty, Prince Albert, the Queen Dowager, and the Duchess of Kent. The fittings of this closet, the pulpit, and reading-desk, are of crimson velvet and gold; and the pews and seats are covered with cloth of this colour. The organ is placed in a gallery, to the right of the altar. The building is coloured throughout white and French white, and relieved by the crimson fittings, has a chastely elegant effect. The chapel was consecrated by the Archbishop of Canterbury, March 25, 1843.

THE ROYAL Mews,

Is a handsome pile of offices entered from Queen's Row, Pimlico, at the rear of the palace. Here are a spacious riding-school; seven large stables; a room expressly for keeping state harness; stables for the state horses; and houses for forty carriages. Here, too, is kept the magnificent state coach, designed by Sir W. Chambers in 1762; and painted by Cipriani with a series of emblematical panel subjects; the entire cost being 7,661*l.* 16*s.* 5*d.* It may be seen by application at the mews; and the stud of horses and the entire establishment may be inspected by application, properly made, to the Master of the Horse.

THE GARDEN PAVILION.

Within the last eighteen months, the palace garden has received a very interesting embellishment, which is closely associated with the patronage and progress of art in this country. Upon an eminence in the garden, looking over the piece of water, is a small cottage, which was selected by Her Majesty and Prince Albert, as the locality in which the experiment of painting in fresco might be made by some of our leading artists. "It may be remembered," says Mrs. Jameson, "that some of the most beautiful examples of Italian decorative art are to be found in garden-houses and the appendages to villas, and that some of the most celebrated compositions in the world were decorative pictures. Raphael's *Galatea*, for instance, is on the

wall of the villa Farnesina; and Guido's *Aurora* is on the ceiling of a summer-house in the gardens of the Rospiigliosi Palace."

For the purpose of this peculiar decoration, the cottage in the Buckingham Palace garden was altered: the external appearance is picturesque and graceful, without any regular style of architecture; it has a sort of minaret roof, and is flanked with a parapet, on which are placed vases with plants. The interior contains an octagonal room, and another apartment on either side: in the basement is a kitchen; and as the apartments have fireplaces, the exterior has the ungenial disfigurement of chimneys.

The octagonal room rises into a dome, sustained and divided by eight ribs; and in each compartment is a circular opening, with sky background—those on the west representing Midnight, with its star; and those on the east, the approaching Dawn. A rich cornice runs beneath, and under it are lunettes, each of which is painted in fresco with a scene from Milton's *Comus*; the painters being Stanfield, Uwins, Leslie, Ross, MacIise, Landseer, Dyce, and Eastlake; seven of whom are distinguished Members of the Royal Academy.

Beneath the lunettes are panels adorned with arabesques, medallions, figures, and groups, from a variety of Milton's poems.

The Octagon or Milton Room opens into a room on the right, decorated in the Pompeian style, "a very perfect and genuine example of classical domestic decoration, such as we find in the buildings of Pompeii; a style totally distinct from the other two rooms."

The room on the left of the Octagon is decorated in the "Romantic" style; the subjects taken from the novels and poems of Sir Walter Scott; richly coloured festoons of flowers; medallions by Pistrucel; statues of children, &c.; and the pavement is bordered with the thistle.

The experiment is considered perfectly successful, and has, unquestionably, accomplished its object—"to offer to some of our artists at once a high motive and a fair opportunity to try their powers in this new old method;" and an excellently illustrated description of the work has been published by command of the Queen, by Mr. Gruner, under whose superintendence the decorations were executed.

Hence, the pavilion has a twofold attraction; and, embosomed in foliage, it presents a delightful retreat in summer. The grounds are otherwise beautifully disposed. Her Majesty and the Prince Consort, when in town, usually take their early morning walk in this charming seclusion; and the royal children participate in its advantages.

ROAD-SIDE SKETCHES OF GERMANY AND THE GERMANS.

In studying the history of Germany, one is continually struck by the sameness which pervades the whole,—by the want of any real radical changes in the principles, in the modes of thought and action, of the nation at large. Incidents are plentiful. In the history of Germany, as of other countries, we have a continual recurrence of wars and rumours of wars; great battles are fought, dynasties are changed, one hero rises, and establishes a dominion, which finally falls before the prowess of another leader as successful. But, whilst these variations take place in the superficial aspect of things, there is no substantial alteration in principle; the great undercurrent remains the same, and, whether we regard it politically, as regards the constitution, or popularly, with respect to the general condition of

society, the progress, *de facto*, is very small and very gradual. It is this fact which makes the history of Germany, comparatively, of so little interest to the philosophical student;—to him who looks only to what may be termed the picturesque side of history, there is much to interest and amuse; but he who reads history as the philosophical record of the progression of society, will find little instruction in the annals of Germany. It is not so with the history of other nations. In France, we can trace the gradual change by which the power, at first vested in an aristocracy, combated by the monarch and the people, and restrained by the Church, was by degrees wrested from the nobles, and at length vested in a despotism, which, growing rotten from long continued prosperity, unbridled by any check, fell before the overwhelming tempest of the revolution. The history of Italy, perhaps more than any other, presents society under continually shifting aspects. Even Spain, though it cannot, like Italy, point to progressive movement as the moral of its history, has its re-conquest from the Mahomedans, its constitutional struggles, its wonderful period of almost universal dominion, and all but irresistible power, to give it interest in the eye of the philosophical student. Our own country has its gradual formation of a constitution, its change from the government of a conquered people by the conquerors, to the claiming of equal rights by the two amalgamated nations; its wars of the roses, in which the power of the feudal aristocracy was lost; its great rebellion, in which the power of the commons was established, and that of the crown curbed; its revolution; its union of the kingdoms of England and Scotland; and so forth. All these are great landmarks in the waste of history,—eras to which we can refer as marking the period at which society put on a new countenance, at which some great change took place in principles and ideas; eras, in fact, which we may style revolutions. But in Germany we find little or nothing of all this; we look in vain for some great event, or some stirring period, to which we may refer, and say,—from this may be dated a great change in the social economy of the country: there are no such landmarks, because, in fact, there never was any such change. Germany has never seen a revolution. From the days of Henry the Fowler, down to the latter end of the last century, there was no real change in Germany as it substantially existed. Even the Reformation, which in other places produced such mighty effects, in England and Scotland almost creating the political movement, and in France and other countries working with it, had, in the land of its birth, no important or lasting influence. The long and desolating war which succeeded, whilst in civilization it threw Germany behind the rest of Europe, at its close left things, in fact, much where it found them. The period which followed was one of utter stagnation; all spirit, national as well as private, seems to have completely died out. Germany, for about a hundred years, is only remarkable now and then as having had battles fought in it; but, as a nation, as a country, its history is a perfect blank. Here then, in the middle of the eighteenth century, we find Germany really very much where it was in the twelfth. It was in fact very much behind the Germany of the middle ages; for, in those days, although the inhabitants were not particularly enlightened, although it was esteemed rather a disgrace than otherwise for any one who considered himself a gentleman to be able to write his own name, or to live by any other means than what we should consider highway robbery; yet the Germans were a nation, keeping up their own customs and principles, and relying on themselves for their own advancement. Whereas, in the eighteenth century, everything like German nationality had become a mere dead letter—everything German was looked on as boorish and vulgar; the national spirit was dead, or, at least, the only symptoms of life were the wretched attempts universally made to ape their neighbours, the French. The very language was looked on by the Germans themselves as

barbarous and incapable of improvement. When I say, then, that the Germany of the eighteenth century was the same as the Germany of the twelfth, I do not mean that there was no outward difference, but that the principle remained the same. It was as in the old legendary tale, where the king and his court remain sleeping in *statu quo* for hundreds of years, though their beards and nails are growing all the time. So in Germany, the people had left off wearing trunk hose and slashed doublets, the nobles ceased themselves in broad cloth instead of armour of plate, and the people were not liable to be hung at the gate of their lord's castle, if he wished for an after-dinner amusement. A few books were printed, and a fewer still were read. But all these important changes may take place, without any real alteration in the character and condition of a nation. And in Germany, the petty princes, the prince-bishops, the free towns, and the microscopically small imperial fiefs, still remained the same. The nobles were still feudal lords, enjoying every absurd privilege and power which a wrong-headed imagination could invent. The burghers of the towns still remained, as of old, fenced in and embarrassed by a set of ridiculously useless and extremely hurtful regulations, which were as injurious as they had once been beneficial; and the peasantry were, in plain words, exactly what they had been in former times—mere serfs, chattels belonging to the land, who were sold along with it, and could not remove from the estate to which they were attached, without the lord's permission. To complete all this, the whole nation was plunged into a sort of lethargic somnolency, much resembling those fits of abstraction in which the great Professor Grossbauch was wont to indulge, when after a dinner of two or three pounds of boiled beef, a corresponding ration of sour kroust, six bottles of march beer, and as many pipes of canaster, he gave himself up (as he said) to the consideration of the knottiest points of Kantian metaphysics, so that the mere turning over of such mighty cogitations in his brain produced a hoarse and rumbling sound, which, issuing mellifluously from the Professor's nose, struck his astonished pupils with mingled awe and admiration.

From this state of lethargy, Germany was roused by Frederick of Prussia; and, though old Fritz was one of the most thoroughly selfish and stony hearted despots that ever filled a throne, he undoubtedly did much for Germany; for he was awake, and wide awake too, and he built a city, and established a monarchy which was really alive. And thus, in spite of himself, (for he had no patriotic feeling of nationality, and looked on a French valet as superior to a German servant,) he benefited the country at large. People began to rub their eyes, to stretch themselves, and wonder they had slept so long. A new spirit arose, and the modern German literature, which, whatever be its demerits, has the advantage of being German, awoke to being. Then came the mighty flood of the French Revolution, and Napoleon's invasions, sweeping away many of the old fences and bulwarks, and rendering necessary a new order of things. Germany was thoroughly roused; it woke to life and activity, and set about doing business in earnest. Here, at length, we have an era and a revolution to date from in the history of Germany.

The outward signs of this peculiarity in the history of Germany, this want of change, are everywhere visible, and the traveller is especially struck by it, in considering the characteristics of the various towns through which he passes. One never sees any traces of a middle period, or transition state, according to the phrase of the day, in their history. The considerable towns have either a sort of bran new, Brummagem appearance, such as Berlin, which was created by the new military despotism, Weimar and Munich, which may be considered to have been produced by the revival of the arts and literature, and the new town of Frankfort and Hamburg, the creations of modern commerce. Or, on the other hand, the towns retain all the characteristics of a period long gone by;

they are mere patched up ruins of the middle ages, such as Ratisbon, Augsburg, and, above all, Nuremberg. These are towns of considerable magnitude and importance, but the smaller ones, those on which the progressive spirit of the age can of course have made less impression, retain, still more, the appearance of their original structure. You have the same antique walls and fortifications, the same heavy low-browed houses, narrow streets and peaked roofs, with gables to the front, which filled the same positions two or three hundred years ago. Nowhere, except in some of the Spanish cities, are the characteristics of the middle ages to be found in such perfection as in these old towns of Germany.

The question then comes to be a very curious one, from what cause it arises, that the Germans should have remained so long stationary in the march of improvement, and why it is that even yet they should be so much behind some of their neighbours—for, in spite of all that has been done of late years, I cannot help thinking that the Germans, as a nation, have not advanced socially and politically, anything like so much as they should, nor anything like so much as they believe themselves to have advanced. They enjoy, one would suppose, many advantages; they are sprung of the same stock as ourselves; they are ingenious, frugal, and laborious to a fault; their country, too, is rich, and abounds in material for improvement; their love of freedom in ancient times was proverbial, and their old institutions were liberal in the highest degree. And now that their eyes are opened, they feel and express an ardent desire for a thorough improvement of everything that is defective in the general system, and see the necessity for genuine practical activity. This is much; but, with all this, I believe that Germany is behind France in real political improvement, and yet the French era of liberty, though not of advance, dates from much the same period as the German era of awakening. What is the cause of this ancient and still continued backwardness in practical advancement? I remember putting this very question to two Germans, men of the highest talents, and most profound learning: "To what cause do you refer it," said I, "that, whilst the Germans and English are in fact the same people, sprung from the same stock, and whilst their original institutions were extremely similar, the latter should have so much outstripped your nation in practical development." The one to whom I first put the query, answered, that the elective form of the German monarchy had been one main agent in retarding improvement: but this, as I said, ought not to have had any such material effect—for, during a long period, our own monarchy was in truth elective, that is to say, the strongest took it, and held it as long as he was the strongest. And in Germany, though the Imperial dignity was nominally elective down to the late war, yet it had been for neat two centuries in reality hereditary, and had been confined to certain families long before that. Nay, more, though the Emperor's title was not hereditary, he was but the mere head, and sometimes only nominally the head, of the various free states, the succession to which had always been hereditary. As this answer then was not satisfactory, I put the same question to my other German friend. The reply which he gave was certainly very free from anything like national pride, and was curious as being characteristic of the metaphysical and far-fetched reasoning of his nation. He said, that he considered the effect as produced by the circumstances of the original invasion of England by Hengist and Horsa. Their expedition attracted and drew away from Germany all the superior and practical spirits of the nation. Those who were left were an inferior class of minds, or at least they were men of less practical and active energetic turn. The descendants of the two parties retained the characteristics of their forefathers. The English were thus superior in practical action: the Germans, being sprung

of a less noble, or at least less enterprising stock, fell behind, and wasted those powers in mere speculative improvement, which should have been directed towards actual advancement.

I was a good deal amused by my friend's historical deduction of hereditary qualities, but at bottom he was not very far wrong—for, in truth, the main cause of the backwardness of the Germans in all matters of practical life, is to be found in their peculiar organization. They never have been a practical people, and I don't laugh if they ever will become so. Even in their richest and most unideal days, when they were most alive to the stern realities of life, their leaders and their governors were foreigners. Charles the Fifth, their greatest emperor, was almost a Spaniard—Wallenstein, their greatest general, was a Bohemian—and, in the present day, many of the leading ministers of the German courts are strangers by blood, whilst the greater part of the commerce of the country is still, as it was in former times, in the hands of the Jews. And the effect of this organization is to verify, in a great measure, Voltaire's saying, "That the English are grown up men, the French children, and the Germans old men in their dotage,"—for they cling with the utmost tenacity to the routine of their old habits, and are uncomfortable at a change, whilst, though, so long as they plot on in the old accustomed track, they make no mistakes and fall into no errors, they appear unable without a very great effort to make any serious alteration in their mode of proceeding. I laughed at the answer given me by a dapper English merchant, of whom I asked, his opinion of the Germans as men of business.—"They are," he said, with an expression of good-natured pity, mingled with some contempt, "good enough sort of people in the way of trade, as long as you don't hurry them, and allow them to go on in their own way. But, Lord bless you, Sir, they have no enterprise, and what's more, they are not ashamed to own it. If you say to one of them, 'such and such a thing would be a good speculation, I wonder you don't try to get up something in that way'—he will answer—'Ah, it's a great deal too hazardous—it would require a very quick, clever man to attempt it—these sort of things suit you English well enough, because you are so clever, but we dare not be so rash—we must just go on in the beaten road.' And so they do go on in the beaten road, Sir, and never dare to take the slightest short cut, or even to put the steam on somewhat higher, and go a little faster, while they are on the road. No, no, Sir, the Germans are an excellent, honest people, and I like doing business with them very much; but they are a slow people, very slow, Sir, and they want enterprise and practical energy.—That's my opinion. And it is extraordinary what a mean opinion they have of themselves—I wonder they're not ashamed to own it. They think there is nothing which the English can't do—but of anything new or difficult, they always say, 'Ah, it's not for the like of us.'" This was the account of a man who had lived long in, and had had much intercourse with, the commercial world of Germany, and my own small experience fully corroborated all that he said—for it must have struck every one who has made the experiments that, however much the Germans in the mass, by their newspapers and their publications, may boast of their perfect ability to cope with England in commercial matters, yet every individual with whom you may converse will candidly avow his sense of the inferiority of his nation to ours, in all practical matters. And the very fact of this timid feeling of inferiority, however strange the avowal of it may appear to us, who generally consider ourselves in every, the smallest point, so infinitely superior to everybody else, and make it a point of good breeding to impress upon every foreigner our sense of his lowly condition,—whilst it is a proof of the undeniable honesty of the Germans, is the strongest evidence of their unfitness for those pursuits with regard to which this timidity exists, for no man will

which he is always fearing that he shall lose. The first step which must be taken; the next must be, to scheme less and do more. They are the most splendid builders of castles in the air,—but, when these imaginary edifices are to be built up of wood and stone, they shrink from the task. Their schemes are frequently most magnificent, but instead of fixing their attention on the important and the essential, they generally run a muck about some trivial detail, leaving the necessary and really beneficial portion to go to the dogs. Thus, when the formation of the Customs' League was exciting so much interest, and well-deserved interest too, for the scheme is one of the most important ever attempted, a point of most grave dispute between the different parties, and one fiercely debated in the newspapers, was the device for the flag which should be borne by the ships belonging to the League—and this before ships, or commerce, or even the League itself, had an existence.

On the whole, however, I doubt very much if the Germans will ever succeed as a practical people. Of late, certainly, they have made a very great change, and a very considerable progress, but that progress has been made exactly because they have turned to those pursuits for which the national mind is by nature best adapted. The high position which Germany now holds amongst European nations is based, not upon commercial greatness, or even military prowess, (for the elaborate military system of the country, of which so much is said, is in truth a perfectly adventitious circumstance, quite foreign to the turn of the public mind,) but upon literary and mental acquirements. Goethe

and Schiller have done more towards elevating the German name, than the victory of Leipzig, or the tariffs of the Zollverein. And, after all, is it not best that things should remain as they are? They have a saying on the Continent, that the English rule the sea, the French the land, and the Germans the clouds—and if this be the case, it is surely far better that each nation should content itself with exertion in that direction for which it is best adapted, without striving for excellence in a department for which it is altogether unfitted. *Ne sutor ultra crepidum* is a very safe rule. For, speaking abstractedly, nations nationally considered are but individuals, now, if every one were to be smitten with the desire to turn tailor, who would get us bread and butter? and, if every one were to turn farmer, the world must go without inexpressibles, which would be, to say the least, embarrassing. In the same way, if Germany is to enter into competition with England in the manufacture of pocket handkerchiefs and tenponny nails, which would appear to have been the peculiar object of Providence in peopling this island, who is to compose waltzes and invent systems of metaphysics? No, no, let the Germans go on publishing editions of the Classics, compiling Oriental lexicons, and writing artistic romances, and leave the matters of the every day world to less intellectual minds. I have a notion, that each nation will succeed better by confining itself to one object, and that, in the end, those objects will be far better attained in this way, than if each goes on the principle of universal rivalry.

Network Castle, on the Yarrow.

Every lover of the poetry of Scott will recollect this picturesque ruin, to be enshrined in the "wood-notes, native, wild," of "The Lay of the Last Minstrel;" and to be, indeed, the *locus in quo* of that charming poem. Although upwards of forty years have rolled away since this successful attempt of the bard "to return to a more simple and natural style of poetry," the locality has a fresh and enduring interest in literary history, over and above the romantic character of the scenery, and its association with chivalrous times.

The river Yarrow, on which stand these famed ruins, flows from the east end of the celebrated vale which bears its name. Of the many Scottish streams which poets have commemorated, the Yarrow is, certainly, one

most worthy of such distinction. We will only glance at the latest, the venerable Wordsworth, who, in these beautiful verses of his, "Yarrow Revisited," gives the following excellent description of the scenery—

"And is this Yarrow? This the stream,
Of which my fancy cherished
So faithfully, a waking dream?
An image that hath perished!
O that some minstrel's harp were near,
To utter tones of gladness,
And chase this silence from the air,
That fills my heart with sadness.

"Yet why?—a silvery current flows
With uncontrail'd meanderings
Nor have these eyes by greener hills
Been sooth'd in all my wanderings."

And through her depths, St. Mary's Lake
Is visibly delighted;
For not a feature of those hills
Is in the mirror slighted.

"Where was it that the famous Flower
Of Yarrow Vale lay bleeding?
His bed, perchance, was yon smooth mound
On which the herd is feeding:
And, haply, from this crystal pool,
Now peaceful as the morning,
The water-wraith ascended thence,
And gave his doleful warning.

"Delicious is the lay that sings
The haunts of happy lovers;
The path that leads them to the grove,
The leafy grove that covers;
And pity sanctifies the verse
That paints, by strength of sorrow,
The unconquerable strength of love:
Bear witness, rueful Yarrow!

"But thou, that didst appear so fair
To fond imagination,
Dost rival, in the light of day,
Her delicate creation:
Meek loveliness is round thee spread,
A softness still and holy;
The grace of forest charms decay'd,
And pastoral melancholy.

"That region left, the vale unfolds
Rich groves of lofty stature,
With Yarrow winding through the pomp
Of cultivated nature;
And, rising from these lofty groves,
Behold a Ruin howry!
The shatter'd front of NEWARK'S TOWER,
Renown'd in Border story!"

"Further down the vale," says the *Picturesque Tourist in Scotland*, "is the village of Yarrowford, near which are the remains of the strong and venerable castle of Hangingshaw, one of the possessions of the outlaw Murray, and, till within these few years, of his descendants. It stood in a romantic and solitary situation, and was the scene of the beautiful old ballad, called, 'The Song of the Outlaw Murray.' " The *Tourist* adds, by way of note, "the scene is, by the common people, supposed to have been the castle of Newark; but this is highly improbable, as Newark was always a royal fortress; and Mr. Plummer, who, at one time, held the office of sheriff-depute of Selkirkshire, assured Sir Walter Scott that he remembered the *insignia* of the unicorns, &c., so often mentioned in the ballad, in existence upon the old tower at Hangingshaw. The house was burnt down, by accident, about seventy or eighty years ago, to the great grief of the people, who loved the proprietor on account of his numerous virtues. As a trait of the hospitality practised at Hangingshaw, it is recorded by tradition, that whosoever called at the house, was treated with a draught of stout ale from a capacious vessel, called 'the Hangingshaw ladie.' "

When the mountains around Hangingshaw were covered with a wild copse, which constituted a Scottish forest, a more secure stronghold for an outlawed baron can hardly be imagined. A little beyond is the modern mansion of Broadmeadows; and a mile below are the romantic ruins of NEWARK CASTLE, standing on an eminence overhanging the Yarrow, with dark wooded hills rising closely around on both sides. Turner has chosen this locality as one of his charming vignette illustrations of the poetry of Scott; and his fascinating pencil has invested the subject with all the graces of art. The spot is about three miles from Selkirk; and, at about a mile below, the fierce and precipitous stream unites with the Ettrick.

Newark, as we have said, was always a royal fortress. Turner's sketch, taken in 1831, shows it in a more perfect state than our illustration, though it was then

but a massive tower, unroofed and ruinous, surrounded by an outer wall, defended by round flanking turrets. It is now the mere shell shown in our engraving.

The castle was built by James II.; and the royal arms, with the unicorn, are sculptured on a stone in the western face of the tower. There was a much more ancient castle in its immediate vicinity, called Auld-wark, founded, it is said, by Alexander III. Both were designed for the royal residence, when the sovereign was disposed to take his pleasure in the extensive forest of Ettrick. Various grants occur in the records of the Privy Seal, bestowing the keeping of the castle of Newark upon different barons. Upon the marriage of James IV. with Margaret, sister of Henry VIII., the castle, with the whole forest of Ettrick, was assigned to her as a part of her jointure lands. But of this she could make little advantage; for, after the death of her husband, she is found complaining heavily that Buccleuch had seized upon these lands. Indeed, the office of keeper was latterly held by the family of Buccleuch, and with so firm a grasp, that when the forest of Ettrick was disparked, they obtained a grant of the castle of Newark in perpetuity. The court-yard of the castle was once the scene of a strange story of blood. Not very far from hence is the plain of Philiphaugh, the scene of the defeat of Montrose, by General Leslie, 13th September, 1645; and, after the battle, Leslie caused a number of his prisoners to be executed in the castle court, in cold blood. The spot where this atrocious deed was perpetrated is still called "The Blain Men's Lea."

The castle continued to be an occasional seat of the Buccleuch family for more than a century; and here, it is said, the Duchess of Buccleuch and Monmouth was brought up. For this reason, probably, Scott made it the scene in which "The Lay of the Last Minstrel" is recited in her presence, and for her amusement. The reader will recollect the introduction of the Minstrel—

"He pass'd where Newark's stately tower
Looks out from Yarrow's birchen bower:
The Minstrel gazed with wishful eye—
No humbler resting-place was nigh.
With hesitating step, at last,
Th' embattled portal arch he pass'd,
Whose ponderous grate and massy bar
Had off roll'd back the tide of war,
But never closed the iron door
Against the desolate and poor.
The Duchess marked his weary pace,
His timid mien, and reverend face,
And bade her page the menials tell,
That they should tend the old man well:
For she had known adversity,
Though born in such a high degree;
In pride of power, in beauty's bloom,
Had wept o'er Monmouth's bloody tomb."

It will be recollected that Anne, Duchess of Buccleuch and Monmouth, was representative of the ancient Lords of Buccleuch, and widow of the unfortunate Duke of Monmouth, who was beheaded in 1685.

At the time when "The Lay" was composed, Bowhill was the favourite summer residence of Lord and Lady Dalkeith, (afterwards the Duke and Duchess of Buccleuch), and the ruins of Newark are all but included in the park attached to this modern seat of the family. Sir Walter Scott was, no doubt, therefore, influenced in his choice of the locality, by the predilection of the charming lady who suggested the subject of his "Lay," for the scenery of the Yarrow,—a beautiful walk on whose banks, leading from Bowhill to the old castle, is called in memory of her, "The Duchess's Walk."

Opposite Newark is the farm of Foulshiels, where Mungo Park, the celebrated African traveller, was born. Bowhill stands further down, at the mouth of the vale, on the right, on the face of the eminence, embowered amidst its beautiful woods; and on the left is Philiphaugh House, situated on a hill, looking

over Carterhaugh and the confluence of the Ettrick and Yarrow; by which the road passes, and enters the town of Selkirk.

Scott's own account of the origin of "The Lay" is very interesting. The Poet had scarcely made up his mind to use "the measured short line, which forms the measure of so much minstrel poetry, that it may be properly termed the Romantic Stanza." He was, however, "at a loss for a subject which might admit of being treated with the simplicity and wildness of the ancient ballad. But accident dictated both a theme and measure, which dictated the subject, as well as the structure of the poem." The lovely young Countess of Dalkeith, afterwards Harriet, Duchess of Buccleuch, had come to the land of her husband, with the desire of making herself acquainted with its traditions and customs, as well as its manners and history. Of course, where all made it a pride and a pleasure to gratify her wishes, she soon heard enough of Borderlore; among others, an aged gentleman of property, near Langholm, communicated to her ladyship the traditional story of Gilpin Horner. The young Countess, much delighted with the legend, enjoined on Scott as a task to compose a ballad on the subject—of course, to hear was to obey. His triumph was complete; and among those who smiled on the adventurous minstrel, were numbered the great names of William Pitt and Charles Fox. Upwards of 30,000 copies were sold; so that this was one of Scott's most brilliant as well as earliest successes. Its culminating point lies some six miles from Newark, where, upon a bank overhanging the Tweed, is the romantic home of the Poet and Novelist—Abbotsford, one of the most interesting shrines of genius at which man delights to pay homage to his species.

THE WISH.

A FAIRY TALE.

CHAPTER I.

A GREAT many years ago, before railroads and stage coaches had chased the fairy people from the green meadows and smooth lawns, where they loved to sport beneath the soft light of the moon,—and from the shady groves, and sequestered glens, where they were wont to repose, during the long summer's day, cradled within the bell of the modest cowslip, or the fragrant honeysuckle,—and before Sunday schools, and national schools, and infant schools, had driven them from their homes in the hearts and imaginations of England's simple peasantry;—in those days when the active industrious maiden would, on awaking in the morning, find "a tester in her shoe," and the lazy sloven who had been sleeping when she ought to have been working would be "pinched black and blue;"—when joy was often turned to grief, and mourning to gladness, by fairy agency; there lived in a village in the west of England a young man named Robert, or as he was commonly called, Robin Maynard. He was the son of poor parents who died when he was very young. But the little orphan was not deserted, his uncle William Maynard received him under his humble roof, and brought him up with a father's care.

Robin was taught to read and write at the village school, and, as soon as he was old enough to work, his uncle began to instruct him in his own trade, which was that of a shoemaker.

As Robin was a clever industrious lad, he was able in the course of a few years to be very useful, and, by his

attention and diligence, to make some return for the kindness which he had received from his uncle during the years of his helpless infancy. William Maynard was very fond of his nephew, and loved to look forward to the time when he would be a comfort and support to his old age. But this time was never to arrive. William was taken suddenly ill; earthly help was vain, and, before many days had elapsed, Robin followed to the grave the remains of his kind uncle.

It is a sad feeling to awake in the morning with an undefined sensation of grief lying cold and heavy at the heart, and gradually, as the memory awakens, and the perceptions become more clear, to feel, as the mournful truth presents itself by degrees to the mind, that the dreams of the night, gloomy though they were, were not so dark as the sad reality.

Such were the feelings of Robin when he opened his eyes, and gazed around the desolate apartment, on the morning after his uncle's funeral. He had lost all that was most dear to him in this world, and he felt that he was indeed alone.

But he was not of a disposition to give way to useless despondency. He thought how much cause he had to be thankful, that so kind a friend had been spared him for so many years, and he felt more than ever grateful to that friend for having brought him up in habits of industry and self-denial.

Robin now set himself seriously to consider his present situation, and to arrange his plans for the future. He was nineteen years of age, strong and active, and an excellent workman; he certainly was but young to commence business for himself, but yet he did not despair of success: he trusted that his uncle's old friends would not desert his nephew, and he resolved it should not be his fault, if those who employed him were not satisfied. He soon found his best hopes realized; he was honest and obliging, and moreover he was the only shoemaker in the village. It is not, therefore, to be wondered at that work came in rapidly.

Now Robin was not only a very good workman, but he was also a very good-looking young man. His figure was tall and well proportioned, and he had a bright eye, and white teeth, and dark hair which fell in rich curls over a smooth open forehead, and, as he sat by his cottage door, on a summer evening, singing at his work, it may readily be supposed, that many a bright eye peeped from beneath its dark fringe, and many a rosy lip disclosed the pearly teeth within, as it parted in a smile of greeting to the handsome young shoemaker, as the village maidens passed and repassed, on their various errands of business or pleasure. Robin had a sunny smile and a merry jest ready for all, but, after they were gone, he returned to his work and his song, with a heart as light and as free as ever. Yet there was one gentle quiet girl, perhaps the only one who took no notice of Robin, and, probably for that very reason, because she did not look at him, he was particularly anxious to look at her. But this is not a love story, therefore the sooner we come to an end of this part of our tale the better. Suffice it to say, that "where there is a will there is a way," and Robin's will was to become acquainted with the pretty Alice and to make her his wife. All this in due time he accomplished.

And now, instead of sitting alone in his porch on a summer's evening at his solitary labour, Robin had a pleasant companion always with him, to lighten his toil with her cheerful conversation. And, while he worked with his awl and his last, she would sit by his side, and ply her needle with skilful busy fingers.

CHAPTER II.

Robin and his wife were very happy; they loved one another, and they were general favourites amongst their neighbours, and Robin's business went on prosperously.

But clouds will arise in the brightest sky. After they had been married nearly a year, an infectious fever broke out in the village. Alice, who had recently become a

mother, and could not leave the house at the time, escaped the disorder; but Robin, trusting too much to the strength of his constitution, would not be persuaded to take precautions. He went constantly to the houses of his sick neighbours, bringing them such assistance as his own slender means would allow him to give; and, in some cases, where the nurses had fallen victims to the disease, and others were afraid to undertake the dangerous office, he remained night and day in attendance upon the sufferers. At length his strength failed, and he was seized with a violent attack of fever.

For many days there appeared to be scarcely a hope of his recovery. At length, however, the disorder took a favourable turn, but he was reduced to such a state of weakness, that his life seemed but to hang upon a thread.

Weeks, months passed away, and still Robin was feeble and weak, and quite unfit for any exertion, either mental or bodily. During the time of suffering and danger, Alice's thoughts were too much occupied with the dread of losing her beloved husband, for any other fear to enter her heart; but, now that his life was no longer in danger, and she could direct her attention to outward circumstances, sad truths began to force themselves upon her mind.

For months, Robin had been unable to work; consequently, for months he had earned nothing. All the little he had saved during his prosperity had been spent in relieving the wants of his sick neighbours; and now there was a doctor's bill, and house-rent, to be paid, and nothing to pay them with. They sold all they could possibly spare of their furniture, and even their clothes, to pay the doctor. Their landlord waited,—as long as most landlords will wait for a poor tenant; that is, till he could get a better—and then he told them he should take possession of their remaining furniture for his rent, and that they must quit his house that day week.

It was on the eve of the day on which Robin and his wife, and their helpless babe, were to be cast homeless wanderers on the wide world. It was also on the eve of the first anniversary of their wedding-day. They sat together before the dying embers of a wood fire; it was a gloomy evening in November; the rain beat heavily against the casement, and the wind howled through the leafless boughs; and Robin shuddered as he looked at his gentle Alice and her babe, and thought of the morrow. They were silent, for they had only sorrow to speak of, and each feared to add to the grief of the other, by giving utterance to sad thoughts. Alice was slowly rocking the cradle of her sleeping infant with her foot, and, as she looked on its calm peaceful little face, large tears coursed one another down her pale cheek. She was startled from her melancholy reverie by a sudden exclamation from Robin—

"I have found it out, Alice! I have found it out!" he cried, as he snatched a burning brand from the hearth, and held it so as to throw its red light upon the part of the floor immediately before the place where he sat. Alice gazed at him as if she thought his troubles had turned his brain. But what that was which he had "found out," must be reserved for another chapter.

CHAPTER III.

THE floor of the cottage in which Robin Maynard lived, was paved with large flat stones, and on one of these was an inscription, which not only had the simple occupants of the cottage failed to decypher, but which had been proof against the united learning of the school-master and the parish-clerk. It was as follows:

"Li. Fam. Sup. Andy. O. Us. Ha. Lis. E. E.

"Wh. Ati. Shi. Dd. Enu. Nde. Rm. E."

As Robin's eye wandered vacantly over the floor, his glance had been suddenly arrested by the appearance of these letters. He had often pondered over them before, in vain; but now, they seemed all at once to arrange themselves into words.

"Look here, dear Alice," he said; "look at these letters; I have found out their meaning. See, you must spell them straight on, without minding the divisions, and only stop when you find that they form a word; thus L I F T spells *lift*, and so on; and you will see it makes—

"Lift me up and you shall see

"What is hidden under me."

"Now depend upon it, Alice, there is a treasure concealed under this stone."

"At all events, dear Robin, it is worth while to raise the stone and see," replied Alice, though she did not appear quite so sanguine as to the result as her husband.

Robin began immediately to remove the earth from round the edges of the stone with his knife; and then, with the help of the iron bar, which he took from the window-shutter for the purpose, he succeeded, at length, in displacing the heavy stone.

An exclamation of delight escaped from his lips as he did so, for he beheld underneath a small trap-door of iron, with an iron-ring in the centre of it. "Now for the treasure, Alice!" he exclaimed, as he seized the ring, and pulled at it with all his might. But almost before the words were uttered, he fell to the ground, almost blinded and almost suffocated. The trap-door had yielded at once to his touch,—thus the violence of the effort had caused his fall; his momentary suffocation and blindness were occasioned by a tremendous gust of wind, laden with dust and sand, which rushed through the aperture.

Robin soon recovered his presence of mind, and, clearing the blinding dust from his eyes as well as he was able, he gazed around, with wonder not unmixed with awe.

The room, which, a moment before, was in utter darkness, for the wind had extinguished the blazing wood, was now filled with a soft yet brilliant light. It was not moonlight, it was too bright; it was not daylight, it was too soft and silvery; it was a pure, unearthly radiance, which pervaded the whole apartment, and in the centre there stood a figure.

It was that of a man, aged, but not decrepid; his height did not exceed one cubit, his form was of the most perfect symmetry; his countenance was calm and beautiful, and his long white hair fell in soft ringlets over his shoulders. He was clad in a tunic of bright green, which descended in graceful folds to his feet, and was confined at the waist by a zone of sparkling diamonds, from which proceeded the light that streamed through the apartment. In his right hand he held a small wand, and the other was raised, as if to command attention.

Robin and Alice remained in breathless silence, waiting till their wonderful visitor should speak. Presently his lips moved, and in a soft low kind of chant, he uttered these words,

"Mortal, thou hast sought me, thou hast found me; what is thy will?"

"Who, and what art thou, beautiful stranger?" said Robin.

"I am thy guardian fairy; I was present at thy birth; my protection was invoked by thy dying parents, and I have watched over thee ever since."

"And why, kind fairy, have I not beheld thee before?"

"Because thou hast not before stood in need of my aid; I know thy wants; I know that thy sorrow has not been brought on by sin or imprudence; therefore I am here to assist thee."

Robin would have expressed his gratitude, but the fairy again raised his hand in token of silence, and proceeded,—

"It is in my power to grant thee three requests; one at the present time; the other two, on the same day, and at the same hour, two successive years. But, beware! There is one wish forbidden, and shouldst thou ask that, all which thou hast gained before will be lost,

and my power to grant any further wish of thine will be gone."

"And what," inquired Robin, "is this forbidden request? Tell me that I may avoid it."

"I may not tell it," replied the fairy; "but I will give thee a rule, by following which thou wilt be in no danger. It is this, '*Be moderate in thy desires, and do as thou wouldst be done by.*' Attend to this, and all will be well. Name thy first wish."

Robin considered for a moment, and then said, "Give me wealth sufficient to support myself and family in ease and comfort, and to enable me to relieve the wants of those who suffer, as I have done, from poverty."

The fairy's brilliant girdle beamed yet more brightly, and a smile of satisfaction illumined his countenance, as he said, "'Tis well! thy wish is granted. Farewell." And the light gradually faded away, and the beautiful being seemed to dissolve itself into darkness.

"Was it only a dream?" said Robin.

Alice struck a light, and they looked, first at one another, and then around the gloomy apartment. No change was visible, the large stone had returned to its place, and bore no trace of having been disturbed, and the inscription looked as unintelligible as ever.

"Was it but a dream? No, it could not be a dream," added Robin; "and yet I thought the fairy would show us a treasure, or tap our cottage with his wand, and change it into a nice comfortable house, or something wonderful of that kind, as fairies usually do."

"So did I, dear Robin; but let us trust him; he was so beautiful, and looked so good, I feel sure he will not deceive us. Let us go to rest as if nothing had happened, and we cannot tell what to-morrow may bring forth."

Robin sighed, as he thought what the morrow would but too probably bring forth; however, like a wise man, he followed his wife's advice.

CHAPTER IV.

It was daylight, the clouds and storms of the preceding night had given place to a bright and beautiful morning, and, as the beams of the rising sun shone upon Robin's closed eyelids, he awoke. He gazed around him—he closed his eyes—he opened them again—he looked once more;—yes, he was indeed awake. Yet, could it be real? There he lay on a soft bed of down, hung with rich curtains of many-coloured tapestry, in a spacious and luxuriously-furnished apartment; and there was his dear Alice sleeping peacefully by his side. The fairy had not deceived them. "Wake up, my love!" cried Robin joyfully, "wake up and see what the fairy has done for us."

So, indeed, it was. They found themselves transported into a delightful mansion, with everything around them that moderate wealth could supply, or moderate wants require.

Robin drew aside the heavy folds of the curtain, and, putting on a dressing-gown and slippers, which lay ready for his use, he walked to one of the windows, and looked forth. Below him lay a beautiful garden, with its closely-shaven lawns, smooth gravel walks, and beds filled with the choicest flowers; for, though the autumn was far advanced, the house and grounds lay in such a warm, sheltered nook, with hills on the east, and woods on the north, that the summer seemed to linger there as if it loved the spot; and the sun still called forth, with his genial rays, the fragrant breath of many a sweet-scented flower. When Robin had admired the lovely garden, and gazed at the pleasant landscape beyond, he turned to examine more minutely the wonders within. On his right hand he saw a door, on opening which he found himself in a dressing-room, fitted up with everything needful for a gentleman's toilet. On one side was a wardrobe; filled with clothes of all descriptions; there were great-coats and little-coats, dress-coats and plain-coats, piles of snowy linen, and whole regiments of boots and shoes, which he

examined with the eye of a critic, and pronounced most excellent.

When Robin and Alice met, after they had both completed their morning's toilet, they were at first so astonished at the alteration in each other's appearance, that they could not find words to express their admiration. Alice had been lovely in her husband's eyes in the coarse and toil-worn garb of poverty. Now he beheld her radiant in smiles, her graceful figure displayed to the utmost advantage by a closely-fitting robe of dark silk, and her soft cheek, looking softer still, shaded by the rich lace of her morning cap, which confined, without concealing, the luxuriant tresses of her golden hair; and, as Robin embraced her, he thought her lovelier than ever—dearer she could not be!

CHAPTER V.

At this moment Robin and his wife heard tap—tap—tap on the floor, just behind them, and, looking round, they beheld their friend the fairy.

"Mortal," he said, "I have visited thy world again, because there are some things of which it is necessary I should inform thee. Know then, that, foreseeing what thy first wish would be, I had, before I appeared to thee, purchased this mansion, and all belonging to it, from its owner, in thy name. I placed servants here, and yesterday, assuming thy form, I took possession of it; therefore thy arrival here will excite no surprise amongst thy fellow mortals. Now follow me." The fairy pointed to a particular fold of the rich tapestry, with which the walls of the room were hung, and desired Robin to draw it aside. He obeyed, and beheld a small door of carved oak; the fairy presented him with a key, and bade him unlock it. He did so, and it flew open; beyond he saw, at the end of a short passage, a stone, bearing the same inscription as that in the cottage; at his approach it slowly raised itself, disclosing a flight of steps. The fairy descended, and Robin followed, lighted by the brilliant girdle; another door opened, and Robin found himself in a small vaulted chamber, in which stood ten empty chests; the fairy struck each in succession with his wand, and it was filled with gold coins. Robin's eyes sparkled with delight, but he restrained the strong inclination which he felt to fill his pockets, and the fairy again spoke,

"Behold," he said, "all this is thine. Use it, but do not abuse it; and, on the next anniversary of the wedding-eve, as the clock strikes twelve, thou shalt find me here. I shall then replenish these coffers, and I shall be ready to grant thy *second wish*."

As he concluded these words the fairy disappeared, and Robin, with some difficulty, groped his way back to the room he had left.

Here he found Alice waiting for him, and they proceeded down stairs. A door was open, and, entering, they found themselves in a well-furnished breakfast parlour; a cheerful fire burnt in the grate, and on a table lay preparations for a repast, which, when we consider that they had had but a slender dinner, and no supper the day before, we may suppose was far from an unpleasant sight.

Whilst the servant was placing on the table all the et cetera which, in those days, were required to complete a substantial morning meal, Robin had been standing at a door which opened out on the lawn, again admiring his beautiful garden, and inhaling the delicious perfume of the roses which clustered round the trellised porch; suddenly he exclaimed,

"Look, Alice, it seems we are not the only inhabitants of this place; see, there is a nurse and child in the garden; and walking about as if they had a right to be there," he added, rather discontentedly.

Before he had finished speaking, Alice had sprung through the open door, and was pressing the infant to her bosom, and covering it with kisses. The mother's heart had told her what a father's eye had failed to discern. It was her own babe, as much changed for the

better, in outward appearance, as its parents; but, in the midst of all the lace and embroidery, one glance had discovered to her that it was her own dear little Robin.

This was all that was wanted to complete the happiness of both parents, and they sat down to their breakfast with thankful hearts.

After breakfast was over, Robin and Alice proceeded to examine their newly-acquired possessions. Whilst Alice was wandering from room to room, admiring one thing, and trying to discover the use of another, amongst the costly and elegant luxuries with which she was surrounded, and bestowing due praise upon all the household arrangements, Robin visited the stable, tried the horses, and explored his delightful gardens and pleasure grounds, from one end to the other.

(To be concluded in next Number.)

LIFE AND CHARACTER OF JOHN FOSTER.

THE death of a famous orator, statesman, philosopher, or poet, is frequently compared to the setting of the sun, the extinction of a star, or to some solemn eclipse stealing over the nations. The poetic mind feels no impropriety in such comparisons, but rather sees a high truth and striking significance in these passionate figures of the heart, as, standing by the quiet grave of some child of genius, it meditates over the loss which this world has sustained.

The lover of nature often gazes upon the receding splendours of the setting sun, as cloud after cloud loses the gorgeous tintings, and the highest peaks of a Chamouni or a Blanc reflect the last faint rays. The observer may hope to see again such revelations of material beauty; but, when one of those great lights of the mental world—a deep thinking, and far seeing man—disappears, we can look for no return, no rising on the morrow, with a renewed splendour.

Astronomers call our attention, at certain times, to the extinction of some star long chronicled on the sidereal catalogue, and men speculate on the mysterious disappearance of the remote companion of the heavenly host; but how often are we startled by the notice of other disappearances—the deaths, of the great and wise, whose names have been to us words of mighty power!

The men whose thoughts have kindled within us the aspirations of a spiritual nobility, whose precepts have sounded in our ears like voices from some holy shrine, should not retire from our view into the hidden depths of the surrounding world, without inducing a momentary pause from the tumult and the din of life. Whilst the tolling bell announces their departure, we must reverently turn aside from the dusty and beaten tracks of daily business, to gaze upon the departing symbols of intellectual or moral greatness. The death of "John Foster the Essayist," and the publication of his Correspondence and Diary, have suggested these reflections.

Many however may inquire, Who, or what, was John Foster? For it must be confessed that he, the profoundly meditative man, was not spoken of in populous haunts of men, nor fixed on high before the gaze of the great multitude. Like some distant and remarkable

star, only seen by the astronomer who quietly watches its appearance, so Foster was not "the observed of all observers," but the prized friend of the contemplative, and the loved teacher of many whose understandings have been disciplined by his wisdom and eloquence. These now turn, with many a rich remembrance, to the place where last his voice was heard lamenting over human evils, or filling with powerful suggestions the minds of all within that circle over which his influence exercised a poetic power. But, as this original thinker is so little known, even to very many of those who deem themselves versed in modern literature, some notices of this remarkable man, the character of his writings, the peculiarities of his mind, and the influence exercised by his works, may justly claim our present attention.

Who then was John Foster? The outlines of his life may be given in few words, for he was a retired and thoughtful man, loving the gentle shadows of the world's twilight, and shrinking from that glare of publicity so delightful to thousands. He saw from his quiet retreat at Frome, or Stapleton, the distant bustle on the highway of life, marking the dusty clouds raised by the excited hosts in their race for honour or gain. The crowd passed on, thinking little of him who, pen in hand, was observing and noting the caprices, follies, and weaknesses of men, but actuated by no desire of mingling with the throng. That he was little known to the "million" excites no surprise, though it may occasion many regrets that struggling men should be cut off from the invigorating and original thoughts abounding in his writings.

But it may happen that many of those who have never formed a close acquaintance with Foster as an author, desire to know something of a man whose name they have heard uttered with loving respect by men of the highest abilities. Let such persons first accept the following summary of his life, and then follow us in a brief survey of his intellectual and moral character.

John Foster was the son of a poor Yorkshire weaver and farmer, for, strange as the union may appear, he followed both pursuits; and, as if these occupations were insufficient, added the scarcely definable labours of an occasional preacher. The reader will infer from this last statement that the father of the essayist was a dissenter, and, we may add, held the notions of the Baptists. This fact will explain some peculiarities in the character of the son, who, being educated in the midst of a narrow circle, inevitably contracted certain eccentricities, which often obstructed the brightness of his genius.

On the 17th of September, 1770, John Foster was born, in a small house, in the parish of Halifax, and there he grew up during fourteen years, exposed to all the unpoetic influences of the spinning-wheel, and the labours of a manufacturing people. The circumstances of his father rendered the help of his children desirable, and the future writer was early placed at the spinning-wheel, to extract from its hum such associations as fancy might form in the susceptible mind of such a boy. The beautiful forms of the imagination's universe appear, even then, to have had more attractions for Foster than the money-getting loom or wheel, to neither of which he applied with sufficient earnestness to secure a pre-eminence in handicraft. The manufacturer who employed Foster's father used frequently to complain of the condition in which the work was brought to the "taking-in room," upon which occasion the boy was accustomed to "turn his head aside," as if shrinking from the close inspection of the material, and the sharp censures of the foreman. Whenever time would permit, he stole into some sheltered nook, far from the sound of wheels and looms, where, listening to the ripple of the stream, as its waters fretted against the gnarled roots of ancient trees, which had for centuries sheltered the winding banks, he suffered his imagination to wander far into the depths of thought's limitless sea. The isolation of the boy was, it may be supposed,

extreme, for, amongst the spinners and weavers of Yorkshire, few could sympathise with one whose mind was ever communing with the ideal and the grand. His father, a precise Baptist, had little appreciation of the powers working in his son's mind, though he seems to have been, for his station, a superior man, and did not, therefore, discourage the speculative habits of his child. Sometimes the youth would take his bowl of milk, and hurry to a secluded nook when the sun was setting, and there watch the changing colours of the sky, and the long shadows from the tall trees; and gaze with ecstatic delight on the rich tints of the autumn woodlands. Thus some spirits ripen into greatness, where no human eye marks the silent development of genius, as, struggling through the mist, it seeks the highest regions of truth and knowledge.

Foster's father being a dissenter, the son was naturally led to adopt the same habits and modes of thinking; and, as he never seized a thought by halves, held to his principles with no little pertinacity. At Hebden-bridge, near his birth-place, was a Baptist chapel; thither the young Foster resorted for religious services, and soon attracted the observation of certain educated members of the society, who began to think that so acute a mind might do good service to their sect, by developing its principles, and vindicating its pretensions. "Will not young Foster make a good preacher?" was now the point to be settled; and in quick time it was decided that he would. He was, therefore, called by his friends to decide upon the proposal now laid before him; and none will be surprised to see the young Foster adopt a plan which promised that culture of the understanding, and that communion with elevating subjects, for which he longed. Little did his sanguine friends imagine the kind of mind they were now drawing from its deep obscurity. To make a Baptist preacher was their object; but in this respect they were woefully disappointed, as Foster was most unfitted for such an office, and opposed to the whole tone of thought cherished by the majority of his sect. He was, however, appointed to the work of a preacher in his *seventeenth* year, and entered upon a course of education under the direction of Dr. Fawcett, the preacher at Hebden-bridge chapel, and a man of much influence among the Baptists. As yet, Foster did not leave his spinning-wheel, but combined with mechanical labours the severest application to study; frequently spending great part of many a night in reading, and especially in those prolonged meditations which furnished him with a key to the secret and deep places of the mind, providing him with that microscopic species of perception which detects whole realms of life where others see but a tame dead level.

After some time had been thus employed, another transition-point occurs in Foster's life, which was his removal from the spinning-wheels of Yorkshire, and the narrow circle of Hebden-bridge, to the Baptist Seminary or "College" at Bristol, where the preachers of the sect are prepared by a course of theological studies for their future pursuits. It cannot, however, be said of Foster that he laid the tolerably furnished library under any extraordinary contribution; many a student of the humblest powers has more frequently visited the book-cases in the long room, and more diligently used the full shelves in the lecture-room, where Gill, Poole, Doddridge, Henry, and other biblical commentators, invite to a study of their portly folios. Foster was indolent in the pursuit of strictly *Academical* studies, and does not seem to have paid much court to Plato or Cicero, the Greek dramatists or the Latin poets, though he professed in later years an ardent admiration for Lucan. We must not, however, infer that our student was really idle; the youth who had passed whole nights of study in his father's humble house, was not likely to sink into slothfulness amid the greater advantages of Bristol. Foster gave himself up to that miscellaneous, dreamy, and meditative line of

study more suited to his tastes than a systematic training. Such men are ever working, and find materials for their intellect in crowded streets or silent moor-sides; and thus our Bristol student was occupied, though little troubled with the prosy speculations of Whitty or Gill. Indeed, he seems to have been, at this time, a contemner of the whole host of biblical critics, of whom he thus writes to a friend:—"As to expositors, we have here Gill, Henry, and twenty more, but I very rarely open any of them." His mind was not fitted to delight in the common-place remarks with which so many commentators have filled their bulky tomes, rather choosing to look at a simple statement, and then exercise upon it that reverential scrutiny which generally detects some latent principle or hidden beauty in the most common fact. Some persons will pass through a forest rich in the mellowed tints of autumn, and never pause to mark the grandeur of the scene; but others will find a world of interest in a single leaf, and observe in its delicate structure facts, pointing to the great laws of nature, and the attributes of the Divinity. In the latter class was Foster, and to him a text of scripture suggested more sublime thoughts than could ever be collected from the prolixity of Gill, or even from the simple piety of Henry. It may be fearlessly asserted that the long gloomy-looking building in Stoke's Croft, Bristol, which the stranger looks at, deeming it some prison, has never since had within its walls so powerful an intellect; not one of those small studies, ranged along each side of the first corridor, has witnessed the meditations of a second Foster.

The future essayist had now become a noted character amongst his fellow students; for the exercises delivered in the lecture-room¹ could not fail to develop the genius of the Yorkshire spinner, and the classical tutor, Mr. Hughes, was able to appreciate the abilities of the young student, though far his inferior in mental power. But Foster was now a preacher; what did the simple villagers around Bristol think of the lecturer? Little honour, we suppose, awaited him from the rustic congregations, or the rude mariners of the villages along the Avon or the Severn. His friends indeed now began to apprehend, that, as a preacher, Foster would never do much; oratorical powers he had not in the smallest degree; and he himself declared, "My tongue rubs against my teeth, like Balaam's ass against the wall, and will not, cannot perform the movement which its master requires." The causes of his non-acceptance as an orator were not, however, merely physical; the greater part must be ascribed to the peculiar cast of his mind, which led him to luxuriate in subjects most distant from the thoughts of common and illiterate men. We have frequently heard the quaint but emphatic remarks made by the uneducated upon Foster as a preacher, and the result seemed to be this,—that, whilst untutored common-sense would not fail to be interested by the originality of his remarks, and the force of his illustrations, it was wholly unable to sympathise with the *mould* into which Foster cast his thoughts. Indeed, we have heard persons ranked amongst the educated classes declare that they could not understand the peculiar style of this author, and were not ashamed to avow their inability to "comprehend him."

He left Bristol at the age of twenty-two, and became the teacher of a congregation in Newcastle-upon-Tyne, where the unfitness of his mind for pulpit-work began to show itself in a variety of painful forms. His audience was small, and, what was more grievous to him, of most ordinary elements, to whom a rough common mind would have been far more pleasing than the fastidious Foster. Often, when he walked in his solitude to the

¹ A sermon and an essay were read by each student in his turn from a small desk placed in a corner of the lecture-room; all the tutors being present with the pupils, each of whom it allowed to criticise the production read. How did Foster relish such an ordeal, before such critics?

dull meeting-house on Sunday evenings, listening to the chiming bells from the parish churches, must he have desired a wider, or at least a more intellectual, circle of hearers: he must have seemed like some isolated dweller in a country the language of which he knew not: and the illustration holds good in Foster's case especially, for, with all his deep insight into the mind, he was unable to find his way into understandings widely differing from his own. Foster, therefore, wanted that highest peculiarity of genius, the power of speaking to the hearts and intellects of *all* men. Finding himself thus isolated in populous Newcastle, he sought to find in the visible forms of nature that matter for his musing mind which his fellow-men were not able to afford, and often betook himself in quiet evenings, or the stillness of moonlight nights, to the quay between the ancient walls and the deep Tyne, where he pondered on the sights presented by the starlit heavens, or the varying aspects of the earth. But Newcastle was no place for Foster, and in about three months he left the place, returning to his native home in Yorkshire.

We next find him in Dublin, whither he had gone at the invitation of a small congregation, who perhaps expected great things from one of whose abilities they had heard, without inquiring minutely into the peculiarities of those powers they sought to gain. To Dublin he went, but the only result was, that his unfitness for a preacher's work became more manifest, a deficiency proved by the small audience becoming so much reduced, that to remain there was impossible. The place in which he preached in Dublin was situated in *Swift's Alley*, but this local name was the only thing pertaining to intellect connected with the spot, so that Foster was again a wanderer, and returned to England dispirited, and really grieved, that the sanguine expectations of his friends should be disappointed in him. Remedy there was none; as he could not alter the modes of thinking popular among his sect, nor materially modify the cast of his own intellect.

In 1797 we find him at Chichester, officiating as preacher to a congregation for whose benefit he appears to have exerted all his efforts; but, as he could not *preach popularly*, disappointment again ensued. The hearers dwindled away until the mere shadow of a congregation remained to listen to beautiful sentiments and profound thoughts—with which they could not sympathise. Something of this general unacceptability must be attributed to Foster's *eccentricities*, which reached such a reprehensible point, that he even laid aside the dress generally worn by those who profess anything approaching to the character of religious teachers; and, if Foster had doubts respecting his *right* to exercise such an office, an instant resignation of the work would have been more suitable to his character as a Christian, than the adoption of practices which necessarily brought ridicule upon religion. He appeared in the pulpit attired in the common lay garb, having his hair bound up in a tie, and wearing a red waistcoat, which though not so startling then as it would be now, was sufficiently so to excite severe condemnation.

THE LEGEND OF THE HOUSE OF THE DWARF, IN THE ANCIENT MEXICAN CITY OF UXMAL.¹

"THIS is called the Casa del Enano, or House of the Dwarf, and it is consecrated by a wild legend, which, as I sat in the doorway, I received from the lips of an Indian, as follows:

There was an old woman who lived in a hut on the very spot now occupied by the structure on which this building is perched, and opposite the Casa del Gober-

nador (which will be mentioned hereafter), who went mourning that she had no children. In her distress she took an egg, covered it with a cloth, and laid it away carefully in one corner of the hut. Every day she went to look at it, until one morning she found the egg hatched, and a criatura, or creature, or baby born. The old woman was delighted, and called it her son, provided it with a nurse, took good care of it, so that in one year it walked and talked like a man, and then it stopped growing. The old woman was more delighted than ever, and said he would be a great lord, or king. One day she told him to go to the house of the gobernador, and challenge him to a trial of strength. The dwarf tried to beg off, but the old woman insisted, and he went. The guard admitted him, and he flung his challenge at the gobernador. The latter smiled, and told him to lift a stone of three arrobas, or seventy-five pounds, at which the little fellow cried, and returned to his mother, who sent him back to say, that if the gobernador lifted it first, he would afterward. The gobernador lifted it, and the dwarf immediately did the same. The gobernador then tried him with other feats of strength, and the dwarf regularly did whatever was done by the gobernador. At length, indignant at being matched by a dwarf, the gobernador told him that, unless he made a house, in one night, higher than any in the place, he would kill him. The poor dwarf again returned crying to his mother, who bade him not to be disheartened, and the next morning he awoke, and found himself in this lofty building. The gobernador, seeing it from the door of his palace, was astonished, and sent for the dwarf, and told him to collect two bundles of cogviol, a wood of a very hard species, with one of which he, the gobernador, would beat the dwarf over the head, and afterward the dwarf should beat him with the other. The dwarf again returned crying to his mother; but the latter told him not to be afraid, and put on the crown of his head a tortillata de trigo, a small thin cake of wheat flour. The trial was made in the presence of all the great men in the city. The gobernador broke the whole of his bundle over the dwarf's head, without hurting the little fellow in the least. He then tried to avoid the trial on his own head, but he had given his word in the presence of his officers, and was obliged to submit. The second blow of the dwarf broke his skull in pieces, and all the spectators hailed the victor as their new gobernador. The old woman then died; but at the Indian village of Mani, seventeen leagues distant, there is a deep well, from which opens a cave that leads underground an immense distance to Merida. In this cave, on the bank of a stream, under the shade of a large tree, sits an old woman with a serpent by her side, who sells water in small quantities, not for money, but only for a criatura, or baby; to give the serpent to eat; and this old woman is the mother of the dwarf.

THE BATTLE OF OTTERBOURNE.

(FOUGHT A.D. 1388.)

"O Douglas, Douglas, tender and true!"—*Old Ballad.*

It is the Percy's pennon that strangely waves on high,
 In wan moonlight, amid the fight of Scotland's chivalry;
 But Percy comes, he comes amain, and loud the battle raves
 Where o'er the gallant Douglas that haughty standard waves;
 And all Northumbria's noblest are mustering on the plain,
 With Neville's and with Dacre's, that standard to regain;
 And all the flower of Scotland is mingling in the war,
 St. Clare and many a Drummond, with Moray and Dunbar,¹
 And he whose hand the mightiest brand in all the battle drew,
 In blooming youth, with graceful mien, the Douglas brave and true.

Then evermore like waves that roar in vain on rock-bound strand,
 That southern army charges home the chiefs of northern land;
 But stern and high the battle cry, that bids the Borderer close,
 Of "Douglas, Douglas, for the right!" from all that line arose,
 As proud and calm the peerless knight to his last charge drew nigh,
 With boding soul, but flashing eye that spake of victory!
 Oh! glory to the "Bloody Heart" that gleams upon his shield!
 And glory to the stalwart arm that bids the foeman yield!

And now the moon is waning; nor friend nor foe descries
 The blood-stained spot where, faint and low, the wounded Douglas lies;
 A soldier-priest² that ever nigh his dauntless chieftain stood,
 Bends over him he loved so well, in sorrow's darkest mood;
 Sore-smitten was the knight, but yet, with eye whose burning light
 No mortal foe might ever quench, he watched the doubtful fight.

"On, on," he cried, "my merry men! and thou whose faithful shield
 Alone supports the Douglas on this his last red field!
 Go, shout on high the stirring cry that bids our comrades close,
 That so the fame of my good name may still confound the foes;
 For these strong limbs shall never waste on couch of lingering pain,
 But like my sire I meet my death on battle's blood-red plain;
 And yet I know, the conqueror's shout shall sound ere early morn,
 Meet requiem to the Douglas that falls by Otterbourne;
 For once in watches of the night, I dreamed a dreary dream³
 Of spectral man, that pale and wan, 'mid living hosts did seem
 With good broad-sword to win that day the crown of victory,
 And now I know 'tis true at last that spectral knight was I!"

Once more the ranks of England are charged with might and main,
 And once they seemed to rally, then madly scour the plain;
 For the great brand of the dying Earl seemed mighty as before;
 No living knight such wonders wrought as he who fought no more.
 A simple cross amid the heath, with pious hands they rear,
 Then bear away, in sad array, the Douglas on his bier.
 And now he sleeps amid the sirois of his own lofty line,
 And banners wave above his grave, in good St. David's shrine.
 And Scotland's maidens many a day in simple song shall mourn
 The dying knight that won the fight so well at Otterbourne.

THE MAIDEN AUNT.⁴—No. III. CHAP. VI.

I found Owen, as I expected, in great wrath. He was walking rapidly up and down the room, while Kinnaird, whose levity was unconquerable, stood on the hearth-rug, coolly regarding him, and looking ready to laugh—an inclination which good breeding scarcely restrained. My brother stopped in his angry walk as I entered, and, coming close up to me, said, with great vehemence, "Peggy, this is the most incredible piece of absurdity that I ever met with in my life. Of course, it cannot be permitted to go on for a moment, and I only wonder that you—but you have evidently been duped in the matter."

I saw Frank's colour rise at the offensive word, and hastened to interpose. "I have been mistaken, certainly,"

I said, "and I am very sorry that I have misled you unintentionally." Here I stopped, for I was afraid to attack his opinions, and unwilling to acquiesce in them, so I resolved to stand on the defensive.

"Misled me!" replied my indignant brother. "Yes—but I have my own folly to thank for it, in not putting Miss Kinnaird under the charge of a person who knew something of the world—Mrs. Albanley for instance"—(oh, could Mrs. Albanley have heard him!)—"Yet, even allowing you the simplicity of a pinafores girl of thirteen, I can't understand how you should have so completely lost your wits. The insanity of allowing this Captain Everard's perpetual visits is to me perfectly inexplicable."

(1) See *Protestant*—(Johnson's Edit. Vol. II. 362) who adds, "Of all the battles that have been described in this history, great and small, this of which I am now speaking was the best fought and the most severe; for there was not a man, knight or squire, that did not quit himself gallantly, hand to hand with his enemy."

(2) The "Bloody Heart" was the well-known cognizance of the House of Douglas, assumed from the time of the good Lord

James, to whose care Robert Bruce committed his heart to be carried to the Holy Land.—*Scott's Notes to the Lay of the Last Minstrel.*

(3) William of North Berwick, who was Chaplain to the Douglas.

(4) See the Ballad of the "Battle of Otterbourne" in *Scott's Border Minstrelsy.*

(5) Continued from page 362.

"This Captain Everard," remarked Kinnaird, "is one of the most distinguished officers in the service—a man as superior to Lord Vaughan, in mind and manners, as Lord Vaughan is to a chimney-sweep—and, moreover, my most intimate friend."

"So be it," returned Owen, more calmly, but with intense obstinacy of tone, "nevertheless, his pretensions to the hand of Miss Kinnaird are simply ludicrous, and I do not intend that he shall have the opportunity of urging them again. Perhaps you will have the goodness to notify this to him."

"No, Mr. Forde," retorted Frank, "I must request you to be the bearer of your own messages—I cannot undertake the office."

"My dear Frank," said I, putting my hand on his arm, "it is not by irritating my brother that we have any hope of changing his resolution. You are naturally excited; now, do go away, and leave me to do the best I can with him. Go to Edith," added I in a whisper, urging him gently towards the door, "I think she ought to hear the truth at once."

He seemed, at first, disposed to resist my suggestion—but at that moment a step was heard in the hall, and with a half-laugh and a significant look to me, he quitted the room, leaving me with the consolatory impression that he had gone out to join his friend, and, not improbably, to conduct him to Edith!

By this time Owen had quite recovered his coolness, which, indeed, rarely forsook him, and turning to me he said, with a deliberation which left no room for hope, "There is no use in discussing the subject. The young lady will, I dare say, shed a few natural tears, and pout a little, as in duty bound—but in a fortnight she will be ready for another lover, and by the year's end she will congratulate herself on having some one to act for her, who has the good luck to possess a little common sense. Only let this be distinctly understood, that I allow no interview, no engagement, no correspondence. I won't have an under-current of mystery to keep up sentimental nonsense in a silly girl's brain. Let it all be at an end, and, if she behaves well, I promise to say nothing to her about it. Tell her this, Peggy, and now let me get my luncheon."

"Owen, you are positively cruel. I do assure you this is no new girlish fancy that will pass away. It is unfortunate, I admit, but she is really and thoroughly attached to him."

My brother began to laugh. "I admire the real and thorough attachment of a girl of eighteen," said he. "A pack of nonsense! I beg your pardon, Peggy, but I certainly never made a greater mistake than in selecting you for a duenna—your manner of viewing things is so imitatively youthful. Take her to choose a new bonnet, or talk to her about her court-dress for the spring!"

The tone in which he spoke was inexpressibly provoking, and I felt my temper beginning to give way. "As you say," I replied, "it is useless to discuss the subject—our views are so utterly opposite, that each speaks to the other as if in a foreign language. I consider you at least as much in the wrong as you consider me. Only, if you fancy it will be an easy task to induce Edith to give up her engagement, I can tell you you are completely mistaken."

"You are angry," he answered, "yet you can scarcely be surprised that I don't feel any very profound confidence in your judgment just at present. I know your intentions are the best in the world—but I can't forget that it is scarcely a week since you wrote me word that Miss Kinnaird was in a fair way to become Lady Vaughan. My dear Peggy, if you will walk through the world with your eyes shut, and resist every effort to open them, you must at least suffer yourself to be led by the hand."

I bit my lips and was silent, and Owen withdrew to his bedroom. I went slowly up stairs to Edith's boudoir, where, as I had anticipated, I found both Kinnaird and

Everard. Edith herself was sitting on the sofa, her face bowed upon her hands, and her tears falling fast through the clasped fingers. Captain Everard addressed me at once:

"Miss Forde, before I go—and I feel that I must not remain—I am anxious that you should do me justice. Till this morning I was not aware of Mr. Forde's existence, much less of Edith's"—(he pronounced the word with a lingering hesitation of tone very unusual with him, and a most eloquent glance at the drooping figure on the sofa)—"much less of Edith's dependence on his will. I imagined that Frank and yourself were her sole guardians, and you know that, even when I thus thought, I was not guilty of the presumption of supposing myself an acceptable suitor."

"No, no—not presumption—don't use the word!" murmured Edith.

He looked at her for a moment in silence, and then proceeded, though in a less steady tone of voice, "I am as conscious as Mr. Forde himself can be, that a poor man, and a man of no family, is, as the world judges, without a right—"

But here Edith interrupted him. Suddenly clasping his hand between her own, and lifting her beautiful face, all burning with blushes and suffused with tears, she exclaimed, "Oh, hollow nonsense! It is *yourself* that I love. One unset diamond is more valuable than a tiara of glittering paste! What could family or fortune have to do with you, except to solve honour from you?"

Recovering himself with an effort, and still keeping Edith's hand in his, Everard continue in a low restrained voice, the calmness of which betrayed the intensity of the agitation which he was repressing, "I should despise myself for ever were I capable of taking advantage of those feelings to involve her in a clandestine engagement; at her age—under her circumstances—it were unmanly and dishonourable. No! I must go—for three years we part, and she is as free as if she had never known me."

"She is free!" repeated Edith. "Ah! say it of me if you will; but you do not dare say it to me. You cannot mock me by telling me that I am free, at the very moment when you are riveting my chains. But oh! such a happy prisoner!" she added, relapsing into tears, and speaking in a broken, faltering voice; "we have not time for all this conventionalism—this acting—oh! speak *really* to me!—this once more—this last time—speak as you are, and as you feel!"

His stoicism was fairly conquered. "My own Edith!" said he, in a voice tender as a mother's to her first-born—reverent as a devotee's to his saint—"I will not wound you any more by false phrases. It is true; you are my own; and were we to part for ten years, instead of three, I should esteem it sin to suffer one doubt of you to trouble my peace. My faith in you comes next to my faith in God; (God grant it be not the stronger of the two!) Bear these three years, for my sake; knowing that I am with you the whole time, though the wide world be between us, and that, when we meet, we shall meet as though we had never parted!"

She subdued her emotion to listen to him; raising her head, and holding her breath, as though she feared to lose a word. What evil spirit brought to my mind at such a moment her vain and girlish love of general admiration and attention, and suggested to me that she would fall in the refined and impassioned constancy which he demanded of her?

"And, remember this, my beloved," he continued more hurriedly, "that I go from you, a changed man, and that the change is your work. My misanthropy is gone from me. I feel that I have sinned against the world, and the race to which I belong. I feel and confess the folly and self-sufficiency of my distrust of others. Even at this moment, this thought makes me happy; for my faith and love are restored."

anew. Frank," wringing his hand, "I have wronged you; forgive me; I know you now,—aye, and I know myself too. Edith—but it is enough! God bless you!"

Silently returning my silent pressure of the hand, he hurried from the room, and the low sobs of Edith were the only sounds which disturbed the stillness.

And so ends the history of the first period of my acquaintance with Edith Kinnaird. A nervous fever was the natural result of that day of agitation; but it was neither long nor severe; and Owen classed it with the hysterics and fainting-fits which he believed that all young ladies were capable of summoning to their assistance at pleasure. When I resigned her to the charge of Lady Frances Moore, she had recovered her health, and, in some measure, her spirits; for she was of an elastic and energetic nature, and was now possessed by the one sole purpose of cherishing secretly the recollection of her lover, and endeavouring to employ the three years of separation in rendering herself more worthy of him. I knew how soon this enthusiasm would flag; how wearily the slow hours would struggle onward; but in very pity I would not disturb it. Like the eagerness of a young horse at the foot of a long steep ascent, though transient, it was real, and would carry her forward unconsciously over a portion of the way. But the toil must begin; and, alas! how would she bear it!

With her tacit engagement Owen could not interfere—about the state of her feelings he did not trouble himself; and the next thing I heard was that she had been presented at Court in white satin and diamonds, and all London was raving of her matchless beauty.

ROAD-SIDE SKETCHES OF GERMANY AND THE GERMANS.¹

WHATEVER the future fortune of Germany may be, it is to be hoped that its children will never lose their present moral character. They are the most engaging people possible, meaning not sprightly and amusing, but people with whom you rapidly and easily feel yourself at home. The first point in their character which strikes one, is the honest simplicity which distinguishes almost every one you meet; there is none of the vain-glorious vapouring of the French, or the loquacious impudence of the Yankee, or the morose self-sufficiency of the English, but a good-humoured and affectionate single-mindedness and probity of thought and action, which at once sets one at ease even in a company of perfect strangers. From the fat old fellows, with scarce any necks and enormous paunches, whose whole life seems devoted to smoking long pipes and drinking coffee, to the chubby cheeked, yellow haired, round-sterned little dandels whose existence is divided between reading romances and knitting stockings, this charming simplicity is universally apparent. And, united to this, is a good humour and kindness of disposition which renders it still more agreeable: one seldom sees a German in a passion; this may be attributed to their phlegmatic temperament; but then, one still more seldom sees one of a sulky sullen demeanour; on the contrary, they seem always to have a smile and a kind word for every one and everything. All those little inconveniences, which would set an Englishman fretting and fuming for a day, are disposed of with a laugh, or at most a long winded but most harmless execration, and an extra whiff; nor, as they grumble less, do they enjoy less; on the contrary, they not only delight in all the beauties, whether rural or urban, of their land, but always take pleasure in pointing out to strangers whatever may be of interest to them. In fact, I do not know how the Germans ever acquired that character for boorish rudeness and bluntness of bearing which, in former

times at least, was commonly attributed to them. To me it seems that the honest kindliness of their dispositions has led them to exactly the right medium between our own surly reserve, and the chattering showy politeness of the French. The politeness of the French, from the peer to the meanest peasant, as contrasted with the demeanour, especially of our lower orders, has been commented on with admiration from the days of Addison and Goldsmith to our own, till it has become proverbial; and I do not deny them all the merit which they are entitled to claim on this score; but yet the politeness of the French always seems to me to have too much gloss and tinsel about it; the substratum of genuine kind feeling, which is the foundation of all true politeness, I cannot help thinking is generally wanting, or at any rate the outward froth and foam is so superabundant as entirely to conceal the reality beneath. But with the Germans it is quite the contrary: all their politeness seems to spring from, as it is accompanied by, good feeling and kindness of heart, so that, though there may be more homeliness and less finish about them than with their French neighbours, there is a heartiness and benevolence mingled with their courtesy, which makes it far more pleasing. Nor are these agreeable manners confined to the upper and middle classes. I remember, one morning rather early, in a somewhat out of the way place not far from the Rhine, being in want of breakfast, going into a small Gasthaus, or, as we should call it, road-side public house; the only provisions which could be produced without delay were brown bread and beer; and I sat down to discuss this breakfast at a table at which a labouring man was making his way through a repast composed of similar materials. He was but a working mason, and evidently very poor; but he made room for us, and proffered various little courtesies with as much politeness as if he had been a nobleman. Finding we were English, he entered into conversation about the country, and so forth, and, telling us that several of his relations had emigrated to America, asked our advice as to the expediency of his doing so himself, as to the best way of doing it, and various other matters; always apologizing for the liberty he was taking, and uniting in his conversation a degree of simplicity and politeness which contrasted strangely with what would have been the bearing of a peasant in Suffolk or Yorkshire in similar circumstances. When he had finished his breakfast, he rose with an apology and a regret that he was obliged to go, and, with a low bow, wished us good morning and a pleasant journey. Now, there was something very striking about all this to an Englishman, who is accustomed to connect boorishness of address with lowness of station, especially as there was nothing cringing or servile in the man's demeanour, but, on the contrary, a proper respect for himself, mingled with a sense of what was due to others. Then, the upper ranks reciprocate the same politeness of behaviour, and no one can travel in Germany without seeing everywhere numerous instances of perfect affability amongst those highest towards those lowest in station. One meets with very few of the Limkins class, very few of those superb personages who, feeling that

"Nature had but little clay
Like that of which she moulded them,"

are always afraid of the least communication with those of common mould, for fear that the pure china of which they are composed, should suffer from contact with mere earthenware. On the contrary, princes and nobles seem to put their patents of nobility into their pockets, and only to take them out with their passports. Our friend the Bavarian general was a capital instance of this sort of thing. Baron though he was, and knight of I don't know how many orders of merit, from the Black Eagle of Prussia to the Lion and Sun of Persia, he sat at a common table in an inferior inn, with shopkeepers, mailguards, and travelling pedlars, and conversed with them as comfortably as if they had all been titled guests,

with their legs under his own mahogany, whilst they, though evidently a little proud of their table companion, joked and laughed with him, conversing as freely and unceremoniously as if he had been one of themselves; all the time, however, giving him his title, and treating him with proper politeness. The Baron had but two acquaintances in Wurzburg, one a young nobleman who was a student at the college there, and was not to be found, and the other a poor apothecary, who kept a small shop hard by. On coming in, in the evening, from a walk, we found the Baron and the poor medico sitting together over a bottle of wine, and chatting as comfortably as if there had been no difference in their ranks. These panegyrics, however, on the ease and familiarity with which all ranks mingle together in Germany, must be taken with a reservation; for, when we hear the English abused for the exclusiveness with which they avoid communication with those of inferior rank, the answer to the accusation is, that this very exclusiveness is in reality the best proof that no essential exclusiveness founded on difference of rank exists. I have read somewhere a remark on the greater formality of the forms of society in the highest circles in England, now-a-days, than in former times, inasmuch as that, whereas a hundred years ago it was common to address and speak of noblemen of the highest rank by familiar and christian names, every one now is mistered and my lorded even amongst friends; and the explanation given of this anomaly was a very satisfactory one,—that in former times the persons who met in the common circle of acquaintanceship were all of the same, or nearly the same, rank, so as to be able to speak with perfect freedom without fear of offending; but now that these exclusive barriers are broken down, as persons of various stations mix together, the same familiarity cannot exist outwardly, though the essential familiarity of intercourse is much greater. So in the present day amongst the most exclusive society in the world, the *crème de la crème* of Vienna, princes and princesses often call each other by their Christian names, while, on the other hand, in America, where all real difference of rank is unknown, there exists the greatest exclusiveness of circle, and the utmost formality of politeness. And this in a great measure accounts for the difference in this respect between our own habits and those of Germany. Whoever classes are separated by a real and distinct line of demarcation, there may be much intercourse, and that intercourse may be much more familiar between individuals of those classes, than where there is no such division, and where, consequently, in order to keep up the distinction at all, the upper classes must necessarily be exclusive. In the middle ages, the lord sat at the same table with his dependants; he mingled in their sports, and held much more frequent intercourse with them than now, because the line between their ranks was so distinctly drawn, that it could never be encroached upon; but now, no one sits down to table with his footman, or has the housemaid to do plain work in the drawing-room, because John is no longer the born vassal of, but as good a man as, his master, and Sally may wear silks and satins, and ride in a coach, if she chooses to pay for it, without fear of the sumptuary laws or any others. Now it is this state of matters, this real want of exclusiveness, which produces that outward exclusiveness, of which so much is said. But in Germany, on the other hand, things are in a different position; till very lately the privileges and the rights of the various classes in the nation were very different, and ranks were rigidly divided by a very distinct line; the influence of this constitution of society has not yet passed away. Even now, the nobles form a very distinct class; the pride of pedigree still exists almost as strongly as ever; we often see a man without ten pounds in his pocket, with his coat of arms of sixteen or twenty quarters emblazoned on his pipe, or his pocket-book. There are several orders of knighthood, to be eligible for which the candidate must produce a genealogical tree,

displaying a certain number of unblemished descents; and marriages between the nobility and the burgher class are looked on with great suspicion and spoken of as *mésalliances*. Then the system of orders of merit of itself creates a palpable distinction of classes; so that, on the whole, the division of ranks is far more strongly and more directly recognised in Germany than in England, and thus a greater familiarity of casual intercourse is admissible in the former country, than with us.

With regard again to another point which is generally urged against the English by foreigners, namely, their coldness towards strangers,—their intense dislike to hold communication with any one to whom they have not been introduced, as contrasted with the foreign custom, that, if three or four persons are casually thrown together, they shall begin chatting as if they had known one another all their lives;—the foreign system is undoubtedly the pleasantest and the best. Every one knows the story of the young gentleman at Oxford, who declined to assist a fellow-collegian out of the river when drowning, because they had never been introduced; and every one too has experienced the martyrdom of an evening party where you know no one; every one knows the misery of such a situation, the intense labour of the attempt to appear comfortable, whilst all the time you feel continually in the way, and think everybody must be looking at you; the ardent longings to get home, and the Byronic misanthropy which grows on you, and the frightful conviction of the demoniac joy which you would feel if every one of the human beings present, but who to you are mere tabooed dolls, were to be annihilated on the spot. Nothing, certainly, can be more absurd than our fashions, with regard to the necessity of an introduction, before two rational and sentient beings can recognise the existence of one another,—but we must not let our indignation hurry us too far. It may be laid down as a pretty general rule, that the most savage and warlike nations are the most polite: an American Indian is as full of punctilios as a Spanish hidalgo; and the highlanders, who were the last of the inhabitants of Britain in the general custom of carrying offensive weapons, were, and still are, distinguished for politeness; and the reason of this is apparent; the principle is the same as that which renders every member of a company precisely observant of the minutest rules of good breeding, the instant that a professed duellist is introduced amongst them; but, on the other hand, the very state of society, which renders universal politeness necessary, prevents people from suddenly forming acquaintances, for an acquaintance with any individual is not then a mere casual interchange of intercourse, but a binding friendship, an engagement to stand by one another in all circumstances. Thus, in the feudal times, men either knew each other not at all, or were sworn allies. The effect of this state of society is still traceable in the difference between the manners of Scotland and England, wherein the former country, being latest civilized, the inhabitants are notoriously colder, and more reserved towards strangers, than in the latter, whilst, at the same time, the bond of connexion is far stronger amongst relatives and intimate friends. On this principle, however, it may be said, that the difference between English and German manners should be exactly the reverse of what it is in fact; that in Germany, the latest and less civilized country, there should be less aptitude for acquaintanceship than in England. I have heard this contradiction explained by the Germans, by saying that the old principle which formerly obtained in consequence of their warlike turn, has been continued from the commercial habits of the people of England: that, as in former times, one required to know something of a man's *following*, before making friends with him, so as to calculate what his aid might be in a feud, so now it is necessary to have the recommendation of a friend in order to be assured that he is a good man. There may be some truth in this view, but the

gist of the matter, as I have read or heard somewhere, lies in this point, which is generally misunderstood by those who complain of the English reserve, that the effect of a foreign acquaintance picked up at random, and of an English one following an introduction, is not the same. If Count A. meets Count B. on the deck of a steamer, and exchanges cigars with him, and they talk together for half a day, then if Count B. is detained as a suspicious person on account of an error in his passport, Count A. does not concern himself in the matter; his friend may be a pickpocket, or one of the Carbonari, for all he knows or cares, and, had he known him to be such, he would, very probably, have formed the acquaintance with him all the same; but, when Mr. Jenkins is introduced to Mr. Tomkins by their mutual friend Mr. Simpkins, then, if Jenkins gets into a scrape, things take a very different course,—he appeals to Tomkins; and he, though he may know no more of Jenkins than of the man in the moon, yet knows that he has been introduced to him by Simpkins, and, acting on Simpkins's introduction, he does what he can, in an ordinary way, for the distressed one. Thus an English acquaintanceship is very different from a foreign one, for the introduction, the letter of credit, produces in effect a sort of friendship, a something tangible, whereas the sum total of the casual acquaintance is, in reality, a mere cipher. Thus the principle which I stated above is not in truth contradicted, for the real acquaintance, the confidence in each other, is not sooner acquired abroad than at home, or rather, it is not nearly so soon acquired, from the very frequency of these casual acquaintanceships; and, to produce anything like real acquaintance, an introduction is just as necessary there as here. No doubt, with foreigners, the act of talking is performed, when with us absolute silence is imposed as a rule; and no doubt, in this point, their system is better than ours; but this difference, I suspect, must be attributed to the smallness of our organs of loquacity: for the rest, all that I wished to show was, that it is wrong to contrast the conduct of Englishmen and of foreigners, with regard to introductions and acquaintance, as completely parallel, because, in truth, the circumstances and effects are not the same.

All this grand discussion, however, has led me far enough away from the little inn at Wurzburg, at which we put up on arriving in the Heidelberg diligence. I have said, that the old towns of Germany are well worthy of study, on account of the *statu quo* state in which they remain. But Wurzburg, though it must be included in this class, is amongst the least interesting of the old towns, and this for the very reason, that it never was particularly distinguished as a town. Its power and influence arose from its being the seat of a bishopric, one of the richest in Germany, and the holder of which was a prince of the empire. His clerical monarchy came to an end in the late war, at the close of which this city with its territory was made over to the kingdom of Bavaria, and the grand palace which the bishops built for themselves now belongs to his Bavarian Majesty. It is considered the great show of the place, and the inhabitants are very proud of its mirrors, and hangings, and bad pictures; but unfortunately this is a species of exhibition from which I never can manufacture any enjoyment. The palace is a huge pile, and the countless suites of rooms are fitted up in imitation of Versailles, and I dare say with almost as good effect. But though a Frenchman might consider my opinion rank blasphemy, I must confess that even that gigantic repository of plate-glass and ormolu appeared to me as anything but imposing. It strikes me that there should be a difference between the fittings up of a kingly residence and a theatre, and that a palace should not be merely an extended edition of Swan and Edgar's. However, the fault may be in my own want of taste, and not that of the upholsterers of the last century, and those who are blessed with a finer feeling of art will doubtless find much to admire in the palace of

Wurzburg. At any rate, they will be delighted with the palace gardens, which are truly beautiful, and in which all the "beauty and fashion" of the city disport themselves of an afternoon. We walked there for some time, with great pleasure, and should have remained longer, but that our Bavarian general hurried away in a fury at being obliged, by one of the sentries, to put out his pipe, because, as the baron observed with a sneer, it would destroy the respect due to royalty, if people were allowed to blow a profane cloud in the vicinity of a house which might, by possibility, contain a king.

Wurzburg, being a clerical city, is of course remarkable for the number of its churches; but, though the bishops were amongst the richest of the German prelates, having, if I remember right, a revenue of full half a million of florins, they have not contrived to make any of them very handsome, except, indeed, the cathedral, which, however, is more remarkable for the gorgeousness of the decorations of the interior, than the architectural beauty of the building. The most striking of these decorations are the statues and tombs of I don't know how many of the deceased prince-bishops, each holding the cross in one hand, and the temporal sword in the other, the latter being quite in keeping with the character of the German bishops of old, who were obliged to fight far oftener than to preach. Indeed, there is a story of a bishop, who, on his inauguration, desiring to see the episcopal library, was conducted to a large room full of weapons of all kinds, and was informed that these were the books which his predecessors had invariably used, and which it was hoped he himself understood to handle with advantage.

As it was a saint's day (I forget whose) there was a sort of fair or market, in a very humble way, in the principal square; and the churches were thronged to the doors, chiefly by country people; for these peasants appear to be much more strict in their religious observances than their fellows of the towns, who, I suppose, consider themselves far too enlightened to trouble their heads or their consciences with such matters. Nothing shows more strongly how small is the real intercourse between the different classes of the population in Germany, than the difference in dress and appearance of the people of the towns and those engaged in rural pursuits, in the immediate vicinity. You know a country man or woman the moment you see them in the street. The advantage, however, is entirely on the side of the townspeople, the others being a stunted, hard-featured race, evidently over-worked and under-fed. The dress of the men is funny enough, and reminds one of old illustrations of the Vicar of Wakefield, consisting, as it does, of a huge three-cornered hat, breeches, and enormous boots. That of the women is still more grotesque, and very much resembles some of the Swiss costumes. The petticoats are improperly short, and the whole of the front of the *body* of the gown is covered with ornaments consisting, in the general case, of bugles, tawdry lace, and gold beads; but frequently, also, there is intermingled with these a number of more costly ornaments, and even gold and silver coins; in short, the great object seems to be to cover the stomach in a costly manner if possible, but at any rate to cover it. Besides these braveries, moreover, the ears are generally loaded with huge gold or silver ear-rings, and the neck is absolutely covered with necklaces. All this splendour of the upper part of the person contrasts oddly enough with the coarse petticoat, still coarser worsted stockings, and huge clouted shoes which cover the less behonoured portion; and the *tout ensemble* reminds one strongly of Horace's mermaid,

"ut tarpiter atrum
Desinat in picea mulier formosæ superne."

Grotesque, however, as the costume is, it is certainly extremely picturesque, and in fancy paintings and at fancy balls I have seen dresses much in the same style

look extremely well ; but then, in real life, one requires something more than mere beauty of dress to excite one's admiration ; the shortness of the petticoat may be an advantage, but it is one which, in my opinion, depends very much upon the goodness of the legs which it displays ; and jewels and lace are very pretty, but their lustre is sadly tarnished if they adorn an extremely plain face, as they generally do in the case of the German peasants ; for it pains me to make the avowal, but it is the truth, that more unfortunate specimens of the diviner portion of the human race it was never my misfortune to fall in with, and the sight of them has given me a stronger distaste than I had before for the German pastoral poetry, if, indeed, there be anything which can increase the distaste of every reasonable being for all pastoral poetry. *Dellias* and *Chloes* are had enough in verse, but Heaven preserve me from the originals, and, above all, from the German originals !

The situation of Wurzburg is beautiful, lying in a plain, by the bank of the broad and calmly flowing *Maine*, and surrounded by sloping heights, covered with the vineyards which produce the justly famed *Franconian* wine. The town, to complete the picture, ought to be as handsome as its position is lovely ; but Wurzburg, as it owed its rise, not to the industry and enterprise of its inhabitants, but the residence of its bishops, displays none of those relics of antique magnificence which are found in other towns of the same date. Much of the old-fashioned air still hangs about its narrow streets, its huge houses, the sides of which turn to the road, and the gloomy and massive looking churches, some amongst the oldest in Germany ; but there is little to remind one of bygone days, and still less to attract the lover of the picturesque. The finest edifice about the town is the ancient bridge, of heavy stone, bordered by old worm-eaten and discoloured statues, which spans the river, and is a fine specimen of the architecture of the period. Above it, on the other side of the stream from the town, rises the steep hill on the summit of which the citadel is perched—a very ancient fortification, but now modernized, and I believe still capable of a stout defence. There is some little difficulty about obtaining an entrance to it, but I made no attempt to do so, for there is nothing more unmeaning to a person ignorant of the science of fortification than one of our modern citadels ;—huge stone walls and frowning buttresses give one an idea of impenetrability, but to my unpractised eye, though I know that it is only want of knowledge which blinds me, there is nothing less imposing than the square dry ditches, and the huge mounds of grass, looking like the graves of buried giants, which one sees now-a-days in strong forts.

We walked along the river side, however, meeting large groups of peasants returning from their devotions, some to the saint, and others to the beer-shops ; and on arriving at home made our preparations for starting the next morning for Nuremberg. To one who has but an imperfect knowledge of the language, it is a serious embarrassment that the Germans are very slow at picking up the meaning of what is said, unless it be properly and grammatically expressed. It seems strange that a people so clever in the acquisition of foreign tongues, should not have more quickness in this particular, whilst the French again, who are notoriously slow in learning any language but their own, are so apt and ready in understanding the meaning of what a foreigner may wish to say, as to be able to catch it up from the faintest indication of his intentions, so that, unless a person speaks extravagantly bad French, he need never be afraid of not being able to make himself understood. I have often been astonished at the way in which I have been helped out of a sentence by a Frenchman, when I had so bungled it that I felt that had he murdered English as I had French, it would have been impossible for me to have understood him. On the other hand, I have frequently been horribly perplexed

at not being understood by Germans when I was sure that my expression was very near the proper one, and have found afterwards that what I had said looked, in fact, all but the very same turn which a German himself would have given to the sentence. Again, it is a curious peculiarity of the German, that it is much more easy to say what one wishes oneself than to understand what is said to one ; and yet, the idiom and turn of the language bears much more similarity to English than does French ; and the Germans do not speak with at all the same rapidity as the French, and almost invariably with far greater distinctness. The solution of this difficulty, however, I apprehend, is to be found in the great richness of the German language as compared with ours. The great obstacle to the perfect knowledge of that tongue lies not so much in the acquisition of its idioms and grammatical inflection, the latter of which so closely resembles our own, but in the vast number of its words, and the various ways of compounding them ; so that, though one may be able to speak for oneself, using the terms with which one is acquainted, yet, when an answer is returned, composed of synonyms utterly dissimilar, and with which, though meaning the same thing, one is unacquainted, the response is unintelligible. The consequence of this is, that the speaking of German, and understanding it when spoken, offers to an Englishman exactly the same difficulty as is felt with regard to English in this respect by the Germans, who have often told me that they found it extremely easy to learn to read English passably, but incredibly difficult to understand anything like a connected conversation.

We encountered something of this embarrassment in settling matters at Wurzburg, chiefly, I believe, with regard to the manner in which our luggage was to be disposed of, but everything was in the end put to rights, and, having taken an affectionate farewell of our friend the old Bavarian general, we started the next morning for Nuremberg.

FRANK FAIRLEIGH ;

OR, OLD COMPANIONS IN NEW SCENES.

By F. E. S.

CHAP. XVI.

THE SUBSTANCE OF THE SHADOW.

"ALL well so far," replied Ellis, in answer to my look of inquiry ; "the bleeding has ceased, and he is fast recovering consciousness. Where is the room ? We must get him into bed at once."

When we had placed him in the bed, *Oaklands* lay for a short space with his eyelids closed, uttering a low groan at intervals ; at length the rest appeared in some measure to restore him, and, slowly opening his eyes, he gazed languidly around, asking in a low voice, "Where am I ?"

"Let me beg you not to speak, Mr. *Oaklands*," said Ellis ; "your safety depends upon your keeping silence : you are at the cottage of your friend Fairleigh." As he heard these words, Harry perceived me standing near the bed, and smiled faintly in token of recognition ; then, making a sign for me to stoop down to him, he whispered, "My father,—you must break this to him—go, Frank."

"This instant," replied I ; and I turned to leave the room, beckoning to Ellis as I did so to follow me. "Tell me the truth," exclaimed I, as he closed the door behind him, "will he live or die ?"

"It is early in the business to pronounce a decided opinion," was the answer ; "nor can I venture as yet to do so,—everything depends upon the course the ball has taken, and that, as soon as the other surgeon arrives, we must endeavour to ascertain ; all I can say at present is, that I have seen worse cases recover. There is one thing," he added, "which may be a satisfaction to you to know,—if you had not brought me, or some one in

my profession, to the ground, he would have bled to death where he fell; no one but a surgeon could have stopped that bleeding."

"If we had been too late, I should never have forgiven myself, and we very nearly were so," returned I. "I cannot understand how it was."

"I can explain it," said Archer, who now joined us. "You left me up at the village, you remember, Fairleigh, when you started to fetch Mr. Ellis; well, just as I was leaving it to return to the Hall, a boy ran past me at the top of his speed, and began knocking at one of the cottage doors hard by; surprised to see any one about at so early an hour of the morning, I inquired what was the matter. 'Master's just had word brought him that some gentlemen is a going to fight a jewel at five o'clock, and I be come to call the constable, for master to give him a warrant to take 'em hup.' 'And who is your master?' questioned I. 'Justice Bumbleby,' was the answer. This was enough for me; I made the best of my way to the Hall, woke Oaklands, who was sleeping as calmly as a child, poor fellow! and he immediately sent his own groom, the lad who went with us to the field, to inform Wilford and his second of what I had heard, and to propose that the meeting should take place a quarter of an hour earlier than the time originally agreed on, to which they willingly consented."

"This, then," thought I, "is the reason why Coleman's scheme failed, and Cumberland arrived too late;—well, one good thing is, it will clearly prove that neither Archer nor Oaklands connived at the intended interruption."

The deep, the agonizing grief of Sir John Oaklands, on receiving from my lips the account of his son's danger, was most painful to witness, and I was obliged to yield to this desire to return with me to the cottage, although Ellis had strictly forbidden his being allowed to see Harry, lest the excitement should prove injurious to the patient, in the precarious state in which he lay. On my return, I found the surgeon of the neighbourhood, Mr. (or as he was more commonly styled Dr.) Probehurt had arrived, and that they were endeavouring to extract the ball, which, after a long and painful operation, they succeeded in doing. From the marks on the coat and waistcoat it appeared that Wilford had aimed straight for the heart; but his deadly intentions had been providentially frustrated by the accident of Oaklands having a half-crown piece in a small pocket in his waistcoat, against which the ball had struck, and glancing off, passed between two of the ribs, finally lodging amongst the muscles immediately under the shoulder-blade. The great effusion of blood had been occasioned by its having divided one of the smaller arteries, which Ellis had succeeded in securing on the spot. The wound was, therefore, a very severe one; but it was impossible to pronounce upon the exact amount of danger at present, as the course which the ball had taken trencched closely on so many important organs, that time alone could show the extent of the injury sustained. With this opinion, in which (strange to say) both doctors agreed, we were fain to content ourselves, and we passed the rest of the day in alternately watching by the wounded man, and attempting to comfort and support Sir John, whom we had the greatest difficulty in keeping out of Harry's room, till Ellis asked him abruptly, "whether he wanted to murder his son?" after which nothing short of force could have induced him to enter it. One of his first acts, having consulted with Dr. Probehurt, who graciously approved of the measure, was to enter into an arrangement with Ellis to induce him to remain constantly with Harry, till his health should be perfectly re-established, if, indeed, that happy event was ever destined to occur. As Sir John's liberality was unbounded, and Ellis's professional prospects rather hazy, his practice at Harley End being chiefly confined to the very poor, who went on the advice gratis system, and expected to have medicine given them into the bargain, the negotiation was soon concluded to the satisfaction of both parties.

Towards evening Harry became more restless; the pain of his wound increased, and feverish symptoms began to make their appearance. As the night advanced he grew delirious, and before morning, was in a high state of fever. For many days his life was despaired of. Ellis never left his bed-side, save to snatch an occasional hour's sleep on a sofa, when I took his place. Sir Benjamin Brodie was summoned from town, and held a consultation with Dr. Probehurt and Ellis. Sir John's grief was something fearful to witness. Although naturally a strong-minded man, this unlooked-for blow and the subsequent anxiety had completely unnerved him. At times he would cry like a child; at others he would sit for hours without opening his lips, his head resting dejectedly on his hands, the image of despair; he could with difficulty be prevailed upon to take sufficient nourishment for his support, and appeared scarcely to notice any thing that was going on. On these occasions, Fanny was the only person whose influence was of any avail; with her own hands she would prepare some delicacy of which she knew he was fond, and, when with a melancholy shake of the head he rejected it, she would seat herself at his feet, and, taking his hand within her own, whisper kind words of hope and consolation to him, till the old man's heart was softened, and he could refuse her nothing. Sometimes even this failed, and then she would begin singing in a low sweet voice some plaintive simple air that he loved well, till the tears would steal down his grief-worn cheeks, and, laying his hand upon her fair young brow, he would bless her, and say, that the God who was about to take his noble son from him, had sent an angel to be a daughter to him in his stead. And so the weary days wore on, and, still vibrating between life and death, the strong man, his unequalled powers now reduced to the weakness of childhood, lay stretched upon the couch of suffering, whence it appeared too probable he might never be removed, save to the last sad resting-place of frail humanity—the grave.

About the eighth day, the ligature with which Ellis had tied the artery came away, and the wound assumed a rather more favourable appearance, but the fever remained unsubdued, and the delirium continued. Each day which passed without improvement added to the length of Dr. Probehurt's solemn visage, and I could see that in his own mind he had little or no hope of the patient's recovery. Ellis was by far the most sanguine of the party, and, whenever we urged our gloomy forebodings upon him, invariably replied—"Yes, I know all that—it would have killed any other man, but it won't kill him. Wait a bit, and you'll see."

A fortnight had now elapsed, and the continued burden of his grief began to tell visibly upon Sir John. The ruddy hue of health faded from his cheeks; his eyes grew dim with weeping, his hands shook, and his firm manly step became feeble and uncertain; it seemed as if in that short space of time he had grown ten years older. My mother also began to look ill and harassed, and Fanny, though she still kept up wonderfully, and was the life and soul of us all, waxed paler and thinner every day, while for my own part, I could neither eat, drink, nor sleep to any efficient purpose, and divided my time between watching in the sick room, and pacing up and down the garden, beyond the precincts of which I never ventured, from a nervous dread lest any thing might go wrong in my absence.

On one occasion, Ellis, completely wearied out, had thrown himself on a sofa, to snatch an hour's repose, while I took his place by Harry's bed-side. It was between two and three o'clock in the morning, and the first rays of early dawn, stealing in through the partially closed shutters, and mingling with the faint glimmer of the night-lamp, shrew a pale and ghastly light over the surrounding objects, when I fancied that I heard my name pronounced in a low, scarcely audible voice. I glanced at Ellis, but his hard and regular breathing proved him to be sound asleep. I next turned towards

the bed where Harry lay, and, carefully shading the lamp with my hand, advanced with noiseless step towards it. As I approached, I perceived the patient's eyes were open, and, oh, happiness! once more animated by the mild light of reason—"Harry," whispered I, "did you call? Do you know me?" A faint smile passed across his pallid features, as he replied in a voice so weak and low, that I was obliged to stoop my head almost to a level with his lips, ere I could catch his words—"Know you, dear Frank? why not?" "Thank heaven," murmured I, "he is no longer delirious!" As I again turned towards him, he endeavoured to stretch out his hand to me, but his strength was unequal even to that slight exertion, and his arm dropped heavily by his side; as it did so, he spoke again—"Frank, what is all this? I cannot—I am very weak—very tired." "Lie still, dear Harry, and do not try to talk—it may do you harm. You have been very ill, but God in his mercy will soon, I trust, restore you to health." I then crossed over to Ellis's sofa, and laid my hand lightly upon his shoulder. "Oaklands is no longer delirious," said I, as he started up; "he knows me, and has spoken to me."—"Is he?—does he?—has he?" exclaimed Ellis, in an eager whisper. "I told you it would never kill him. Why didn't you call me before? but it's always the way; if I do by any chance fall asleep once in a week, there isn't another head properly so called in the whole house, they might as well be chair-nobs—Yes, I know," he continued, as I attempted to get in a word of explanation, "if you couldn't wake me before it happened, that doesn't prevent your giving me the medicine chest now, does it?"

I may as well take this opportunity of mentioning, that Ellis, though in the main one of the most good-natured fellows in the world, whenever he was particularly interested or excited, and had to act with promptitude and energy, became extremely cross and snappish, and was certain at such times to scold every one who came in his way, without the slightest regard to age, sex, or station. However, it was always over in two or three minutes, and I have seen him laugh till the tears ran down his face, when the rude things he had said were repeated to him afterwards. While he was staying with his brother at Cambridge, it used to be a favourite amusement with some of the men to start a subject which they knew would excite him, for the sake of "getting a rise out of the doctor," as they termed it. But I am digressing.

The medicine Ellis gave Harry threw him into a heavy sleep, from which he did not awake until late in the morning, when he appeared perfectly conscious. The fever had in great measure abated, and on Dr. Probehurt's arrival he was fain to confess a surprising improvement had taken place, and that, if not positively out of danger, the patient was in a fair way to become so. As for Ellis, he was exactly like one beside himself. He ran all over the house—into bedrooms and all sorts of places where he had not the slightest business, shaking hands with every one, and repeating, "I know it—I knew it—I always told you so—it would have killed any other man, but it couldn't kill him!"

Let us pass in silence over the first interview between Sir John Oaklands and his son. There are some of the deeper feelings of our nature, planted in our bosoms by the hand of God himself, which, when called forth to their fullest extent by the chances of life, reveal so clearly their divine origin, that those who witness their display stand reverently by, and, with throbbing hearts and averted eyes, bow the head as in the presence of some holy thing; and if such pure and sacred influences shed their lustre over that meeting, and the old man wept tears of deep and fervent thankfulness on the neck of the son whom he had, as it were, received from the dead, it shall not be for us, with sacrilegious hand, to remove the veil which shrouds from careless eyes the hallowed mysteries of feeling.

From that day Oaklands began to amend slowly, and,

at the end of another week, even the cautious Dr. Probehurt declared all immediate danger was over; for which admission however he took care fully to indemnify himself, by detailing at length every possible evil which might accrue for the future. The state of weakness, to which Harry's once herculean frame was reduced, was melancholy to witness; for many days he was unable to turn in his bed without assistance, and even when he began to recover his strength, it was by very slow and lingering degrees. Utterly unable to support himself, he was lifted from his bed to a sofa, and wheeled into the drawing-room, where all our powers of entertainment were called into requisition to relieve the monotony of such a state of existence. In doing this, little Fanny made herself pre-eminently useful; by a sort of intuition she appeared to divine every thing he could possibly want before he asked for it, and contrived to have it waiting his pleasure as if by magic; and yet it was done so quietly, that I believe Harry had not a notion to whom he was indebted for the forestallment of his every wish. Did his lips appear parched and dry from the low fever which still hung about him—unobserved by any one; Fanny would glide out of the room, and in another minute his servant would enter with a tray, containing jelly, lemonade, or some refreshment of a like nature, and Harry would say with a languid smile, that the fairies must have been at work, for that Wilson had brought him the very thing he was wishing for. As he grew stronger, and required less attention, I yielded to his request, and once more resumed my studies, reading doubly hard in order to make up for lost time. The duel had taken place early in June, but it was not until the latter end of August that the surgeons would allow of their patient's removal to the Hall. Under Ellis's directions a kind of litter was prepared, drawn by a stout Shetland pony, and hung upon a complicated arrangement of springs, by which means all possibility of jolting was avoided. With the assistance of this machine, Harry was enabled to take short airings in the park, and, when it was found that no ill effects ensued, a fine day was chosen, and Heathfield Hall swung wide its ample gates, to receive once more within its walls the heir of that noble property. It was a glad day for every one—the old servants shed mingled tears of joy and sorrow; of joy that their young master had been spared to come among them again, and of sorrow when they gazed on his pallid cheeks and long thin hands, and thought of the amount of suffering that manly frame must have undergone, ere it could have become such a wreck of its former self.

After his return home, Oaklands progressed very slowly; he had so far recovered as to walk about the house and garden with the assistance of Ellis's arm; but the wound in his side still presented an unsatisfactory appearance, and obstinately refused to heal. Ellis's skill and attention were unparalleled; he took the greatest interest in the case, and though he pretended that his zeal was entirely professional, yet it was clear the fascination which Harry seemed unconsciously to exercise over every one who became intimate with him, had subdued even the sturdy doctor, and that he had conceived a strong affection for his patient.

The only one of the party on whom the fatigue and anxiety appeared to have produced any lasting effect, was dear little Fanny, and she continued to look much more pale and thin than I liked to see her. Her spirits, also, seemed less gay and buoyant than usual, and when Sir John and Harry left us, and she had no longer any motive for exertion, a kind of languor came over her, producing a listless distaste for all her former employments; and she would sit for hours poring over one of the Italian poets, without exchanging a word with any one. In order, if possible, to rouse her from this state of apathy, I used every means in my power to interest and amuse her, but unfortunately my time was now so fully occupied that I had little leisure to bestow upon her. I was to take my degree at the commencement of

the new year; and, as I had made up my mind to try for honours, I had not a moment to lose, and read eight hours a day. The rest of my time was devoted to Sir John and Harry, (save an odd hour or two for a constitutional scamper with my gun through the preserves just to keep down the rabbits, or a gallop across the country, to prevent the hunters from getting too fat,) and our kind friends were never so well pleased as when they could persuade us all to come to them. My sister, however, seemed to prefer dreaming over her book to the exertion of accompanying us to the Hall, and even when she did so, appeared unequal to the labour of amusing Harry, and devoted herself to the more easy task of pleasing Sir John, who, happy beyond expression in the prospect of his son's recovery, was in high good humour with everybody and everything. Becoming at length far from satisfied about Fanny, I mentioned my uneasiness to my mother, who comforted me by the assurance, that she considered it merely the natural consequence of the fatigue and anxiety she had undergone, a sort of reaction of the spirits, for which time and rest would prove the most effectual cure.

And again the leaves upon the trees grew brown, presenting in their varied richness those exquisite shades of colouring that gladden a painter's eye,—and the swallows, those summer parasites, taking alarm at the first sharp blast from the North, had departed to prosecute their annual pursuit of sunshine under difficulties, leaving the honest robin redbreast to renew his friendship with the race of men,—when I, dissatisfied and anxious about those I was leaving behind me, and nervous in the highest degree as to the result of the struggle for distinction in which I was about to engage, once more took up my abode at Trinity.

Reader! there are pauses in the life of every one of us—seasons in which no perceptible change, either mental or bodily, takes place—lulls in the tempest of existence, which enable us to recruit our exhausted energies after the dangers we have surmounted, and brace our nerves for the coming struggle, in which we may be engaged we know not how soon. Such a pause, gentle reader, is now about to occur in this veracious history; should you have kindly taken sufficient interest in “the subject of this memoir” to feel surprised at hearing nothing further respecting him for a short period, let me beg you to imagine him very laudably employed in reading hard for his degree. Whether his labours will be productive of a successful result, or whether he is fated to the ignominy of being “plucked” for his pains, you shall be duly informed in the third and concluding portion of Frank Fairleigh.

NOTE.

It has been suggested to the author, that, after the strictures on duelling which he has placed in the mouth of Frank Fairleigh, he is guilty of inconsistency in allowing Oaklands to accept a challenge, and in placing Fairleigh himself in a situation in which he might have been compelled to fight a duel; and that, for these reasons, as example is always stronger than precept, his tale is calculated rather to encourage the practice than to dissuade men from it.

In reply to these objections he begs to remark, that his intention from the very beginning of the story, to which he has steadily adhered throughout, has been to describe things, not as he would have them, but as they really are, endeavouring, at the same time, by pointing out the evil which arises

from following impulse only, and the different results which ensue where principle is the guide, to do some little good in his generation. Thus, in the affair of the duel, he has endeavoured to carry out his intentions in the following manner:—

The reader must be aware that there is a marked distinction between the characters of Oaklands and Fairleigh. Oaklands acts solely from impulse, although, possessing naturally a high and generous disposition, his impulses usually lead him right, save where his two great faults, extreme indolence and an ungovernable temper, interfere to prevent it. Fairleigh, on the contrary, intends to act upon principle, and although, from the weakness of humanity, and the hasty passions of youth, he fails lamentably often, he sees his errors, endeavours to palliate their ill effects for the present, and to guard against them for the future. Through an act of Fairleigh's they become involved in a sort of compound quarrel with a noted duellist, and Fairleigh is placed in a most embarrassing situation; he must either fight a duel, a deed which he considers likely to “endanger his happiness here and hereafter,” and which he dreads accordingly, or he must submit not only to be branded as a coward, but to endure the double infamy of allowing his friend to sacrifice himself in his stead. Whether it was his duty to have done so, the author leaves to casuists more able than himself to determine, satisfied, that in making him earnestly repent the rashness which had involved him in the affair, and determine that if he must risk his own life, nothing shall induce him to attempt that of a fellow creature, he is describing a more natural course of action. On the other hand, Oaklands allows his animosity towards Wilford to overcome any scruples he may entertain against duelling without a struggle, and it is only at Frank's earnest entreaty, and after he had in great measure satisfied his revengeful feeling by the chastisement he had inflicted on his opponent, that he agrees not to return his fire. We know that the condition in which we are now placed is not one of temporal rewards and punishments, yet, even in this world, we are sometimes allowed (doubtless in mercy) to feel the consequences of our own rash actions, and Oaklands, in the pride of his matchless strength, is reduced to the helplessness of infancy, while grief lays the burden of years upon his father's ~~green~~ old age.

Surely no thinking person can read the account of Fairleigh's agony of mind, when he believes he may be forced to meet Wilford, “the misery, the self-reproach, the bitter penitence of that moment when he reflected on the fearful situation in which he had placed himself, a situation in which crime seemed forced upon him, and in which it appeared impossible for him to act rightly,” without being led to feel that duelling is alike repugnant to the will of God and the laws of man, while those (if such indeed there are) who look only to present consequences, may be led to pause ere they commit an act which may entail upon them the narrow escape from death, and the prolonged sufferings of

Oaklands. If the tale be indeed not calculated to excite these feelings, the author can only add his sorrow, that he should have so completely failed to express his deeply-rooted abhorrence of the unchristian practice which he has before designated as "a fashionable compound of murder and suicide."

THE WISH.

A FAIRY TALE.

CHAPTER VI.

TIME passed on; Robin and Alice became, by degrees, accustomed to their new way of life, but it did not lose its pleasures, though it lost some of its novelty.

Amongst the many enjoyments which they derived from their change of circumstances, was the possession of books. Of these, at first, they could understand but little; but, as they read more, their minds became better informed, and their desire for knowledge increased; and they both enjoyed the long winter evenings, when, whilst Alice sat at her work, Robin read aloud to her some book of amusement or instruction.

In the course of a few weeks they became acquainted with several families who lived in their neighbourhood. Nor were the poor forgotten; they constantly devoted a large portion of their wealth to the relief of the sick and indigent.

Respected by the rich, blessed by the poor, the Maynards of "Fairy Hill Court" were general favourites. Months passed on, and still they were happy and beloved.

At length the time drew near when the fairy's second visit was to be made, Robin's second wish to be heard, and his now yet empty coffers replenished.

It was evening, the supper,—for in those days supper was the most cheerful and pleasant meal of the day,—the supper had been removed; Robin and his wife sat by the blazing fire. Robin had not taken up his book to read as usual, and Alice had allowed her work to drop listlessly from her hand. Robin thought of their situation at that time the year before; of the anxiety, the cold, the hunger, they had endured, and then he looked around at the comforts of his happy home; and his heart was full.

"Alice, my love," he at length said, "what are you thinking of? You do not look as if you felt as happy as I do."

"Yes, dear Robin, I am happy," replied Alice, "very happy."

"Then why do you look so very serious?" said Robin, half playfully, and half anxiously, as he passed his arm round her slender waist, and gently drew her towards him.

"I have been thinking," replied Alice, "of one thing in which we have not quite followed the fairy's injunctions."

"What can that be, my love? Surely we have been moderate in our desires; and consider how much we have given to the poor,—what is wanting yet?"

"Why, I will tell you, Robin, what I have been thinking about; it has pressed heavily upon my mind for some time. Do you remember your old friend, Walter Collins, the carpenter, whom you always liked so much, who helped to nurse you when you had the fever; and his wife, poor Mary, who took care of my baby, while I was too much engaged with your illness to attend to it as much as usual, and it was pining, and, I believe, would have died, but for her kindness. Well, during all our prosperity, we have never once thought of them."

"You are right, Alice, we have not done as we would be done by. But how can we repair our neglect? Shall we seek them out, and give them half the contents of our treasure chests next year?"

"That would be a very good plan," rejoined his wife, smiling, "but I think I know a better."

"Do you? Well, let us hear it."

"Why, you know, dear Robin, this night at twelve o'clock you are to make your second request."

"I have it!" interrupted Robin, "I will ask the fairy to make them as rich as we are, and to bring them here that we may have them for neighbours. You know that beautiful house which has been uninhabited ever since we have been here,—'Elfin Lodge' it is called; how delightful it would be for them to find themselves there some fine morning!"

"Yes, how I should like to be invisible, in some corner, to enjoy their surprise," rejoined Alice; "and only fancy," she added, laughing, "how Walter would stare about him, and then begin to handle all the pretty things with his dirty fingers! And then, how happy poor Mary would be! I hope this is not a forbidden request."

CHAPTER VII.

Before twelve o'clock, Robin took out his golden key, and hastened to the vaulted chamber.

Punctual to his promise, the fairy appeared as the hour sounded. He filled the coffers as before, and then Robin made known his wish. The bright zone shone more brightly than ever, and, with an approving smile, he pronounced the welcome words, "Thy wish, thy request is granted!" and vanished.

The next morning symptoms of a recent arrival were visible at Elfin Lodge. Smoke was seen curling through many chimneys, and servants hurried to and fro. Robin and Alice lost no time in renewing their acquaintance with their old friends. They were not at first recognised by Walter and his wife, but they soon made themselves known. After the expressions of mutual satisfaction at meeting were over, Collins endeavoured to account for the change in his circumstances by pretending that a fortune had been left him by a distant relative. Robin felt disappointed in his friend, but he was too generous to inform him of the part he had himself taken in occasioning his good fortune.

Walter was of course anxious to know how the change in Robin's affairs had been brought about, and Robin, after exacting a promise of secrecy, told him all that had taken place, only suppressing the part which related to Walter and Mary.

There are some flowers, which, as long as they remain in their native shade, with their blossoms only peeping forth, with drooping head and closed petals, from beneath the shelter of their thick foliage, appear brightly tinted and sweet; but, when the sun shines on them and draws them forth from their hiding place, and they unfold their leaves, and raise their modest heads to the light of day—all their beauty, all their fragrance is gone, and the unfolded petals only disclose the hollowness within.

So it was with the character and temper of Walter Collins. While he was poor and neglected, he was humble, and, when he had nothing to give, he was good-natured; but no sooner had the sun of prosperity shone upon him than he became proud and hard-hearted.

This change, however, did not show itself all at once; it came on by degrees, and the warm-hearted Robin and his gentle wife were little inclined to think ill of their old friend.

The neighbours were on the most intimate terms; the gentlemen hunted, and fished, and dined together; and the ladies walked, and worked, and talked together; on the whole, things went on pleasantly enough for a time. Robin, it is true, felt vexed sometimes, that Walter seemed to take so little interest in his plans for promoting the comfort and improvement of his poorer neighbours; and Alice would have been glad, if Mary had not been always poorly or busy, when she asked her to accompany her in her visits to the abodes of suffering and want.

At length the fatal pride and envy, which were gradually

gaining possession of Walter's heart, began to show themselves in many ways. Whatever the Maynards had, the Collinses were never satisfied till they could procure something better and more costly. Nor was this all; though Walter did not in direct terms betray Robin's secret, yet he was so desirous of degrading him in the eyes of their mutual friends, that he was continually letting fall mysterious hints concerning his former life, so that an idea by degrees prevailed, that there was something not right about the Maynards, and they found themselves looked upon with an eye of suspicion and distrust.

All this was a source of deep grief and anxiety to Robin and Alice. At first they endeavoured by kindness and good offices to win back their friend; but, the more they tried to conciliate him, the more insolent and overbearing he became.

By degrees somewhat of this bad spirit began to communicate itself to Robin, and, though still far more sinned against than sinning, yet he was not entirely free from blame. The constant indulgence of this envious rivalry between the two families was also a heavy tax upon Robin's purse; and he found every month that he could spare less and less to his poor penitents.

CHAPTER VIII.

THINGS were in this state, and the year was drawing to a close, when Robin and Alice received an invitation to a grand entertainment which Walter was about to give in honour of the christening of his first son. Alice was prevented, by a slight indisposition, from being of the party; and, indeed, she was not sorry for the excuse to remain away, for her intercourse with the Collins family had become anything but pleasant to her.

As Robin bade his wife farewell, she begged him not to forget to return before twelve; "for remember," said she, "to-night your *third* request is to be made." Robin sighed, as he thought how much happier and better he had been a year before, and he said almost sullenly, "I shall ask nothing more."

When Robin arrived at Elfin Lodge, he found preparations on a most magnificent scale for a splendid banquet. His host received him in the presence of the other guests with a condescending air, and then utterly neglected him. Well would it have been for both had he continued to do so; but after dinner, when the ladies had retired, and Walter had, in some degree, become heated with the wine which was circulating freely, he seemed to delight in making Robin the object of his insolent sarcasms; woe succeeded sneer, and one insulting jest was followed by another. Robin's generous forbearance was attributed to cowardice, and only served to embitter Walter's unmanly attacks upon his character and conduct. At length, when some coarse personality, directed against Robin, had drawn upon him the ridicule of the now half-intoxicated guests, he leaned across the corner of the table which separated him from Collins, and said in an under tone, "Do not carry this too far, Walter, or you may repent it."

Walter started from his seat, pale with rage; and, pointing with his outstretched finger to Robin, he exclaimed, "Listen, my friends; this base-born scoundrel threatens me! He tells me I shall repent. Look at him; and I will tell you *who he is*, who dares to insult a gentleman in his own house! He is a foundling brat, brought up to the trade of a cobbler, and rescued from starvation by a fairy godfather."

A smile of contempt passed from one guest to another, and they looked as much as to say—"I thought so!"

But they had no time for comments. Robin, who was now as much beside himself with passion as his enemy, had also risen from his seat, and, with his eyes flashing and lips quivering, he cried—"Coward! I do not hurl thee from thy pinnacle of pride, and crush thee in the dust, because I have sweeter vengeance in store. *Think of me to-morrow!*" Saying this he strode from the apartment.

Walter concealed his inward trepidation under a smile of derision; and, turning to an attendant, ordered him to "see that man safe out of the premises."

Robin walked rapidly home with "a fire in his heart, and a fire in his brain." He arrived at his own house just as the hour of twelve was sounding from the clock of the village church. All was calm and peaceful around; the soft moonbeams played over the ivy-clad tower, and glittered on the white graves below; but Robin heeded it not: on he rushed with frantic steps, and at length he reached the vaulted chamber. The fairy was already there. Robin paused not to observe the dimmed light of the starry belt, or the mournful expression of his visitor's countenance; but, with a voice hardly articulate from passion, he exclaimed—"I demand of thee to take from Walter Collins the wealth he has so misused, and plunge him in his former poverty."

The light waned yet more dim; and the fairy's countenance assumed an awful sternness, as he said—"Thy wish is granted!"

The fairy disappeared; and Robin sank down in a state of insensibility upon the stone floor.

CHAPTER IX.

BUT too soon, alas! Robin recovered from his trance. It was morning; and, as he by degrees recovered his senses and looked around, he became aware of the dreadful change which had taken place.

He lay on his old mattress, in his old cottage, surrounded by poverty and want. Poor Alice was calmly sleeping, unconscious of the sorrow that awaited her. The wailings of her child aroused her from a dream of peace and joy. She gazed at the sad scene too much bewildered fully to comprehend it; but the mournful truth was soon too evident to her; and Robin, amidst tears and bitter self-reproaches, told her all that had happened—how he had fostered and indulged his growing hatred of Walter, till it was ready to burst forth at the first provocation; and how, blinded by passion, he had forgotten the fairy's precept, and wished the fatal wish,—*Ill to his neighbour!*

Alice could not restrain her tears, but she loved her husband too well to reproach him with an error of which he had already so deeply repented. She arose from her humble couch, attired herself once more in the coarse garments of poverty, and then endeavoured by her caresses to soothe the clamorous sorrow of her little boy, who was crying loudly for his breakfast.

Whilst Alice was thus employed, she was startled by something falling at her feet; and, to her great joy, she beheld her purse. How it came there she never knew. Probably the fairy had relented so far as to grant this small supply for their immediate wants; it contained two or three gold coins and some silver. Little indeed, but yet sufficient to save them from perishing with want before Robin could earn anything by his labour.

Alice took from her small hoard as much as was necessary to purchase some bread, and went to the nearest baker's shop. The baker was a stranger, and, of course, did not recognise her; but, as she was returning, she met one of her former neighbours, who greeted her with—"So, you are come back again, Mistress Maynard; well, you don't look much better off than before you went." Alice simply said, "we have again been unfortunate." The neighbour shrugged his shoulders, and bade her good morning, and Alice proceeded home.

And what became of Walter and Mary Collins? The same sad change had taken place in their circumstances. They had opened their eyes that morning on a scene of squalid misery, far worse than that to which Robin and Alice were reduced.

Walter had been carried the previous night, to his luxurious couch, stupified by intoxication. When he recovered his consciousness, his aching head was resting on a pillow of straw, in a dreary wretched apartment; his ears were assailed by the bitter complaints of his wife, and the cries of his helpless little ones. Woe and

wallings were around him, remorse and despair in his heart. Not only was Walter reduced to his former poverty, but he had not received the small relief which had been granted to the good Alice, by the restoration of her purse. Besides this, both Walter and Mary had, during their prosperity, given way to sloth and self-indulgence; therefore they were quite unfitted for any exertion.

Mary could do nothing but weep, and Walter sat in sullen silence, resting his burning temples on his hands, and only occasionally rousing himself, to silence, with fierce threats, the importunities of his hungry children.

The day was far advanced, and things were still in the same sad state, when a gentle knock was heard at the door. "Come in," said Walter, in a surly tone. The latch was raised, and Alice stood before them.

"Are you come to mock our sorrows!" exclaimed Walter, bitterly.

"God forbid!" replied Alice; "but I bring you food, and money to buy more," and she handed a basket to Mary, who was instantly surrounded by her famishing children, who with clamorous eagerness seized and devoured the bread which she distributed amongst them.

Walter looked on, with a morose and gloomy countenance. It was a hard struggle between his pride and his wants. But hunger prevailed, and he received the food which Alice had brought, though not with thanks, yet with a sort of sullen resignation.

On her return Alice found her husband busily employed; during her absence he had procured some materials, and now he had set in good earnest to work at his old trade.

When it was known that Robin was come back, he soon got plenty of work. The shoemaker who had set up in his absence was idle and drunken, and, finding that no one would employ him after Robin's return, he went away to try his luck elsewhere.

CHAPTER X.

Time rolled on; and, when the end of the year approached, it found Robin and his wife contented, and in tolerably prosperous circumstances. They had been able by degrees to supply the place of most of the furniture, which during their former distress they had been obliged to part with; and their cottage had again assumed a neat and cheerful aspect. Robin would have been quite happy, but remorse kept its place in his heart, and he could not be at rest; and, whenever he beheld the care-worn, sorrowful faces of Walter Collins and his wretched wife, and half-naked little ones, he felt, that no sacrifice would be too heavy, if by it, he could restore to them, what, in a moment of anger, he had deprived them of.

Again the anniversary of the memorable day had arrived. The frugal supper had been removed, and the small oaken table drawn near to the fire, and by it sat Robin and his beloved Alice.

Robin was a wiser, and a better, though a sadder man. He had learned how a fault, committed in a moment of unguarded passion, may destroy that peace which the repentance of a whole life cannot restore. "What would I not give," he said, "if the fairy would but grant me one more request!"

"Dearest Robin, you would not ask —"

"I would not ask for worldly riches," interrupted Robin; "no, I would entreat him to give me back my peace—to destroy this demon which is gnawing at my heart, by restoring to poor Walter, and his helpless babes, the wealth, which in an evil hour I took from them; but it is all in vain," and Robin covered his face with his hands, and sighed deeply.

"Robin," said Alice, after a long silence, "The fairy told us he would not answer again to your call, or grant any future request of yours; but he did not say he would not come if I sought him, or grant my wish. Suppose I were to raise the stone."

"You, Alice! you could not move that heavy stone."

"I will try at least," said Alice, and she proceeded to remove the earth from the edge of the stone, as she had seen her husband do, on a former occasion.

Scarcely had she commenced her efforts, when the stone began to move, and in another moment it slowly rose from its resting place. Alice drew up the trap door, and the fairy stood before her, repeating the same words as before, in the same soft cadence, "Mortal! thou hast sought me, thou hast found me; what is thy will?"

Alice was so much overcome by surprise and delight at the success of her attempt, that all she could do was to burst into tears, repeating the name of Walter,—

"Listen!" said the fairy. "It is in my power to grant to thee but one wish. It is only to those who have been placed under my special care, that I can grant three requests. I give thee permission to reconsider thy wish, and to consult with thy husband, before thy final decision is made. Remember, if I restore Walter Collins to wealth at thy desire, thou wilt be left in poverty."

"Poverty is light compared to the weight of an uneasy conscience," said Robin. "We have enough for our wants, only give me back my peace. Ask him, dear Alice, to restore Walter's wealth to him, and we will be happy in our poverty."

The request was made, and the welcome words, "Thy will, thy wish is granted," were heard with unmixed joy, by the now happy couple. But the fairy did not vanish as usual, he remained gazing on them with a beaming countenance. Once more he spoke, and these were his words: "Mortals! Though I had only the power to grant to thee one request, I have yet the power of bestowing upon thee a boon unasked; I therefore give thee back all that thou hast lost! and thou art worthy to enjoy it, for thou hast learnt to be moderate in thy desires, and to do as thou wouldst be done by. Farewell!"

M. A. S.

LIFE AND CHARACTER OF JOHN FOSTER.¹

FOSTER'S eccentricities were not, however, opposed to the cultivation of studious habits, and so frequently did he meditate in one favourite path near Chichester, that the spot is still called "Foster's Walk," and the brick flooring of his chapel is said to retain the marks of incessant pæciings up and down, during the tranquillity of moonlight nights, when the pale spectral-like light aided his meditations. In such a place, and at such a time, we suppose him to have framed those remarks on Coleridge which we find in his journal. "The eloquent Coleridge sometimes retires into a sublime mysticism of thought; he robes himself in moonlight, and moves among images of which we cannot be assured for a while whether they are substantial forms of sense, or fantastic visions." The quietude so loved by Foster was favourable to that contemplativeness which he earnestly cultivated in himself, and strongly recommended to others; and which tended still more to alienate him from the activity of life. Writing to a friend who had expressed a high degree of respect for men of energetic and practical habits, he says, "I cannot join in your reverence for that amazing busy activity of the world. Is it cynical to ask, What is effected by it all? Much of this huge bustle seems to be as important, if it were as innocent, as the ripping of a rill, or the frisking of a company of summer flies. If I had the power of touching a large portion of mankind with a spell amid all this insane activity, it should be this short sentence, 'Be quiet, be quiet.'"

Such a man was more likely to luxuriate in his meditations in the stillness of the grove, or the solitude of his room, than to seek popularity by a course of bustling effort amongst the good folks of Chichester, from whence, after remaining about two years and a half, he retired to Downend, four miles from Bristol. This spot was endeared to Foster by its association with the musings of Coleridge, whose far-stretching speculations

(1) Concluded from page 400.

and musical eloquence gave to him a delight of the same kind with that derived from the poetries of Nature, the deep voices of the sea, or that melody which whispers to the imaginative mind the mysteries of the stars. Downend, therefore, was at first liked by Foster, whose imagination was impressed by the consciousness that the trees on which he daily gazed, had fed the thoughts of Coleridge; and here he resided about four years, training his powers by hard and even laborious thinking. But he was not to remain fixed, for the simple reason that no village or town was wholly inhabited by John Fosters, but by respectable, plodding drapers, butchers, bakers, and such solid items of the social system. With these good men, worthy as they were, Foster could not get on,—his region of thought was not theirs; hence the constant changes of place, from Newcastle to Dublin, thence to Chichester, to Downend, and from this place to Frome, whither he was invited by a small congregation. Whilst in this town, a deep melancholy would, at times, steal over him, produced by the painful consciousness of his isolation from men, and the dread lest the energies he felt working within should never find an utterance. A kind of exclusiveness, a dislike to human society of the common order, was fast becoming ingrained into his nature, threatening to plunge him into the gloomiest depths of misanthropy; he felt that the age was against him, that the wide world, with all its multiplied coteries and literary clanships, seemed suspicious of him.

From the sad consequences of this gloomy feeling he was partly saved by that love for nature which still brought to his view many precious visions. Frome itself he hated, and hastened from its streets to green lanes and bubbling rivulets, as the following passage to a friend significantly intimates. "As to the town itself, I do not know whether I told you how much I nauseate it, but no length of time will ever cure my loathing of it. But sweet Nature! I have conversed with her with inexpressible luxury. A flower, a bird, a tree, a fly, has been enough to kindle a delightful train of ideas and emotions, and sometimes to elevate the mind to sublime conception. When the Autumn stole on, I observed it with the most vigilant attention, and felt a pensive regret to see those forms of beauty, which tell that all the beauty is soon going to depart."

Foster now began to try his fortune in the world of literature, and sent from his retirement at Frome the famous "Essays" to the press; these soon procured him that fame and sympathy which could not fail of delighting a mind constituted like his. Some readers might deem those compositions hard to be understood, and class them amongst "dull books," but the thoughtful and educated of all orders received with delight those productions of so able a thinker.

We shall not pause here to analyse these compositions, as a few lines on them will form a suitable close to this article.

The idea of writing these essays was suggested to the author in the course of a conversation with the lady whom he subsequently married, a fact well worthy of note in the history of these pieces. They were in their original form written to her, a circumstance indicating the possession of tastes and abilities kindred to those of Foster himself, and proving her fitness to be the wife of such a man. Becoming more deeply engaged in literary pursuits, Foster left Frome in 1806, and began to prepare for his marriage, an event which contributed so highly to his happiness, and prevented the further development of that melancholy spirit which had been stealing over him. He was married in May, 1808, being then thirty-seven years old, and the lady six years his junior. Foster took up his abode at Bourton, in Gloucestershire, his wife's place of residence before she was married, and both began a vigorous course of mental exertion. Foster now became an author of high consideration, for, though the multitude did not hail

him as one of their pet writers, he was the favourite with those who delighted in the poetic discursiveness of Coleridge, or the moral beauty of Wordsworth: people began to mention him familiarly, not as Mr. Foster, but with a simple emphasis, as "John Foster;" and the *Essays* soon found their way into literary circles, passing through numerous editions, and so tending to urge on the progress of the human understanding by the hints and suggestions thrown out, like signal lights on a dangerous coast, for the guidance of men. Periodical literature now absorbed much of his time, and some have regretted that a mind, capable of producing an intellectual pyramid for all ages, should have been absorbed in erecting, month by month, a number of trifling works, serving, in most cases, but the purposes of the present hour. However, many of these miscellaneous reviews exhibit proofs of the most powerful and original thinking, clothed in a forcible style, and illuminated by the splendours of a rich imagination.

Thus occupied, Foster's life passed with few of the events called "startling" to colour its different epochs, and mark more vividly its contrasts. His study at Bourton, a long narrow garret, furnished him with the means of preparing rich repasts of thought for himself and others, and beyond its walls he rarely wandered, except on calm summer days in company with his wife, to gather from the lights and shadows of natural scenery those colourings which were afterwards moulded into the forcible imagery of his essays or reviews.

About the year 1817 he returned to Downend, bearing with him a name very different from that which had distinguished him during his former residence in that place, when most persons thought him an odd compound of eccentricity and ability, in which the former much predominated.

In 1820, his essay on "The Evils of Popular Ignorance" appeared, in which he depicts with his peculiarly powerful painting the degradation of a people crushed and blighted by ignorance, and contributed to rouse men of all parties to a thoughtful survey of the great masses of mankind, and to the adoption of means by which the fatal consequences of error, long working in the midst of populous multitudes, might be obviated.

Foster, in 1821, once more changed his place of residence; he removed to a pleasant village named Stapleton, about three miles from Bristol, where his subsequent labours were prosecuted, and his remaining days passed. Some of his noblest productions came from that quiet, solitary-looking house, begirt with its massive walls of time-worn and moss-covered stones, which stands on the left hand of the road as the passenger enters Stapleton from Bristol. It seemed a fit home for Foster, massive and sombre, without a particle of modish pretension, and looking as if those rough stones robed in lichen had something of the poetic spirit in them. This abode witnessed some of Foster's acutest trials; here his wife, the fond and faithful companion of his joys and sorrows, slowly sunk until death completed the sad work which disease had for years been preparing. Again he felt the cruel melancholy of his former loneliness; for neither children nor friends could compensate for her loss whose sympathy had been to Foster a species of inspiration, infusing hope amid his despondency, and holding a bright light to his spirit, when, tossed by its speculations, it too often wandered near the dark regions of mystery. Some portion of the sorrow which her death produced may be gained from such passages as this:—"Left quite alone for some hours in the house, I have been walking about the rooms, and looking at the various objects, the fire-place, the prints suspended round the walls, with the mournful consideration she will see these apartments—will be seen in them—no more; there is a strange sinking of the heart at the thought." What a touching image of a desolate spirit is this! The first moment Foster finds himself freed from observation, he leaves his study, and, passing through the deserted rooms, gazed on the

symbols of that being, now far, far away, and sees the whole of her past life rise in vivid distinctness as scene after scene appears at the suggestive call of that book, or this chair, which tell so touchingly of the dead.

After such a deprivation, Foster's mind was more than ever disposed to hover around the mysteries of departed spirits; what they were feeling or doing was ever in his thoughts, or rather what *she* might be feeling and doing. His love for ruins, for places buried in the deep quietude which the voices of the world never disturbed, returned, and to be far from the sight of houses seemed a luxury. The village in which he dwelt could not be called populous, but its attractions would have been greater for Foster had all its neat residences been suddenly changed into ivied ruins, the moss-covered and time-broken walls of which could have held communion with his spirit. Often has the writer of this article met him in a lonely valley about two miles beyond Stapleton, where a stream rolled silently between masses of rock, the huge and time-blackened slabs of which, projecting from the enormous roots of ancient trees, seemed like the torn and desolate wreck of a mountain region. In summer evenings, just as the sun threw his warm light upon the foliage along the face of the cliffs, and brought into full view the deserted mill at the bottom of the vale, and shed beauty upon a huge pile of black rock, towering above the stream, Foster was often met by one accustomed at the same time to seek the romantic beauties of the spot. Slowly, by the side of the stream covered with thousands of water-lilies, was the stooping, thoughtful form of the essayist seen to advance. The writer and he on such occasions never exchanged but a passing salute, for it would have been the height of cruelty to have disturbed his meditations in this solitude, which had been singled out as offering the retirement he loved. Glad was the writer to find that the presence of another in this wildly beautiful spot did not scare Foster from his walk, though it would have been difficult to find another so appropriate to his meditative mind in the immediate vicinity of Stapleton; for the mill, and that abandoned, the wild banks, the stillness of the stream, the deep shade of the trees, contrasted with the vivid green of a narrow slip of mead, presented that combination most adapted to Foster's taste. None could disturb him here, where few, save the simple peasants, wending to the distant hamlet at eventide, were seen; and these gave Foster no annoyance. He did not flee from the simplicity of nature, but the affectations of art; the rustic in the path was never avoided, though the circuit of a mile would have been made to escape the intrusion of some modish gentleman.

This quiet spot is now left for other thoughtful wanderers. Foster's footsteps have not of late pressed the turf, and long will it be ere such another frequenter of the vale will admire its beauties. He was now gradually withdrawing himself from the business of earth, for seventy years began to affect both his bodily and mental powers, his eyes and memory were failing, thus threatening him with an isolation, not only from the visible forms of nature, but from the stores acquired by reading. Slowly, but surely, the end was approaching, and descending from one degree of weakness to another, he gradually drew near to the event which through the whole of life Foster had constantly kept in view. The year 1843 was the limit to Foster's earthly career; for then, on the 14th of October, he departed this life for that which had so often occupied his meditations, leaving a name which the lovers of original thinking and earnest thoughtfulness will not quickly forget.

The essays, by the publication of which Foster first attracted the notice of the world, are four: the first being "On a Man's writing Memoirs of himself," in which he develops, through a series of seven letters, the deep knowledge of the mind's secret workings with which his habitual thoughtfulness made him familiar. He imagines

various persons writing their own memoirs, and revealing, for the solemn scrutiny of men, the secrets of their past lives, and especially the *courses of training* by which their characters had been formed. He then instances the kind of process through which a misanthrope, a prejudiced thinker, a tyrant, and an atheist, have passed, describing the influences which had perverted the intellect and heart of the latter. The following *terse* irony on the easy stages by which some have reached the degrading depths of atheism, will give a notion of Foster's peculiar style. "It was not strange if this man read with avidity a few of the writers who have attempted the last achievement of presumptuous man. After inspecting these pages awhile, he raised his eyes, and the great spirit was gone. Mighty transformation of all things! The luminaries of heaven no longer shone with his splendour; the adorned earth no longer looked fair with his beauty; the darkness of night had ceased to be rendered solemn by his majesty; life and thought were not an effect of his all-pervading energy; it was not his providence that supported an infinite charge of dependent beings; his empire of justice no longer spread over the universe; nor had even that universe sprung from his all-creating power."—Again, "The wonder then turns on the great process by which a man could grow to the immense intelligence which can know that there is no God. What ages and what lights are requisite for this attainment! This intelligence involves the very attributes of Divinity, while a God is denied. For unless this man is omnipresent, unless he is at this moment in every place in the universe, he cannot know but there may be in some place manifestations of a Deity, by which even he would be overpowered. If he does not know every agent in the universe, the one that he does not know may be God. If he is not himself the chief agent in the universe, and does not know what is so, that which is so may be God. If he does not know every thing that has been done in the immeasurable ages that are past, some things may have been done by a God. Thus, unless he knows all things, that is, precludes all other divine existence by being Deity himself, he cannot know that the being whose existence he rejects does not exist."

The second essay is "On decision of character," which rare quality he exemplifies in a variety of modes, exhibiting the miserable consequences attending its absence, and instancing examples of this high quality in the men whose names shine out from the crowd on the long roll of history.

The third essay is entitled, "On the application of the epithet Romantic," in which Foster details the mischievous consequences of an *undue* tendency to the imaginative in the affairs of life, and the evil of Utopian schemes in literature, politics, and in religious efforts for the advancement of Christianity.

The last essay contains a series of just reflections "On some of the causes by which evangelical religion has been rendered unacceptable to persons of cultivated tastes." In this he exposes the low tone of thought, and feebleness of style, characterizing much of the printed theology and popular Divinity. These essays, with his treatise on "Popular Ignorance," and his "Discourses," to which must now be added his "Journal," are the materials from which a full estimate of his character must be formed.

What are the principal outlines of Foster's intellectual and moral character? A sombre grandeur, such as Milton often dwelt in, is one especial mark of his mind, which appeared ever at home in the midst of those shadowy mysteries where the soul, by long watching, perceives forms of infinite brightness and purity. Such minds love a home on the outside of the world, and a fellowship with the spirits that walk unseen this earth. This is not the grandeur of mere imagery, but of solid thought, making the reader feel as if treading holy ground, and listening to the voices of mighty

spirits. Such loftiness of meditation and amplitude of range are especially seen in some of his discourses, in which Foster moves amid the dread solemnities of religious verities.

Great subtlety is also joined, in Foster, to grandeur of imagination, and this enabled him to detect the secret workings of thought, and note the peculiarities of his own inner life, with a distinctness far greater than that with which ordinary men observe the most common facts of their daily life. His command of beautiful and appropriate imagery was remarkable, and all parts of his writings bear witness to the employment of illustrations drawn alike from the simplest objects of life, and the grandest forms of nature. The rustic bridge over the lonely stream, the trunk of a leafless tree, the dust raised by the wind, and the bright beauty of the midnight heavens, are all in turn employed to suggest ideas, or enshrine a powerful reflection. Many, when reading Foster's writings, are somewhat surprised to find "so little imagination" in the pages, and deem it "rather dry," but these forget that imagination may be employed on loftier objects than the mere trappings of wordiness. Great thoughts are often brought down from on high by imagination's aid, as Franklin conducted lightning from the skies by his line. This faculty was in Foster the auxiliary of thought, not its substitute. His love of natural beauty proceeded from this vigorous and healthy tone of his imagination, which enabled him to see the rich colourings and diversified beauties of scenery, so as to employ them for the enrichment of his style, and illustration of his thoughts. He was thus ever feeding his mind with the suggestions and images furnished by woods, mountains, and rivers, and this oratory of the visible universe has been well rendered by him in many of those compact masses of illuminated reflection which often compel the reader to pause, and peruse again the expressive sentence.

It may now be asked, What has Foster done for the advancement of knowledge and the improvement of mankind? Little, *perhaps*, if we contrast his powers with the *visible* results of his life; but the same conclusion was made in the case of Coleridge; though it must not be supposed that such minds have passed through a long course, and, like shooting stars, left no trace of good behind. If a check has been given to frivolity, and many minds have been called from trifling pursuits to manly habits of thought, a great good has been accomplished, and the seeds of future blessings sown upon the earth. Such an end, it is presumed, Foster laboured to effect; nor will a considerate man deem him to have failed. Thousands must have had their intellectual faculties braced and hardened for the great work of life by his teaching, and vast numbers may yet derive similar benefits from his instruction. We must not regard every man a useless labourer who does not produce some novelty which we may touch or see; as some discovery in physical science, a new kind of steam engine, or a fresh explanation of astronomical phenomena. Such a mode of estimating will exclude from the ranks of the *useful* a Milton, a Shakspeare, and a Wordsworth. It is true we may regret that Foster isolated himself by eccentricity, or let us say nervous, peculiarities, from the great masses of mankind; but this insularity was a result of his peculiar genius, and formed a part of the man's character. Others will still more strongly grieve that the *nature* of his theological views should have disposed him to keep aloof from, and even to attack, those long-established forms in which religious truths have been handed down to us from remote ages. A third party of readers will condemn the vehement impulses which too frequently carried Foster away from just conclusions, and separated his force of thought from correct judgment. But, amidst all these regrets, let us not forget the originality and simple-mindedness of this distinguished writer, nor hide his merits behind his faults, so that the former shall become wholly obscured by the latter.

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne*.

THIS I know, not only by reading books in my study, but also by experience of life abroad in the world, that those which be commonly the wisest, best learned, and best men also, when they were old, were never commonly the quickest of wit when they were young. Quick wits be apt to take, unapt to keep; soon hot and desirous of this and that, as soon cold and weary of the same again; more quick to enter speedily than able to pierce far; even like our sharp tools, whose edges be very soon turned . . . Also for manners and life quick wits commonly be in desire new-fangled, in purpose inconstant, light to promise any thing, ready to forget every thing, both benefit and injury, and thereby neither fast to friend nor fearful to foe; inquisitive of every trifle, not secret in the greatest affairs; bold with any person, busy in every manner: soothing such as be present, whipping any that is absent:—of nature, always flattering their betters, envying their equals, despising their inferiors; and by quickness of wit, very quick and ready to like none so well as themselves. Contrariwise, a wit in youth that is not over dull, heavy, knotty and lumpish, but hard, tough, though somewhat stuffish,—such a wit, I say, if it be at the first well handled by the mother, and rightly smoothed and wrought by the schoolmaster, both for learning and whole course of living, proveth always the best. Hard wits be hard to receive, but sure to keep; painful without weariness, heedful without wavering, constant without new-fangledness; bearing heavy things, though not lightly, yet willingly; entering hard things, though not easily, yet deeply; and so come to that perfectness of learning in the end that quick wits seem in hope, but do not indeed ever attain unto. Also, for manner, and life, hard wits commonly are hardly carried, either to desire every new thing, or to marvel at every strange thing; therefore they be careful and diligent in their own matters, not curious and busy in other men's affairs; and so they become wise themselves, and also are counted honest by others. They be grave, steadfast, silent of tongue, secret of heart; not hasty in making, but constant in keeping, any promise; not rash in uttering, but wary in considering every matter, and thereby not quick in speaking, but deep of judgment, whether they write or give counsel on weighty affairs. And these be men that become in the end, both most happy for themselves, and also most esteemed abroad in the world.—*Roger Ascham*.

ERRATA.

In the stanzas entitled "A True Tale," which appeared in No. 74, the reader is requested to correct the following mistakes:—

Verse 4, line 2,—for "fair cadence" read "far cadence."
Verse 10, line 1,—for "frontal" read "fontal."

N.B.—A Stamped Edition of this Periodical can be forwarded free of postage on application to the Publisher, for the convenience of parties residing at a distance, 2s. 6d. per quarter.

PREFACE.

WE have so fully entered into detail, in the Address presented to our Subscribers in the columns of our last number for October, and explained so minutely our arrangements and intentions for the future, that little more remains for us to add.

Actuated by a sincere desire to advance the cause of truth and right principle, by striving, while we amuse, insensibly to instruct and elevate the minds of our readers, we have expressed a not unreasonable hope, that our endeavours will be met in the same spirit in which they are made, and that all good men and true will, by according us their support and assistance, advance the good cause, and enable us to extend the sphere of our usefulness. And that the task we have assigned ourselves, viz., that of providing wholesome food for the minds of the thousands whose sole reading consists of the cheap periodical literature of the age, is no light or unimportant one, our experience tends daily and hourly to convince us. The only alterations we propose making in the general conduct of the Magazine are, that we hope to introduce a higher and purer style of writing than has hitherto been observable in our pages ; that in the tales and stories inserted from time to time, a deeper and more elevated tone of feeling will be perceptible ; that we shall give more frequent notices and reviews of new publications, and that in every article we shall write with a view to cultivate the honest common sense, and instil the upright, healthy spirit which so peculiarly distinguishes the English character. To that clear good sense and sound judgment we confidently submit our pages ; only requesting our readers, if their opinion should prove favourable to us, to *take us in*, and advise their friends to do so likewise,—an equivocal recommendation, by the way, which we rely on their honesty not to misinterpret.

One word more, and we have done : should certain papers of a more humorous cast than have yet appeared in our columns be occasionally inserted, we must entreat our more sober-minded readers to pause ere they condemn us on this account, till opportunity shall have been afforded us to prove that our wit is tempered with discretion, and that, though always ready to promote a laugh, we shall never, we trust, be found willing to do so at the expense, either of good taste or of right feeling.

NATURE'S WITCHCRAFT.

ONE of the most distinguished cultivators of science in Paris, in the middle part of the eighteenth century, was the Abbé Nollet. He was the first to give to his countrymen a popular account of the brilliant discoveries of Newton on Light; and he was associated with Dufay in researches in Electricity, then occupying the attention of all Europe. His extensive acquirements in natural knowledge, his simple eloquence, and

benevolent disposition, gained him general love and esteem.

One day, at the beginning of July, 1736, he was seated in his study, preparing a lecture, when a country gentleman, a landowner of Andelis, a village on the Seine, was announced, requesting permission to ask the favour of the abbé on a point of importance. He was accompanied by several domestics, among whom was one whose pale and anxious face displayed the torments of his mind. The gentleman briefly stated that, being in

Paris on business, he was surprised that morning by a visit from his gardener, with the report that his garden was bewitched, and that, if means were not taken to arrest the evil, his tenants feared the whole estate might be similarly cursed.

"What leads you to suppose that your garden is bewitched?" asked the abbé.

"My gardener here," said the proprietor, "has brought me sundry rolls of leaves, which he says have been concealed here and there under the surface of the ground. I took them to my physician, who, though a very skilful man in his profession, was unable to explain the matter; but recommended me to apply to you as more skilled in such things than himself."

"Let us see these rolls of leaves," said the abbé.

Whereupon the gardener produced a small box, which he opened, and turned out upon the table some half-dozen rolls of leaves, curiously twisted into cylinders, two or three inches long. The abbé looked at them attentively, and inquired when they were found.

"The night before last, your reverence," said the gardener.

"How did you happen to find them?" asked the abbé.

"Why, your reverence, I was cleaning up the garden, and, thinking the walks did not look so tidy as they ought to do, I determined to put down a little new gravel. While walking along them, and looking down, my attention was caught by a number of holes. Stooping down to see the cause, I saw something green, like a leaf, sticking out. The gravel about it was very loose, and on removing some of the pebbles I saw one of these rolls. I had not to search far before I found a good many more."

"And you think these rolls are the work of a witch?" asked the abbé.

"Of a witch or a sorcerer," said the gardener, "and the abbé of our village thinks so too, and recommends holy water, and I don't know what."

A slight blush and a smile passed over the Abbé Nollet's face at the latter remark. Perhaps he thought the Abbé of Andelis would not be a worse curé if he knew something of natural history. "And why do you think these rolls of leaves the work of a witch, or a sorcerer?" he asked.

"Oh, because I don't believe a man could make such things; and if he could, why should he bury them in master's garden, if it were not by way of a charm? The whole village is full of alarm about it, and something terrible will happen if your reverence cannot help us."

"Have you opened any of these rolls?" asked the abbé.

"God forbid!" exclaimed the terrified gardener, as if the very mention of the thing was as dangerous as the thing itself.

"Well," said the abbé, "I strongly suspect these rolls are the work of neither witches nor sorcerers, but simply of insects, and are, in fact, nests for their young. I have in my possession some rolls not unlike these, which I know to be the work of insects. I will show them to you." The abbé then opened a cabinet, and pulled out a sliding shelf, on which various insects, their nests and eggs, were arranged; and among them was a roll similar in construction, but not of the same size, as those which had excited the terror of our honest gardener.

"This," said the abbé, "is an insect's nest; now let us open one of these which have caused you so much alarm." Whereupon he pulled one apart, and a large white grub fell out before the astonished eyes of his company.

The gardener's face, which before had expressed terror and dismay, now suddenly changed to delight and surprise. He rubbed his hands, laughed, and appeared like a man who had just escaped from some heavy calamity. His master exchanged a smile with the abbé, and the gardener was beginning to express his gratitude, when the abbé told him he would do him

a great service, if, on his return to Andelis, he would collect as many of these nests as he could find, and pack them carefully in a box, and send them to his friend M. Réaumur, at Bercy, by the mail. This the gardener promised to do, and the party took leave of the good abbé, well pleased with the result of their visit.

At an early hour the next morning, the Abbé Nollet proceeded to Bercy, in the neighbourhood of Paris, to the house of his friend and benefactor, M. Réaumur, the celebrated naturalist, who was then engaged in those studies on the habits and economy of insects, which have secured to him the reputation, which still attaches to his name, of being the best observer of insects that ever lived.

"You remember," said the abbé, "our conversation respecting some curious nests formed by insects out of leaves, a single specimen of which was sent me from Martinique."

"Perfectly," said Réaumur, "and I have been anxiously looking for similar nests in our own country. My rose-trees are visited every year by some insect which cuts out circular and oval pieces from the leaves; but I have never been able to find how they are used, although I have diligently dug up the ground all about the trees, and watched for hours, both by night as well as by day."

"A very odd adventure happened to me yesterday, which I think will help you out of your difficulty," said the abbé; who then related the adventure of the gardener, and ended by placing a number of the rolls before the delighted naturalist.

"Thanks, my kind friend," he said, and proceeded at once to examine his treasure. It consisted of a roll of leaf, or rather of several large oval pieces of leaf of the elm tree, perfectly dry and brittle; on removing the first two or three pieces, which appeared to form an outer case or envelope, about half a dozen little cups were seen fitting into each other like so many thimbles, the smaller end of one passing into the larger open end of the other, and forming altogether a sort of cylinder. On pulling this apart, a large worm was discovered lodged in a silken cocoon.

"Why, this is the nymph of a bee!" said Réaumur, "and I strongly suspect that this is the nest of a solitary bee hitherto unknown in this country. You have, indeed, brought me a treasure. Yes! here is a grub not so far advanced: it has not consumed all its bee-bread."

"My honest gardener has engaged to send you some more of these nests," said the abbé; who did not prolong his visit, since he saw how eager his friend was to study the specimens without interruption.

It is scarcely necessary to inform the reader that insects provide for the continuance of their species by depositing their eggs in some safe place, with food at hand for the sustenance of the young grubs as soon as they are hatched. In many cases, the parent insect constructs a separate cell for each individual grub, filling it with food, depositing a single egg in the midst of the food, and then carefully sealing up the cell. In due time,—in some species not before the following spring,—the grub is hatched and begins to consume the food provided by its careful mother; it grows rapidly, and fills up its narrow cell in proportion as its food disappears. When nothing more is left to eat, the grub prepares for its metamorphosis; it spins a silken shroud or cocoon,

(1) His *Mémoires pour servir à l'Histoire des Insectes* extend to six thick quarto volumes, illustrated by numerous plates. They were published between 1734 and 1742, and contain the result of numerous observations made principally in his own garden, where he kept insects of all kinds, for the purpose of studying their habits, metamorphoses, &c. His style is somewhat diffuse, but for sagacity of observation, ingenuity of means, and cautious deduction, they are perfect models for the naturalist, and possess all the charms of a romance for the general reader.

(2) Bee-bread is a mixture of honey and the pollen of flowers, with which bees feed their young.

in which it entirely conceals itself, remaining perfectly motionless and without food often during the whole winter. It is now called a *chrysalis*, and is the transition state between a caterpillar with perhaps sixteen legs, powerful jaws, and a voracious appetite, and a winged insect with six legs and a tube or proboscis for sipping the nectar of flowers, or other liquid or juicy food. This is the *imago* or *perfect insect*, which passes a short but active life, employed chiefly in providing for another generation, which she is destined never to behold; for as soon as her nest is complete, and all her eggs deposited, she falls a victim to the first cold of autumn. Such is the general outline of insect existence; there are many variations, it is true, but these need not occupy our attention here.

As soon as M. Réaumur had received the promised supply of leaf nests from Andelis, he examined them very minutely. Each roll contained six or seven little cups of equal size, all concealed under a common envelope of leaves. These cups, as already noticed, fitted into each other, end to end, forming cells, each of which was destined to shelter a single worm from the time of its birth until it had attained the perfect insect form, and containing also the proper supply of liquid honey, or bee-bread, for its nourishment. All this was done with morsels of leaf skilfully arranged without paste or glue, but simply by lapping over each other in a curved form.

The pieces which compose each cell are of nearly the same shape. When cut from the leaf each piece is of course flat, but the bee knows how to bend it to her purpose, and she even folds down a portion of each piece so as to form a base to the cell. Three similar and equal pieces of a somewhat oval form are more than sufficient to form a cell three lines in diameter and about six lines long. Strength is given to the cell by making the pieces which compose it lap over each other, and they are retained in their places by the spring which they acquire in drying. A cell, however, of three pieces is not sufficiently strong to hold the grub securely, and prevent the escape of its liquid food; the careful mother, therefore, folds three more pieces round the cell, and adjusts them in the same manner, and sometimes three or even six more; so that it is not uncommon to find a cell composed of twelve pieces of leaf, all of the same size, or nearly so, skilfully and artistically folded into the form of a hollow cup, capable of holding liquid honey.

Nor is this all. The little pot of honey being placed horizontally, a cover must be provided to prevent the liquid from flowing out. As soon, therefore, as the bee has filled the cell with bee-bread, within about half a line of the top, and has deposited an egg, she cuts out a circular piece of leaf and fits it accurately into the open mouth of the cell. If one does not seem sufficient, she applies another, or even a third of these circular plates, which are kept in their places by the slightly conical form of the cell. The rim of the cell projects above these covers, forming a slight hollow, into which the bee carefully inserts the base of a new cell which is finished as before; and in this way she completes a pile of six or seven cells, forming a tolerably equal cylinder. Lastly, she covers up these cells with an envelope formed of larger pieces of leaf than those previously used, and thus the nest is complete.

M. Réaumur found the bee-bread in the cells to be of a reddish colour, of a sweet yet acid taste, and as fluid as honey.

Quand on sait ce que l'on doit chercher à voir, et où on le peut voir, on a une grande avance pour y parvenir, thought M. Réaumur on entering his garden, after having carefully examined the nests of the leaf-cutter bee. He examined his rose-trees, and found that portions had been cut out of the leaves exactly corresponding to the sections which composed the nests. He therefore determined to watch during several hours at different parts of the day, in hopes of seeing the insect

at work. He had not long to wait, for, about noon on the second day of his watch, he observed a bee alight on a shrub near the rose-bush to which he chiefly directed his attention, and, apparently finding every thing quiet, the insect came over to the rose-bush, placed herself beneath a leaf, seized with her two mandibles the edge nearest to her, and cut it as easily as with a pair of scissors, advancing first towards the principal nervure of the leaf, and then sweeping round again to its edge, soon detached a piece, with which she flew away. All this was done with as much rapidity as one could cut out a similar piece from a sheet of paper with a pair of good scissors.

M. Réaumur did not see this operation repeated more than two or three times during this season; but, in the following spring, no sooner were his rose-trees in leaf, than he cast an eye upon them every time he went into his garden, and, as soon as any of the leaves had been cut, he began to watch them: this was about the end of May, and he soon had the satisfaction of frequently witnessing the little artisans at work in collecting sections of leaves for their nests. During this season he made an immense number of observations, from which we select the following general remarks:—

When a bee arrives at a rose-bush, it generally hovers over it for some seconds as if to select a leaf. In the very act of alighting she seizes it between her mandibles, and begins to cut, not ceasing until the whole piece is detached. As the piece is cut, the bee bends it between her legs, and, when in the act of separating it from the leaf, she vibrates her wings; then, giving the final cut, she falls through a few inches, recovers herself, and flies merrily away. The facility and precision with which she cuts the different pieces, the oval, the semi-oval, and the circular, varying their size according to circumstances, are truly wonderful; without any guide but the instinct with which the Almighty has furnished her, she cuts out geometric figures in a position which one would think most disadvantageous to correct workmanship. Without rule or measure, and even without seeing the line along which she cuts, she is able to tell at a distance from her nest the exact size of the little circular lids to her honey pots, and also to adjust the varying dimensions of the oval pieces for the cells, and for their common envelope.

But, before the little insect begins to form her nest, she must excavate a tunnel in the earth for its reception. This is a work of great labour, in which she is entirely unassisted (the male taking no part in the concerns of the household): she has to dig and to remove much loose earth before a nicely rounded cylinder is completed, proper to mould the leaves to the necessary degree of curvature. This being done, M. Réaumur supposed her proceedings to go on in the following order: she first lines the tunnel with leaves, which, in fact, form the outer case or envelope of the pile of cells already noticed. Entering the tunnel with the piece folded between her legs, she spreads it out, pressing it carefully against the sides; she repeats this process many times, always using large oval pieces, until a very compact lining is formed. She then proceeds to construct the first cell at the bottom of this tube, and, having completed it, goes out to collect the nectar of flowers, covering herself at the same time with pollen; she elaborates the one in her stomach into honey, and discharging it into the cell mixes the other with it, thus forming her bee-bread. She next deposits an egg, and then once more visits the tree to cut out a disk of leaf, with which she stops up the cell. This cell being completed, and not before, a second is begun and finished in like manner, then a third, and so on until the whole is finished.

Although a great number of bees flew away every day with their segments of leaves, M. Réaumur had not as yet succeeded in tracing the locality of any one nest. Were he able to follow a bee to her home he would not be able, it is true, to watch her proceedings in her dark

abode; yet, by examining the nest when about half finished, some new circumstances might be developed tending to confirm the view taken of the course of the insect's proceedings in constructing her nest.

M. Réaumur was one day at Charenton, watching, with the patience of a naturalist, a bee excavating a tunnel for her nest, when, happening to raise his eyes to the surface of a terrace near him, he saw something green disappear in a crack between two badly joined stones. On cautiously approaching the spot he saw fly out therefrom a bee of a larger size than the rose-leaf cutters. She flew to a young chestnut-tree ten or twelve feet off, and cut out a large oval piece, with which she returned. She was soon out again for another piece, and in less than half an hour had made more than twelve excursions, returning laden each time.

As none of the pieces which the bees had cut were circular, M. Réaumur judged that the nest was only just begun, and that no cell was yet finished. He therefore determined to examine the work, to see if an outer case or envelope was really made first, as he supposed. The stones (below one of which the nest was situated) were covered with a grassy turf some inches thick, which being removed, he gently disengaged one of the stones, choosing for the purpose the moment when the bee had quitted the nest, after having remarked that her journeys occupied more and more time. As soon as the stone was removed, the pieces of leaf were soon rolled up into a sort of tube which immediately sprung open when relieved from pressure, because, not having had time to dry, they still retained their natural elasticity. It was, however, perfectly evident, that nothing but the outer case or envelope of the nest was as yet prepared. M. Réaumur put everything in order as well as he could, removed some of the loose earth which had fallen among the leaf cuttings, and carefully replaced the stone. He had not time to replace the turf when the bee arrived: she had no sooner entered her nest than she darted out, doubtless in alarm and amazement at the disorder and confusion in which she found her household. Soon, however, she took courage, and returned; and began to repair the damage, removing the loose earth by pushing it out with her hind legs. M. Réaumur watched her till eight o'clock in the evening, when he was obliged to return to Paris.

At the end of two days he returned to Charenton expressly to see how the little architect was getting on with her nest. He arrived at about five o'clock in the evening, and saw her enter the chink without carrying any leaf; he therefore thought it probable she was bringing in a supply of bee-bread. After she had gone out and returned two or three times without conveying any leaf, M. Réaumur removed the stone and found the nest now to consist of a tube nearly five inches in length. The leaves did not burst open as on the former occasion, for they had taken in drying a permanent bend. On introducing a straw at the open end, it penetrated only to the third of its length, the remaining two thirds being evidently occupied with cells. The stone was again carefully readjusted; but the bee, on returning, was evidently aware that all was not quite right, for she flew out in evident alarm; gradually, however, she took courage, and returned to her nest, which in due time was filled with the usual number of cells.

Such is the history of the leaf-cutter bee, for the knowledge of which we are indebted, first, to the simplicity of the gardener of Andelis, next to the enlightened and benevolent Abbé Nollet, and lastly, to the genius and skill of M. Réaumur; and it is highly creditable to this naturalist, to be able to state, that he made this history so complete, that little or nothing has been added to it. Mr. Newport has recorded a curious fact of one of these bees, which, being about to construct her nest in a brick wall, and finding the hole uneven, first carefully lined it with cotton, thus proving that the insect can vary its proceedings according to

circumstances. It may also be stated that the grub is quite white; that its cocoon consists of a thick solid silk attached to the sides of the cell. The exterior of the cocoon is of a coffee-brown colour, but the interior is a fine whitish silk, smooth and lustrous, like satin. So that, should the leaves become damp and decay, the cocoons afford a warm and dry abode, in which the insect, in one of its states of worm, nymph, or perfect fly, passes the whole of the winter.

C. T.

SOME PASSAGES FROM THE JOURNAL OF A WILTSHIRE CURATE.

[GOLDSMITH'S Vicar of Wakefield was first printed in London in the year 1772. This circumstance, but little interesting to the generality of his readers, is merely mentioned, because it is possible that celebrated author took the first idea of his work from the British Magazine of 1766, which contains the Journal, or, more properly speaking, some Extracts from the Journal of a poor Wiltshire Curate. The editor of the British Magazine assures the reader of the undoubted authenticity of the Extracts, which are not indebted for any of their beauty to poetical additions or embellishments.]

It is, however, difficult to establish this authenticity upon any other grounds than inward conviction; and the kind reader is therefore requested to peruse these extracts, in all faith and confidence; perhaps he may be sufficiently pleased with them to regret that they are but extracts.]

December 15, 1764.—This day I received from Dr. Snarl, my rector, the sum of ten pounds sterling, being the amount of my half year's salary; but even this hardly-earned pittance was not obtained without undergoing much mortification. After waiting for three-quarters of an hour, I was at last shown into the rector's study. He was sitting in a large arm-chair at his writing table; my money was ready counted out beside him. He replied to my salute by a majestic nod, just removing for an instant the black silk cap which covered his head. Certainly, there is a great deal of dignity about him; I always feel somehow as if I was afraid of him. I do not think I should feel more awe in the presence of the king himself. The rector pointed to the money; and my heart beat powerfully when I attempted to give utterance to a request for a slight increase to my miserable salary. Although this request had long been prepared, and I had almost learned by rote the words in which I intended it should be proffered, yet my unconquerable *mauvaise honte* (which gives me the feelings of a criminal, even when doing the most innocent things) quite overcame me. I stammered, I trembled; thrice I began in vain; voice and memory both deserted me: large drops of perspiration stood upon my forehead.

"What is it you wish for?" said the rector, in a most condescending manner.

"What I wish is . . . every thing is so dear . . . with my small income, in these bad times, I can scarcely manage to live."

"Small income, Sir!—What are you talking about? Why, I could find another curate for fifteen pounds a-year, any day I pleased!"

"For fifteen pounds!—Well, if he has no family he might possibly manage to live upon it; but . . ."

"I imagine your family is not increased, Sir? You have but two daughters?"

"No, Sir, but they are growing up. Jane, the eldest, is not eighteen, and her sister Polly is twelve years old."

"So much the better. Can't the girls work for themselves?"

I was going to answer, but he interrupted me, rose from his seat, walked towards the window, and, tapping the glass as he spoke, said, "Well, I have no more time to waste. Consider whether you will retain the curacy with a salary of fifteen pounds a year, and let me know. If not, I wish you a better curacy by New-year's Day." He bowed civilly, and raised again his cap.

I gathered up my money, and took my leave. I was completely thunderstruck. Never before had he received me so coldly, or dismissed me so hastily. Doubtless, he must have heard something to my disadvantage. He never even offered me any luncheon, as he had always done hitherto, and I had reckoned upon it, for I left Cricklade early without breakfasting, and now felt faint and tired; however, I bought some bread in the town; and that was sufficient till I got home again. How subdued and disappointed I felt, as I retraced my steps! I wept like a child!—the bread I was eating was moistened with my tears! . . . At last, I roused myself: "For shame!" I exclaimed; "shame upon this weakness! Is this your trust in God? What more could you do had you lost the curacy itself? It is but a reduction of five pounds! though that is one-fourth of your little income, which must support three people; and though it is but a diminution of a few pence daily, still it will deprive us of some of our little comforts! And what then?—He who clothes the lilies of the field, He who feeds the young ravens, will not desert us!"

December 16.—"Truly, my Jenny is an angel! Her mind is still more lovely than her person. I am quite ashamed to see her so much better, so much more truly pious than myself.

I had not courage yesterday to tell the children of our misfortune. When at last I mentioned it to them, Jane became very serious; then smiling sweetly, "Do not be uneasy, dearest father," said she.

"Not uneasy!"

"No, indeed, you must not."

"My poor child, how can we ever avoid debt and want? I know not which way to turn. We wait so many things—and fifteen pounds will scarcely give us bread!"

Instead of answering, Jane put one arm softly round my neck, and, pointing with the other to Heaven, said, "There, father—there we shall find help!"

My little Polly seated herself upon my knees, and, stroking my face, said, "Do let me tell you a dream I had last night. I thought it was New-year's Day, and that the king, mounted on horseback, with all his court, came to our door. There was a piece of work! What a noise of drums and trumpets! What a clatter and confusion! Then we all set to work to roast and bake . . . However, the king had brought his own food in gold and silver dishes, and, when it was served, what should they bring in upon a crimson velvet cushion, but a golden mitre for you, just such a one as is on the bishop's head, in the pictures in the old Bible. You looked very well in it, though I was ready to die with laughter when you put it on. Just then Jenny woke me, which made me very angry. There must be some meaning in such a dream, particularly when it only wants a fortnight to the new year."

"Pooh! nonsense, child!" said I. "Dreams are all folly!"

"But," she answered, "dreams come from God."

I cannot help thinking so too, sometimes; so I have noted this one down, to see if it was really sent to console us. It is very possible we may receive some New-year's gift, which may be welcome to us all!

I have passed this whole day in calculating, though it is an employment I detest. All money matters puzzle my head, and leave my heart barren and empty, yet very heavy.

December 17.—God be praised! All my debts are paid, except one. I have paid away seven pounds, eleven

shillings; so that I have only two pounds, nine shillings, remaining, and with this I must keep house for half a year! God help me! The beautiful black suit, which tempted me so much in Outby the tailor's window, must now be given up, though I am sadly in want of it. To be sure, it was not dear, but Jenny must have a new dress. I cannot bear to see the poor girl going about in a cotton gown this cold weather. Polly must be satisfied with the merinos her sister wore last year, which she has turned and arranged for her so nicely.

I am sorry to say I must also give up my share in the weekly paper which I have been in the habit of taking with Westburn, the bookseller. I regret this very much; for without it, in this secluded place, one never hears what is going on in the world. They say that at the last Newmarket Races the Duke of Cumberland won five thousand pounds from the Duke of Grafton. How curious it is, that we should thus, every day, see the words of Holy Writ so literally fulfilled, "To him that hath shall be given, and from him that hath not shall be taken even that which he hath!" Even I must lose five pounds from my poor little income!

But shame upon me, here I am again complaining! and why? Because I must give up the luxury of a newspaper. Shame upon me! Surely I shall know soon enough, whether Paoli can maintain the independence of Corsica. The French have sent assistance to the Genoese, but Paoli has at least twenty thousand veteran troops. However, it does not matter much to me.

December 18.—How happy we are all to-day! Jane has bought an excellent second-hand winter dress from a pedlar, wonderfully cheap, and there the two girls sit, working at it, as merry as possible. Jenny understands bargaining far better than I do; indeed, I almost think her sweet and winning manner makes people give her everything she wants on her own terms. How they are both laughing as they work! Jenny means to appear in it for the first time on New-year's Day; and Polly is prophesying what wonderful conquests she will make. No queen was ever so pleased with her diamonds, as these two girls with this simple dress: but, after such an expense, Jenny says we must be very economical.

What a worthy man is Westburn, the bookseller! I told him yesterday that I must give up the newspaper, because I had lost part of my income, and was not even sure of retaining the curacy itself. He shook me kindly by the hand, and said, "But I will continue to take it in, and you, my revered friend, will do me the favour of reading it as before." One should never be tempted to despair; there are many more good men in the world than one thinks; and full as many may be met with among the poor, as among the rich.

Same Day. Evening.—The baker is a hard-hearted man after all! The last time Polly went for bread, she found fault with it for being under weight, and badly baked; this offended him so bitterly, that he called her all manner of names, and ended by desiring she would tell me, although I am no longer a sixpence in his debt, that he would not serve me upon credit, and that we might get our bread elsewhere.

Poor Polly! We had enough to do to console her! I cannot make out how the inhabitants of Cricklade get all their news. Every one in the village says that Dr. Snarl is going to put another curate in my place. It would be the death of me! The butcher must have heard something of it. But for that, he never would have sent his wife to me, to complain of the hard times, and to tell me that, in future, he could only sell his meat for ready money. The woman was very civil, and repeated many times how greatly she esteemed and respected us. She advised us to try Smith, for the small

(1) It must be remembered that our curate had probably a provision of corn meal, dried vegetables, fruit, and other necessaries stored away for winter use.

quantity of butchers' meat that we require,—said he was better to do in the world, and could perhaps afford to wait for his money. I did not tell her how this extortioner had treated us during a year, when he sold us meat a penny a-pound dearer than to other people, charged us for a much larger quantity than we had, and, when at last we proved it to him, declared roundly, with many oaths, that his money must bring him in good interest, if he had to wait a year for it; and so showed me the door.

I now possess but one pound one shilling and three-pence in cash! What will become of us, if no one will give us the necessaries of life on credit, even for a quarter of a year! And if the rector should turn me out!—I shall be upon the wide world with my two poor children!—and is not God there too?

December 19. Early.—I awoke early this morning, and endeavoured to consider calmly the situation in which I find myself. My thoughts turned to Edward Sitting, my rich cousin, at Cambridge; but *poor* people have no cousins! If the new year were to bring me the mitre which Polly dreamt of, half England would find out they were related to me. After much deliberation, I wrote the following letter to Dr. Snarl; and have despatched it by to-day's post:—

"I write with a heavy heart; for every one says your reverence has determined to remove me; I know not whether there is any foundation for this report, or whether it only arises from my having mentioned to one or two persons the conversation I had with you. I have endeavoured to discharge the sacred office committed to my care with zeal and faithfulness; I have taught and preached the word of God in all its truth and purity: have given occasion for no complaints. My inmost conscience has nothing to reproach me with. I humbly requested a trifling addition to my salary. Your reverence immediately spoke of reducing the small income, which is barely sufficient to furnish me and my family with the absolute necessaries of life!—I appeal to your own feelings of humanity. I laboured with your predecessor during sixteen years, with yourself a year and a half. I am approaching to old age, my hair is already grey. Without friends, without a patron, without a hope of other preferment, or the power of obtaining my bread by any other means; the fate of myself and children hangs upon your word. If you desert us, nothing can save us from beggary and ruin. My daughters are now of an age to occasion me greater expenses, in spite of the strictest economy. The eldest, Jane, has filled the place of a mother to her younger sister, and does everything in the house. We cannot even keep a maid; my daughter cooks, washes, cleans the house, sews, &c. I myself perform the other menial offices of my little household. In one respect, God has most especially shown his mercy towards us. He has blessed us with excellent health, we are never ill. We could not have afforded medicines. My daughters have, in vain, attempted to obtain employment. They were ready to wash, to iron, to do any kind of needle-work; they can scarcely ever get it: for, in a poor village like this, all help one another, no one can afford to pay for assistance. It would be hard enough, if I must still endeavour to exist upon twenty pounds a year, but it would be still worse if I am to find myself reduced to fifteen pounds; but I trust in the goodness of God, and your own humanity; and humbly entreat your reverence speedily to put an end to my present state of anxiety."

When I had finished my letter, and given it to Polly to take to the post, I threw myself on my knees, and prayed for the blessing of God on the step I had just taken; and soon I felt strangely comforted and cheered; for a word addressed to God, has ever the same blessed effect as a word from him. I had entered my chamber bowed to the earth with grief, and now left it cheerful and composed. Jane sat working at the window. She looked as calm, as happy, as peaceful as an angel. Her sweet face beamed with joy and contentment. A faint

sunbeam shone through the little window, and illuminated the whole room. I felt inexpressibly happy. I seated myself at my desk, and wrote my Sermon "*Upon the Joys of Poverty.*" God grant it may infuse into the hearts of others a portion of the consolation I felt while writing it—while reviewing the joys and blessings which still remain to me, and giving vent to the feelings of thankfulness which they inspire! Even if it does good to no one else, it has been of use to myself; should my weak words comfort no other soul, they have soothed my own. But the preacher is like the physician, he knows the power of his remedies, though not always the exact effect they will produce upon his patients.

The same Day. Noon.—This morning I received a note from a stranger, who arrived last night at the inn, and entreated me to come to him for a few minutes upon pressing business. I went immediately, and found a handsome young man of about six-and-twenty. He had a noble countenance, and very prepossessing manners, but I remarked that his coat was old and shabby, and his boots patched in many places. His hat, though originally a much more expensive one than my own, was now much more worn and old. In spite, however, of his shabby dress, I could not help suspecting that the young man was well-born. He certainly had on a shirt of the very finest linen, and as white as snow, but it is possible it may have been a present from some benevolent person. He conducted me into a small private room, and after making a thousand apologies for the trouble he had given me, he confided to me, with some embarrassment, that he was in the greatest possible distress. He knew no one in this village, where he only arrived last night, and had addressed himself to me, the clergyman, as the only person from whom he could have the slightest hope of obtaining assistance. He told me his profession was that of an actor, but he was now without any engagement, and on his way to the town of Manchester. Unfortunately, however, he had got to the end of his money, and had not enough even to pay for his lodging, much less to carry him to the end of his journey. In his despair, he had recourse to me. Twelve shillings were all he asked for: and he promised, if I would advance him this small sum, to pay it me back faithfully and honourably, the moment he obtained an engagement. His name is John Fleetman.

There was no necessity for describing to me so fully his trouble and distress; his countenance expressed it even more vividly than his words; but he must have read something similar in my features, for, on raising his eyes to mine, he started, and said, "Will you not assist me?" I then confided to him the exact state of my own affairs, without any attempt at concealment: I told him, that what he asked of me was the fourth part of all the money I possessed in the world; and that I had great reason to apprehend the approaching loss of my curacy. His manner suddenly became cold and constrained, and he said, "You are relating your misfortunes to one still more miserable: I ask nothing from you; but is there no one else in Cricklade, who, if he does not possess riches, has at least some humanity?"

I felt rather confused and ashamed, and as if I had confessed my miserable position to Mr. Fleetman, in order that I might be hardhearted without blushing for it!—I thought over all my parishioners, but there was not one to whom I could venture to recommend him with a certainty of success. Perhaps I did not know their hearts sufficiently! I then approached him, and, offering him my hand, said, "Sir, you grieve me much. Have a little patience. You now know how poor I myself am, but I will help you if I can. In an hour I will give you an answer."

As I returned home I could not help thinking how extraordinary it was, that the stranger should have addressed himself to me!—an actor to seek help from a clergyman! There really seems to be something in me, which, like a magnet, attracts the unfortunate and the distressed! All who are in want turn to me, who,

unluckily, have so very little to bestow. Even if I dine with a friend, if there is a dog in the room, I am perfectly certain that he will come and rest his head upon my knee, and fix his eyes so beseechingly upon the morsels which I carry to my mouth, that I cannot help giving them to him.

When I got home, I related to the children who the stranger was, and what he wanted. I asked Jenny her opinion; she said, compassionately, "Nay, my dear father, I know well enough what you wish; you have no need of my advice."

"And what is it I wish?"

"You wish to treat the poor actor as you hope God and the rector will treat you."

I own this had not been my feeling; I wish to God it had! I took out the twelve shillings, and gave them to Jenny to carry to the traveller,—I should have felt humbled by his thanks. I can better bear ingratitude; besides, my sermon was very far from being finished.

The same Evening.—No doubt, the comedian is an honest man. When Jenny returned from the inn, she had plenty to tell me about him, and of the landlady too; for the woman had easily discovered that her guest had an empty purse, and my daughter could not conceal from her that I had furnished him with money, with which to continue his journey. This drew down upon her a long discourse on my improvidence, on the wickedness of encouraging tramps, of giving one's children's bread to strangers, that charity begins at home, &c. &c.

I had just settled myself to my sermon again, when Fleetwood entered the room. He said he found it impossible to leave Cricklade without thanking the benefactor whose generosity had extricated him from the most distressing situation. Jenny was just laying the table for dinner. We had bacon, and plenty of potatoes. I invited the stranger to share our meal. He readily accepted. Indeed, it must have been welcome, for I suspect he had but a poor breakfast. I sent Polly to draw some beer; and it was a good while since we had enjoyed such a comfortable meal. Mr. Fleetman appeared pleased with his reception; he soon lost the look of suffering and distress which he had at first, but preserved that modest, timid demeanour, which I have often seen in those who are a prey to the persecutions of fortune. He thought us very happy, and we assured him that he was right. He imagined I must be richer and better off than I chose to appear; but there he was in the wrong. No doubt the good man was deceived by the order and neatness of our rooms, where everything was bright and clean; our furniture, though plain, was in perfect order, the table linen white as snow, and spoons and forks as bright as hands could make them. One is accustomed to find dirt and disorder in the abodes of poverty, for the poor never understand true economy. But I always endeavoured to impress upon my late wife, and upon my daughters, that order and cleanliness are ever the very best economy; and Jane understands this thoroughly: she almost surpasses her poor mother, and brings up her sister admirably in the same way; I do not think the smallest speck would escape her quick eyes.

We soon became quite intimate with our visitor; but he spoke less of his own affairs, than of our precarious situation. Poor young man! there appears to be something weighing heavy upon his heart! God grant it may not be upon his conscience! I remarked that he sometimes suddenly ceased speaking, and a dark cloud came over him, which, with a strong effort, he threw off, and strove to be gay again. God help him! When he left us after dinner, I thought it my duty to give him a great deal of good advice; for I know that stage-players are often light and thoughtless people. However, he gave me his sacred promise, that as soon as ever he was in possession of the necessary sum, he would faithfully return what I had lent him. He must have meant what he said, for his words and manner were

noble and impressive, and he asked more than once, for how long the money which remained would suffice to procure us the necessaries of life. His last words to me were, "It is quite impossible that you should ever be unhappy; you have heaven in your heart, and" (pointing to my daughters) "two of God's angels at your side!"

(To be continued.)

ON THE SUPERIORITY OF VOCAL OVER INSTRUMENTAL MUSIC.

It would appear at a first glance, that there could be no question as to the superiority of instrumental over vocal music; the varied, complex harmony belonging to the one, would apparently be far beyond a power which has only simple melody at its command—at least comparatively speaking it can hardly be said to possess more. Why is it, then, that the most spirit-stirring instrumental music, however it may dazzle and delight, can neither at the moment make so deep an impression, nor yet linger with us through life, as the tones of some simple song from the lips of one who knew well how to feel, and to express, its beauty? That this is the case with persons in general will be readily conceded, and but one reason can be given; good singing really touches the heart, while instrumental music, with all its wonderfully-blended harmonies, capable indeed of dazzling, of delighting, possesses not the power, at least only in a very inferior degree, of making us feel; and it may be, too, there is something in the *mechanism* of an instrument which renders us less susceptible of music proceeding in any way from such a source.

There is also a most important cause of its want of permanent impression. A performer may be entire master of music as a science, and yet not possess one particle of feeling—he may be perfection in the knowledge and execution of his art, and yet be a mere automaton. Now with good singing this is impossible; feeling is its very essence, its being; it has no existence apart; and well may mechanism and science shrink before a power which fills the soul of the poet, the painter, the sculptor, which alone can create the beautiful in all things. None would assert that all instrumental performers are deficient in the more subtle and refined portion of their art; yet even Thalberg, with all his depth of feeling, can never speak as he would have done, from the soul to the soul, had nature given him the power of utterance without the mechanical medium of keys and wires.

Some persons rest the claim of superiority on an orchestra. We will speak of one which is unrivalled, the orchestra of the Italian Opera; and yet the audience, unquestionably persons of the utmost refinement, surrounded by perfection in every art, familiarised with the great masters of music in all their excellence, and therefore likely to possess the power of feeling and appreciating, yet these persons listen with apathy, or more properly, can hardly be said to listen at all, until the first low notes of the singer change in a moment the character of the whole scene. Shall we speak of one to whom, in all human probability, we shall listen no more, of perhaps the most exquisite singer England ever will hear,—of Rubini. When that most perfect voice fell on the ear, so unbroken was the stillness, that the vast house seemed filled only by an assemblage of statues, save only for the expression which soul-subduing influence called up into every face capable of expression at all. Let any one listen to Phillips's singing from the Messiah—it is impossible for any combination of sound to be more thrilling, more majestic, more perfect, than that single voice. When he utters the words, "And darkness shall cover the earth, and gross darkness the people," who does not tremble with a dim

elling of that desolation where the light of God shone not, even as "darkness which might be felt." We will imagine, as the last tones of the singer die away, the organ pouring forth the glorious magnificence of its music—magnificent it indeed is, and we shall acknowledge while we listen that it is indeed the triumph of art, but we shall feel that the first sound, the voice of the singer, was the triumph of nature. It may be remarked, that part of the effect produced by the Messiah is from the sublimity of the words. This will readily be conceded; but, as poetry and vocal music are so legitimately linked, are so entirely one, it is of their united charm we speak, in dwelling on the beauty of vocal music in its highest perfection. But we need not look so high as the inspired writings, or the noble melodies of Handel, for beautiful and lasting effects; none ever heard Moore's Irish melody,

"Farewell, but whenever you welcome the hour,"

sung under the circumstances for which it was written,—sung at the parting hour by a dearly loved friend who could feel and express its exquisite spirit, without remembering it through life—without feeling, whenever the song might be heard again, though at the interval of years, that one evening come back, vividly as it had been but yesterday,

—"the day, the hour,
All things pertaining to that place and hour,"
remembered faces—familiar voices—the singer, the circle of "happy friends," it may be, dispersed never to meet on earth again; all, at the moment, would return with a distinctness, a reality, which we would defy all the instrumental music in the world to produce. The power to soothe and charm the present hour, to embalm the memory of the brightest past away, is surely not a light one, and may well claim pre-eminence over all the splendid perishing gratification which instrumental music can give. We willingly concede its scientific superiority, its more brilliant qualifications, but we claim for the union of melody with poetry, something more refined, more exalted, an abiding influence over the inmost soul which cannot pass away.

RAMBLES IN BELGIUM.

No. I.—OSTEND.

I HAD for a long time felt a great desire to see the Low Countries; my wish was gratified. After a voyage (for that it literally was) of two days, the minutiae of which I will not detail, I landed at Ostend. There is scarcely any sensation more pregnant with novelty, and a sort of confusion of ideas, than that which awaits a traveller from the shores of Old England, when first he sets foot on a foreign land. Something new, something strange is about and around him everywhere. New customs, new costumes, new ways, new habits, solicit his attention on all sides; and though the intercourse of all the continental nations with the inhabitants of Albion's isle has become more and more frequent, as civilisation, with all its concomitant blessings of steamboats, railroads, &c. has advanced, still novelty and a difference are visible in every aspect of the *terra nova*.

That such were my own feelings I must frankly confess, when, after a night's repose in the *Hôtel de la Cour Impériale*, I sallied forth to see Ostend.

First, the whiteness of the houses, so different to the exterior of our own habitations in smoky London: this had for me an extraordinary effect, inasmuch as I could not refrain from fancying that they had all been recently painted or cleaned. This very agreeable appearance arises from the fact of the prevalence of wood as an article of fuel.

Sensation the second, was produced by the garments of the populace, so picturesque and distinct. The many priests I encountered, with their flowing cassocks and tri-cornered hats, added very considerably to the grouping of the scene: their name in Belgium is legion: in almost every street, in every nook or sequestered spot, on the beach, in the outskirts of the town, there they were. I must say they did not give me the notion of rigid abstinence from rich men's feasts, for all that I saw wore of a very comely port.

Ostend, as well as I could ascertain, is not a very remarkable place: there are few remains of antiquity in it. It stands on a low flat shore, the sands of which, and the fortifications, especially the rampart, present a charming promenade for the many visitors who flock here, during the season, to avail themselves of the opportunities the place affords for bathing. Oysters are sent to all parts of the kingdom, and the Ostend oysters are considered of great excellence. There is a great deal of fishing carried on. One of their contrivances in the piscatory art afforded me much entertainment: a round net is fastened by loops to the end of a long pole, and repeatedly ducked in and out of the water: many of these nets were, however, left all night attached to boats; I had no means of knowing with what success.

I had an introduction to a widow lady, who resided in the *Rue de la Chapelle*, but it happened unfortunately that she had the day previous gone on a visit to some friends at Bruges, so that I did not see her. The grisette, a lively young Frenchwoman, gave me permission to see Madame's pictures: the gem of the collection was a small Rubens, equal to anything I ever saw by that master. I could not ascertain whether there was any particular lion visible in or about the neighbourhood.

The church has no especial feature to invite the attention of the tourist eager to behold others well known to fame. Far out at sea, you may descry the steeple, a very welcome sight to all who love not, and are not loved by, the rolling deep.

I was much amused with the obstinate adherence of an old epicier, to the faith of a *fact* somewhat dubitable. I certainly had heard that the celebrated "huitres d'Ostende" were really and truly an English importation, sent here to be improved, or rather educated, to suit the Belgian palate: indeed, I had seen the oyster parks a few hours previous to my conference with the Fleming. When I expressed my belief that the fish were not Ostenders, but English born, he had for all reply, "Monsieur, mais Monsieur, vous êtes trompé; c'est bien drôle, mais pardonnez, vous êtes trompé." The same worthy, on hearing me exclaim that I had not seen a tree in or near his patriotically loved dwelling-place, offered, with no small pomposity of manner and proudness of voice, to guide my ignorant person to a spot where I should behold a tree of large dimensions. A short walk brought us close to this famous specimen of the forest tribe. Shades of Pansanger, noble avenue of Hatfield, how you rose to my mind's eye, in your quiet, stately grandeur, with all your majesty of limbs rich with the hoar of ages! Imagine a common sycamore, in one of those out-of-the-way churchyards in the great metropolis, and you have before you an exaggerated specimen of the leafy glory of Ostend.

After a walk on the sands, and round the ramparts, I was not sorry to partake of a most comfortable and

well-served dinner. Nothing could exceed the spotless purity of the table-cloth, or the cleanly and neatly-arranged style of the whole apartment. It will not do to detain the reader over further particulars of Ostend, for within a few miles lies a town far more interesting, and one to which I will direct his attention speedily: but let us for the present pause.

THE WANDERER'S RECEPTION.

CHAPTER I.

THE sky was dark and stormy, the clouds sent forth torrents of rain, and all nature threatened a dark and dreary night, when an old man, tottering along the road, turned aside to rest against the stem of an ancient oak. His dress bespoke great poverty, his staff could scarcely support his weak frame, but no shrinking fear could be traced in his countenance; his white hair, blown by the boisterous winds off his wrinkled forehead, showed a restless, anxious eye; and, while his bodily infirmities demanded repose, he turned eagerly towards the road, his heart apparently longing to resume the journey. The large drops of rain could not cool his brow, and the lightning that played with destructive beauty around the branches above him, served to show more clearly his haggard and worn features. Could we have seen his heart, we should have discovered that, although his journey through life had been sad, yet the hope of future joys, and faith in the love and support of his Maker, had ever proved, as it still did, his strength and consolation.

The old man's eyes were closed, as if to shut out the distance between him and his destination, when a low, gentle voice recalled his attention to the present moment, and, looking down, he found a little child clasping his hand, in sweet tones trying to comfort him.

Stroking her fair hair, now damp with the falling rain, he inquired why one so young and tender braved the dangers of such a storm.

"I am looking," replied the little one, "for my dear 'Trust.' If you have seen a large black dog pass this way, pray tell me, that I may find him."

"Poor child! you must not wander to seek the animal now. While you speak so kindly of your favourite, have you no considerate parent to be uneasy at your absence?"

"They call me Mary. I never saw my father, but my mother told me he was not lost; and one day, when she was very ill, that she was going to him, that they would both wait for me, but that I must stay amongst the green fields till I was called to them. I never saw her again; and my aunt brought me to her home. I called 'Trust,' and he ran by the cart all the way; I cannot bear to lose him, he loves me better than any one."

"How is it you have lost your pet? and why have you been allowed to come out now to look for him?"

"This morning my uncle took me to school; I had never been there before, but my aunt has so many babies at home that she has no time to teach and love me. I begged very hard that my dog might come with me, but they would not let him, and when I came back he was gone; he would not eat the dinner they offered him, and I am sure he went away to look for me. I must find him; I am very unhappy without him;" and the tears ran down her cheeks as she spoke.

"I should not have thought it possible, this morning," reasoned the old man, "that I could turn aside during to-day's journey; but this little girl requires assistance, and I must place her under some protection."

Turning towards her he raised her drooping head, and desired her to tell him where she lived, that he might take her home.

"Not without 'Trust,' indeed, I cannot go back without him. It did not rain so fast, and there was no thunder, when I ran from home. I am sure if I could call loud enough he would hear me."

The little girl could not be persuaded to return without the missing favourite, and entreated the old man to let her go to a shed in the next field, where he might have taken shelter: it was quite in vain to tell her how unlikely it was that they should find the dog; and, rather than leave his young companion in distress, he moved towards the spot. The child put her little hand into his, and jumped forward as if to reach the hovel in one bound, but, when she found her friend so feeble, her heart reproached her, and, with a few tears at the idea of not seeking her pet, she begged that he would turn towards her aunt's cottage, where he would find rest, and could have his clothes dried; but, seeing he would not listen to her thoughtful proposal, and persisted in his intention to grant her former request, she determined that he should not expose his health on her account, and appearing to consent, and to guide him to the hut, she gently led him round the tree in the opposite direction, and did not discover to him her simple artifice till at the door of the cottage. With warm gratitude did the old man regard her; but, intent on securing him a welcome, Mary hastily let go his hand and pushed open the door, when, to her great joy, Trust sprang upon her with every manifestation of satisfaction at the meeting. Upbraiding him for running away, she drew near to her uncle, earnestly entreating him to take care of the aged traveller. She was soon made quite happy by seeing him seated by the fire, and partaking of their frugal supper.

Mary's long absence had caused some alarm, but she begged for forgiveness, and soon ran off to her bed. Quite exhausted with crying and running about in the damp fields, she directly fell into a sound, quiet sleep. Her aunt, wishing to point out how mistaken she had been in going at such a time to seek the dog, went to her room as soon as she could leave the other children. She felt unwilling to disturb her, and sitting down by the bed-side she watched her slumbers. The lightning still played round the house, but did not agitate the sleeper; her soft dimpled arms were crossed over her, her fair locks fell over her shoulders, and her half-closed lips seemed ready to impart some mystery of sleep: presently she moved uneasily, and with suddenly outstretched hands murmured, "Mother! Mother!" For the first time her companion felt tenderly towards the poor orphan. She had unhesitatingly taken charge of her as her sister's offspring, but, with none of her own, she had not paid any particular attention to Mary, and, seeing the child apparently happy, singing in the fields, and playing with Trust, she had felt contented about her. She was too generous to feel the addition to her family a burden, and without reluctance offered her such advantages as her own children enjoyed. Mary troubled no one, and had become so independent that none of the family thought of guiding her actions or consulting her feelings. Her aunt now felt drawn towards her, and she blamed herself for not having taken greater interest in the child's pursuits and tastes; gently bending over her and kissing her smooth brow, she prayed for strength to be able to take the place of that parent with whom the slumberer, in spirit, seemed now to be united.

CHAPTER II.

On joining her husband and their guest in the lower room, Martha, Mary's aunt, found the old man ready to relate the circumstances of his journey, and, on their expressing sympathy in his apparent troubles, he offered to recount the most important events of his life; to which proposal they willingly acceded.

"I was born in the north of England," he began, "and, in so remote a village as ours, my parents would

have found it difficult to provide instruction for me. They were not able to give me advantages themselves, and I shall never cease to feel grateful that events were ordained in such a manner as to afford me these benefits. Until I was nearly fourteen years of age I helped my father in his workshop; he was a carpenter, but I never much liked this trade, and for some time he spared me part of the day to attend the school, which an excellent clergyman, who had just come to us, had established; but as I became more useful my father required my assistance constantly, and I was obliged to leave my book. This privation made me very unhappy, and I fear discontented, although I had so many blessings around me. Soon after this change in my employment the elder son of our good clergyman was ordained to the holy office in which his father had set him so bright an example; he proposed taking me as his servant. Nothing could have afforded me greater satisfaction, and I soon became sincerely attached to my kind master; he bore all my youthful failings with charitable forbearance, and devoted some time every day to my instruction. As I became older I learned fully to understand his worth, and to appreciate the lessons he taught me: nothing could persuade me to leave him, although he promised to try and procure me a better situation. His charities were too extensive to allow him to give me very high wages, but I felt I was happier in trying to assist him, and could not tell what my temptations might be were I to leave him. When about thirty years of age I married a farmer's daughter; but until my dear master's death I continued to reside with him;—my wife acted as his housekeeper. When we lost his earthly presence we removed to a small farm in a distant part of the country; there we had the satisfaction of seeing our children benefit by the excellent advice I had enjoyed, which I was then enabled to repeat. One by one they left us for homes of their own, until we had only one daughter remaining with us; she was several years younger than the rest, and we looked forward to her cheering presence for some time; but at the early age of seventeen she attached herself to a young man of whom we knew very little. For some time we refused to consent to their union, but our poor girl seemed determined, and, as we could not give any decided objection, with reluctance we suffered him to take her from us; he appeared to have good prospects as a settler in Canada, and they sailed shortly after their marriage. My wife and I were then advanced in life, and after some few years of domestic peace, she was taken from me: I gave up my farm and spent my time amongst my children. I had not received any intelligence of my youngest daughter since her departure, until some months ago, when she wrote to me begging for tidings of her family; she dated her letter 'Southampton,' and desired me to direct my answer to a post-office in that town. She had just arrived at England, and intended coming to us as soon as possible; she never mentioned her husband. I instantly wrote and told her of her mother's death; but fearing that my dear child might want a home, I arranged that she should come to me at a cottage which I took for the purpose in the village where one of my sons resided. She never answered this letter, and, thinking that distress caused the delay, I enclosed her money for the journey. After this all my letters were returned, and months passed away without my knowing where she was until three days ago; I heard from a person whose name was unknown to me, that my daughter was very ill, and wished I would come to her: I had given up the cottage on finding that she was not likely to come to it, but I had spent nearly all that I had in making it comfortable. I was anxious to reserve some small sum for her use, and therefore determined to undertake my journey on foot; for two days I have travelled over tedious roads, in spite of bad weather and fatigue; this has brought me to the condition in which you find me. To-morrow I hope to reach my destination."

"You shall not proceed another mile on foot," interrupted Mary's uncle; "I am a farmer, and can send you on in one of my carts; my eldest boy can drive you, and my wife will find him some commissions to execute in the town which is the nearest to this village, and is not more than a few hours' drive."

The old man gratefully accepted this offer; and turning to Martha expressed a hope that more care might be taken of Mary for the future. He eagerly listened to her short history; asked several questions, and, when he had heard the whole account, he expressed his wish of residing near them, in order that the child might be with him constantly. "I cannot," he added, "say how deeply she interests me. Should my dear daughter be willing, I shall bring her back with me, and should be glad to be near those who would be kind and feel interested in us."

The farmer and his wife were much pleased with the proposal, and at once told him of a small cottage, not many yards from their door, which they knew was then vacant and likely to suit him; it was agreed he should stop and see it on his road the next morning. The night was now far advanced; Martha had made a bed for the old man in the sitting-room, and he gratefully sought the rest he so much needed.

CHAPTER III.

WITH early dawn little Mary awoke, and sprang eagerly to the window; the storm had passed over, and all around glistered in the morning sun; she fancied the birds welcomed her, and joined in her prayer and thanksgiving for the many blessings she enjoyed. While listening to their joyous songs, her little heart blessed the Great Giver of all mercies, and rejoiced that she was gifted with a mind that could understand and feel what their instinct alone made them value.

Impatient to visit "Trust," she was not long dressing, and ran merrily into the yard to unchain him; her joyous laugh soon brought the old man to her side; he gently remonstrated with her for the anxiety which she had caused the previous evening.

"I thought," answered the child thoughtfully, "that only mothers were anxious; my aunt is very good and kind; but you know I am not her own child."

"You have a Father who will guide you and direct you, if you will listen to His voice; He will take you to a home in heaven; but it is His will that you are now here; He allows you to enjoy the protection and affection of those around you; and you must learn to cherish, deserve, and feel grateful for their care."

"You love me; may I not come and live always with you?"

The old man's heart yearned to take the little girl under his own eye; she much resembled what the daughter he now sought had been in infancy.

On observing the old man's eyes so mournfully fixed on her, the little one felt quite frightened, and meekly inquired whether she had been very wrong in asking to live with him.

Not wishing the child to observe his emotion, he answered her by telling her of his intention to return soon, and perhaps stay in the village, when he should be able to see her every day.

"I shall be very glad if you will always be with me, and teach me what is right," exclaimed the child, clapping her hands; but seeing her friend still look grave, she became suddenly silent, and gazed inquiringly at his face.

"I cannot alone make you do what is right, Mary; you must seek such guidance from your Maker. Should He graciously deem me a worthy instrument to instruct you, I shall be thankful for being permitted to show you the path to perfect happiness. Come," he added cheerfully, "you shall now show me the cottage I hope to live in."

"We will call it our home," said the child, "for you know I may come and see you very often." Gaily skip-

ping along the path, but keeping tight hold of his hand, she led the old man to the spot. The dwelling was very small, but clean and neat; the little garden offered pleasant and profitable employment.

Mary gathered some flowers for a wreath for "Trust's" neck, who had kept close to her side, as if fearful of again losing her, and then, insisting on her companion's taking a beautiful little rosebud to remind him of her during his day's journey, followed him back to her uncle's house. Breakfast was ready; and soon after she was obliged to part with her new acquaintance. His blessing brought tears to her eyes; for she remembered the time when she came daily for her mother's kiss; she turned sadly away, but found her aunt by her side, with such a look of kind sympathy, that she, with surprised joy, received her caresses.

The traveller's history had much interested all who heard it; and Martha much desired that he should return and assist her and her husband in the guidance of their children. She was good-hearted, and endeavoured to do what was right herself, and to influence them to do so likewise; but she had not enjoyed the benefit of education, and lamented her own deficiencies too sincerely not to know that she was wanting in much, which she desired that her children should understand.

Mary sat silent in the porch, puzzling to find out what could make her cry so much; for she fully expected her aged friend would return; and she thought her aunt's kindness ought to have made her quite happy.

"Are you going to school to-day, Mary?" inquired little Johnny.

This question roused his cousin; she felt she had much rather stay away. "Trust," who had sat at her feet, with his head and paws resting on her knees, as if to express his wish to share her feelings and cheer her, now jumped up, wagged his tail, and looked wistfully in her face; she thought she would gladly escape to the fields with him, and hastily answered the little boy,—"I shall not go to-day, Johnny; you must go without me."

The astonished look of the inquirer, who had never seen her so irritable before, recalled Mary's sense of duty; and taking the child's hand, she told him to go with her to her aunt, that she might ask her.

Martha guessed what passed in her niece's mind, and tenderly sought to indulge her without allowing her to spend the day in idleness, which would make it appear so much the longer. "You shall take this bundle of work to the Squire's, instead of going to school; I want it carried home, and Mrs. Adams will perhaps be able to give you some more to bring back to me; James will be home in the afternoon, and you can return in time to meet him, and receive any news he may bring of your friend." Nothing could have given Mary greater pleasure than this errand. The kind inhabitants of the Hall were always good to her; took pleasure in instructing her; and encouraged her visits. Mr. Stanmore was very wealthy; but he had so conscientious a belief that riches were entrusted to him to benefit others, and to be a means of extending his duties as a Christian, that a large portion was each year put aside for the relief of his poor tenantry, and more for other charitable purposes. The only being on whom he lavished extravagance was his daughter. Her mother had frequently objected, when she was very young, to her having such large sums at her own disposal; but latterly, when she saw how her daughter had been led to view her wealth, she never checked her father, and thankfully allowed her the full control over what he put into her hands. This only child, so dear to her parents, had been brought up with every care; and her instructors now rejoiced to find that their precepts had taken effect on her heart,—her daily, hourly actions setting forth the principles which she had embraced. With her, Mary was a great favourite, and she would often call for her, on her pony, and take her with her when she visited the poor on her father's estate; they used sometimes to go some distance, and spend hours in the fields and woods; Ellen

Stanmore constantly made Mary ride. The child amused her with her ideas upon everything around them, and her friend took great delight in directing and improving her protégée. Their favourite resting-place was an old ruinous chapel; it was well shaded by ancient trees; and here they spent the hottest days of summer. Ellen brought books and work, and found a ready pupil; such a kind mistress soon became dear to the scholar; and when her aunt gave her the errand to Mrs. Stanmore, she rejoiced that she should have an opportunity of relating her adventures with the old man.

When she came to the housekeeper's room, she found Mrs. Adams very busy; she had also much affection for Mary; and when the ladies were engaged, made her sit with her, and the old woman took great pride in teaching her to work; but on this occasion she appeared too much occupied to attend to her. Mary gave her aunt's message, put down the bundle, and timidly inquired whether she might see the ladies.

"I am not sure that you can go to them to-day, but you can run round to Miss Ellen's sitting-room; she may be alone with her cousin, Miss Francis, who is staying with her; there are several visitors here now, but the young ladies spend some part of the morning in their own sitting-room."

Mary, for an instant, thought she would rather not see her friend than meet a stranger; but she remembered her desire to interest her in the old man's history; and, trying to be courageous, she skipped on to the lawn, and ran to the window, where she had so often found admittance. Peeping in, and knocking gently on the glass, she was disappointed to find only the strange lady there.

"I came to look for Miss Stanmore," she hesitatingly replied to the inquiry of what she wanted.

"My cousin will soon be here; what have you to say to her?"

To relate her tale to any one else seemed impossible; yet, fearing it was rude to refuse, she was much puzzled what to say, when Ellen's entrance relieved her; she warmly welcomed her little favourite, and soon employed her by begging for her assistance in arranging some flowers. The presence of a third person put a restraint on Mary, but she was happy in being useful. Some more flowers were wanted from the garden, and, carrying the scissors, she went with Ellen to pick them.

"I fear, Mary," said the latter, "we shall not have many more rides this summer; my cousin Anna will stay some months with me, and I must consult her wishes."

"But cannot she come with us; I am sure she would like to walk in the woods?"

"She would not, I think, find the attractions in nature that we do, and I believe would prefer a drive in the carriage."

"Then it must be that she has never seen them."

"We will not try to find out what her reasons may be; it is sufficient for us that we give up our own pleasure without a murmur."

Unfortunately, Mary was not inclined to be so contented, and would readily have expressed her dislike of such an obstacle, had she not feared that her companion would be displeased; looking at her peaceful countenance, she felt almost ashamed of her own thoughts, and walked on for some time in silence. At last she recollected that this might be the only opportunity for mentioning her new acquaintance. She looked doubtfully in her friend's face, half fearful that she might not have time to listen.

"I see, Mary, that you have something to talk about this morning; as we cannot indulge in our walks, and conversation at the ruin, you must learn to speak to me here."

"I would gladly do so; but although there are so many beautiful flowers here, and the birds sing around me as sweetly, I feel as if these neat walks and made-up

seats took away all the ease that I have with you in the woods."

"Dear child, you must not feel thus; all the beauties here are as natural, and I am as ready to hear you; such trifles should not influence you. Come, we will rest on this bench, it may not be as soft as our turf seat; however, it is in the shade."

But the child would not sit down, and remained timidly leaning on the arm of the seat, while she gave her account of her new friend.

"You certainly have found a pleasant acquaintance, and I hope he may prove a valuable adviser; but I cannot see why you should have hesitated telling me this before."

"The difficult part is to come: he loves me already; he has no one to take care of him, and I want to live with him; I can do a great deal of house work, and I would not then run about the fields all day; I want to learn all he has to teach me. I am afraid you will think this very bold of me, when he has never given me leave, and he looked so grave when I told him, that I thought you might do the same."

"This is a strange idea; and I can scarcely think you are right in dwelling on such a plan. I fear you are not sufficiently grateful to your aunt. Had you a more contented mind, you would be less restless, and happier where you are."

"But I am certain that the old man would teach me what was right much better than my aunt."

"Have you already learned perfectly all the duties which she teaches you? Is there nothing that she tells you, that you neglect?"

Mary felt that she was very wrong; the beautiful scenes that surrounded her seemed to reproach her; she covered her face with her hands, and now bitterly repented her ill-humour. She owned her errors, and knew where to seek for that forgiveness and direction which no human being could give her. After a few minutes' silence, she ran after Ellen, who had walked on; her smiling face was now as cheerful as ever.

"My heart is quite bright now," she exclaimed, "and I want you to grant me a favour before I go, then I can run home and wait for James."

"You may ask your favour; but I shall be obliged if you will carry the flowers in for me."

Mary had not intended to meet the stranger again, but, remembering how uncharitable her ill-temper had made her towards Anna, she ran in with her basket, and taking the prettiest rose she could find, laid it by her side; and without waiting for an acknowledgment, bounded back to Ellen.

"Now for my request. Will you promise to come and see my old man directly he comes? You know I may sometimes, if my aunt will let me, visit him; and if you were there at the same time, it would be almost as pleasant as the ruin."

"I will try and come, if you will first ask him whether he would like to see me; and if my cousin does not require my company."

"Will she not come with you?" In her heart Mary hoped Anna would not come; but she thought of her former bad feelings about her, and fancied she should thus make some amends, as she could not doubt that she would like the visit.

"We will see, Mary; I cannot say what would be most agreeable to her; but when you let me know that your friend is come, and willing to see me, I shall use every endeavour to come to him."

With this assurance the child was obliged to be satisfied; taking leave of Miss Stanmore, she returned to Mrs. Adams for the fresh supply of work, and was soon running down the road leading to her uncle's cottage.

(To be continued.)

Biographical Sketches of Eminent Painters.

SIR JOSHUA REYNOLDS.

HAVING traced the history of some of the most eminent painters of the Italian, Flemish, Dutch, and French schools, we seek for instances of genius and celebrity in artists of our own country; and the name of Sir Joshua Reynolds is foremost on the list. His birth took place on the 16th of July, 1723, at Plympton, in Devonshire. His father, the Rev. Samuel Reynolds, had eleven children, five of whom died in infancy. He was master of the Grammar-school at Plympton, and he instructed his son in the classics himself.

When quite a child, Joshua's great delight was in copying his elder sister's drawings, and some prints which he found in his father's books, particularly in Dryden's translation of Plutarch's Lives; and in his eighth year he made himself so completely master of a treatise on perspective, which he accidentally met with, that he never had occasion afterwards to study any other book on that subject. He then put his knowledge into practice, by drawing, according to rule, the Grammar-school of Plympton, which was a building raised on stone pillars; and he accomplished his task so well, that his father was struck with this evidence of his little son's talents, and being fond of drawing himself, he encouraged his child in his love for the art.

Young Joshua now began to take the likenesses of his family and friends with tolerable success; and the perusal of Richardson's Treatise on Painting so delighted him, and inspired him with such enthusiastic feelings with regard to Raphael, that he considered that great painter to have been the most illustrious character of either ancient or modern times.

Until he was about seventeen years of age, he exercised his juvenile pencil in different parts of his native county; and at that period his father placed him under the tuition of Hudson, who was also a native of Devonshire, and the most distinguished British artist of that day. He remained in London, with Hudson, three years, and then left him in consequence of some slight disagreement, and returned to Plympton; this he afterwards considered to have been a fortunate circumstance, since it induced him to abandon the tame and insipid style of his master, and to adopt a manner of his own.

Reynolds was in his twenty-third year when his father died, and the young man was left to make his own way in the world; and, although he is said to have made but few efforts, and to have improved but little during the three preceding years, he now devoted himself assiduously to the practice of his profession, and, after the lapse of about four years, having been introduced to Lord Mount Edgecumbe, and to Captain, afterwards Lord Keppel, the latter, upon being appointed to a command in the Mediterranean, invited Reynolds to accompany him on the voyage. Having spent two months in the island of Minorca, he sailed for Leghorn, whence he proceeded to Rome.

The works of Raphael, in the Vatican, did not at first make that striking impression on him which he had anticipated; this mortified and dejected Reynolds, but, with becoming diffidence, he imputed the disappointment to his own want of taste, and his incapacity to appreciate the real excellence of a painter of whom he had conceived so exalted an opinion. He was, however,

consoled by the assurances of those with whom he conversed on the subject, that a similar effect had been produced on many persons of acknowledged genius; as the beauties of those great performances are by no means superficial, and require to be studied by the eye of a real artist in order to discover and appreciate their genuine merit.

In his Notes on Du Fresnoy, he says: "Notwithstanding my disappointment, I proceeded to copy some of those excellent works. I viewed them again and again. I even affected to feel their merit, and to admire them more than I really did. In a short time a new taste and new perceptions began to dawn upon me, and I was convinced that I had originally formed a false opinion of the perfection of art; and, since that time, having frequently revolved the subject in my mind, I am of opinion that a relish for the higher excellences of the art is an acquired taste, which no man ever possessed without long cultivation, great labour, and attention."

It is not probable, however, that when at Rome he spent much of his time in copying, for in a preserved fragment of his writing he says, "the man of true genius, instead of spending all his hours as many artists do while they are at Rome, in measuring statues and copying pictures, soon begins to think for himself, and endeavours to do something like what he sees:" but he minutely examined the works of the great masters, and fixed in his mind their peculiar and characteristic merits.

Reynolds in the same paper says, that he considered general copying placed the student in danger of imitating without selecting; and that, as it requires no effort of the mind, those powers of invention and disposition, which ought particularly to be called out and put in action, lie torpid, and lose their energy for want of exercise.

After an absence of three years, he returned to England, and hired a large house in Newport-street, in London; and the first specimen he gave of his great ability is said to have been a boy's head surmounted by a turban, in the style of Rembrandt, which so attracted the attention of his old master, Hudson, that he called every day to watch his progress, and perceiving at last that there was no trace of his own manner in any part of the picture, he exclaimed:—"Reynolds, you don't paint so well as when you left England!"

He soon afterwards painted a whole length portrait of his friend and patron, Admiral Keppel. It was so admirably executed, that it at once placed him at the head of his profession as a portrait-painter.

Reynolds possessed the art of uniting to a dignified characteristic resemblance of the head, an endless variety of spirited and graceful attitudes, picturesque back-grounds, novel and striking effects of light and shade, with great richness and harmony of colour. His performances at this period did not, however, possess those excellences to the degree which is observable in his later works; for he was one of the few whose efforts to improve ended but with his life. He was accustomed to say, that he never began a picture without a determination to make it his best; and his favourite maxim, which he was fond of repeating continually, that "nothing is denied to well-directed industry," seems to have been justified by his own unceasing progress.

Reynolds's portraits were not only correct likenesses,

but he had the happy art of diving into, as it were, and embodying the minds, habits, and manners of those who sat to him.

Though the landscapes forming the back-ground of many of his portraits are extremely beautiful, he seldom exercised his hand in regular landscape-painting. In the historical department, however, he was eminently successful, and has not only enriched various collections at Rome by his works in that higher branch of his art, but he extended the fame of the English school of painting to other foreign countries.

Soon after his return from Italy, Reynolds became acquainted with Dr. Johnson, and a friendship was afterwards formed between those two great men, which lasted until the end of their lives. Reynolds supplied his learned friend with three essays on painting, which were published in the *Idler*, in the latter part of the year 1759:—these essays were his first literary productions.

In December 1768, His Majesty, George the Third, was pleased to incorporate, by charter, the Royal Academy of Painting, Sculpture, and Architecture, to be composed of the ablest and most respectable artists resident in Great Britain. Reynolds was unanimously elected president, and shortly afterwards the king conferred on him the honour of knighthood.

The expenses of this new institution were at first only partly met by the product of annual exhibitions of works of art, and the deficiency was supplied out of the king's privy purse. The aid of his Majesty's bounty was required for a few years, but the exhibition became eventually so profitable, as to suffice for more than the support of the establishment; and it still continues to afford a cheap and delightful annual gratification to the lovers of the fine arts, and to encourage the taste for cultivating and improving them.

Sir Joshua Reynolds, when president of the Royal Academy, voluntarily undertook the task of giving periodical lectures on painting; and, between the years 1769 and 1790, he delivered fifteen discourses, which contain such just criticisms on that difficult subject, couched in such clear and elegant language, that they compete with the efforts of his pencil as monuments of his fame.

The Empress Catherine of Russia was so pleased with the perusal of these lectures, that she sent Sir Joshua a gold box with a *basso-relievo* of her Imperial Majesty on the lid, set round with diamonds. Within the box was a complimentary note written with her own hand.

In 1773, the University of Oxford honoured Sir Joshua Reynolds by conferring on him the degree of Doctor of Laws. In the summer of 1781, he went to the Netherlands and Holland, and on his return he wrote an account of his journey. It contains much excellent criticism on the works of Rubens, Vandyck, Rembrandt, &c., which he saw in the churches and collections at Antwerp, Brussels, Ghent, in the Dusseldorf gallery, and at Amsterdam.

The elegant translation of Du Fresnoy's *Art of Painting*, by Mr. Mason, was published in 1783, with a very ingenious commentary by Sir Joshua Reynolds, consisting chiefly of practical observations on, and explanations of, the rules laid down by the author of that poem; and in the following year he was appointed principal painter in ordinary to His Majesty, in which office he continued until his death.

Sir Joshua had now reached the highest step in his profession; but he was a man whom prosperity could not spoil. His whole life, until his sight failed him, was passed in the unwearied practice of the art which formed his chief delight. His house was filled to the remotest corners with casts from the antique; statues, pictures, drawings, and prints by the various masters of all the different schools and nations; and thus he was constantly surrounded by objects of amusement, of study, and of competition.

Sir Joshua Reynolds was rather under the middle size; his complexion was florid, and his countenance had an honest, lively, and pleasing expression. His manners were polished and agreeable, and he possessed a constant flow of spirits which rendered him at all times a most desirable companion. His hours of recreation were chiefly passed in the society of his numerous friends and acquaintance; and at his hospitable table were assembled, in succession, for above thirty years, almost every individual in the three kingdoms who was distinguished for his attainments in literature and the arts, or who was remarkable for his eminence in the pulpit or at the bar, in the senate or in the naval and military service.

This amiable man was always ready to be amused, and to contribute to the amusement of others, and anxious to receive information on every subject which presented itself. In the exercise of his professional talents, he was, as we have shown, indefatigably assiduous, and he neither suffered a failure to make him despond, nor success to render him negligent.

In conjunction with Dr. Johnson, Sir Joshua established the Literary Club, a society which can boast of having had enrolled among its members many of the most enlightened characters of the last century.

From the period of Sir Joshua's return from Italy, he had the misfortune to be very deaf; this affliction arose from a severe cold which he caught when painting in the palace of the Vatican near a stove, which attracted the damp vapours of the building. When in company with several persons, he was obliged to use an ear-trumpet to enable him to enjoy and share in the conversation of his friends; and such was the serenity of his temper, that what he did not at once hear he never troubled those with whom he conversed to repeat.

For a long series of years, Sir Joshua enjoyed excellent health, which has been in a great manner attributed to his custom of standing to paint; but in the year 1782 he was afflicted with a paralytic affection, from which he soon recovered; but in 1789, whilst painting the portrait of Lady Beauchamp, his sight became seriously affected, and it was with difficulty that he could proceed with his work. He had recourse to the aid of the most skilful oculists, but he was shortly afterwards deprived of the sight of his left eye.

After many struggles, he made up his mind to desist from painting, lest his right eye should also fail him. This resolution must have been the result of a painful effort, since it deprived him of an occupation, which he loved more for its own sake than for the great emolument which it produced. Nevertheless, his usual flow of spirits remained unchanged, and he enjoyed the society of his friends as much as ever. In the latter part of the year 1791, however, he became afflicted with disease of the liver; he bore this painful malady, and a confinement to the house of nearly three months, with

great fortitude and gentleness, and expired at his house in Leicester Fields, on the 23d of February, 1792, in the sixty-ninth year of his age.

On the 3d of March following, his remains were interred in the crypt of St. Paul's cathedral, near the tombs of Sir Christopher Wren and Vandyck. A great number of the most distinguished persons in this country attended his funeral, and the pall was supported by three dukes, two marquesses, and five other noblemen: indeed, every respect that could be paid, by an enlightened nation, to the memory of worth and genius, was displayed on this occasion.

THE FALSE MERCHANT.

SIR FELIX was a warrior of high prowess, but therewithal of small possessions and slender income, and careful of his little patrimony. Summoned to the defence and rescue of the Holy Sepulchre, he looked around for one in whose hands he might repose confidence: for he had sold his few fields in order to raise a sufficient following of armed esquires to enable his banner to be raised with credit on the fields of Palestine. Some little of his money yet remained, and Sir Felix desired to place it with some man of trust, that it might remain for him, should he ever return from his hazardous expedition.

Among all the merchants of the imperial city no one bore a higher or more extended reputation than Cautus; from east to west, from north to south, his agents were in motion, and every nation recognised the power and the energy of the great Roman merchant; the wild hordes of the deserts of the east, and the roving bands of the Scythians, were alike in his pay,—the hired guardians of the long files of camels, or the countless waggons that bore his goods from one nation to another people.

"His argosies with portly sail,—
Like signors and rich burghers of the flood,
Or as it were the pageants of the sea,—
Did over-peer the petty traffickers,
That cowered to them, did them reverence,
As they flew by them with their woven wings."

To outward appearance, no man was more calm, or less excited by good or evil fortune, than Cautus. The least part of his affections seemed placed on his many ventures; he cared little how the wind blew, whether fair or foul, and seldom consulted in his maps for the ports or tracks to or over which his vessels were sailing.

"His ventures were not in one vessel trusted,
Nor to one place; nor was his whole estate
Upon the fortune of a present year;
Therefore his merchandise made him not sad."

To this merchant Sir Felix went.

"Good Sir," said the knight, "I come to entrust you with the little that remains to me of my paternal fortune, after raising my followers for the Holy Land, and furnishing their and my equipments. There are a thousand pieces of gold; receive them in trust for me should I ever return. If I fall in Palestine take them to yourself. For nor wife, nor child, nor relative have I, and of my wealth none can I take with me to the grave."

"Freely do I receive the trust, Sir Knight, and

honestly will I, if it so please you, employ your money until you come, that you shall receive back your own with interest."

"Nay, nay, good merchant, I am no trader; make thou what thou wilt of the gold, so that I do but regain my money on my return."

With these words Sir Felix turned to leave the house of the merchant, when Cautus stayed him.

"Sir Knight,—stay, Sir Knight, until I can give you a written acknowledgment of the trust, and a bond to return it on your demand."

"Nay, nay, Sir Merchant," rejoined the knight, "no scholar am I. If I cannot believe the word of Cautus, how can his bond profit me?"

Years passed over before the merchant and the knight met again. Mixed fortune had followed the merchant; some of his ventures had gone to wreck, but the majority had come to a good market, and the wealth and reputation of Cautus was greater than ever. Far different had been the fortune of the crusader. His life indeed had been spared to him, but sickness had borne down his frame, and death in every form had destroyed one by one the gallant and faithful band that had followed his person. Eager to regain the small sum he had deposited in the hands of Cautus, the knight made his way to the imperial city.

Meanly clothed in a pilgrim's dress, Sir Felix entered the splendid house of the merchant.

"What news, Sir Pilgrim?" said Cautus.

"But little good, Sir Merchant. Disease and war wear down the bodies of the holy warriors, and dissensions weaken their strength. I, too, have suffered; and now I return to redeem the pledge with which I entrusted you on my departure."

"The pledge, good pilgrim—what pledge?"

"Dost thou not know me?" asked the knight, as he bared his face and head. "Sore as disease has wasted me, many must there be that know me."

"Sir Pilgrim, I know thee not—who art thou?"

"Am not I the knight Sir Felix, and art not thou the merchant Cautus, in whose hands I placed a thousand pieces of gold, when I sailed for the Holy Land?"

"Nothing know I of thee or thine, Sir Knight; but come, if that thou sayest be true, show me my bond, and I will pay thee that I owe."

"I have no bond," rejoined the knight.

"No bond, Sir Knight,—and yet wouldst persuade a merchant that thou didst entrust him with a thousand pieces of gold? Go to, ask of any man whether the merchant Cautus ever takes a pledge without giving his bond. Go to,—thou art a bold impostor."

"If thou wilt deny thy trust, Sir Merchant, at least have pity on my distress, and of thy abundance give me that which thou dost deny me of my right."

"Away, Sir,—away, Sir; to a case of real woe and misery, the ears of Cautus and his wealth were ever open, but to an impostor he has nothing to give but punishment. Go, Sir Pilgrim, for thy garb's sake I refrain from giving thee up to justice."

Driven from the merchant's house amid the sneers and threats of Cautus and his subordinates, Sir Felix wandered haplessly through the noisy city, and sought the silence of the fields without its walls. Wandering along a bye-road, deeply grieving over his miseries, the knight met an old and feeble woman, dressed like himself in the weeds of a pilgrim. Hardly able to support herself on her staff, the old woman tottered along, stumbling over the stones that lay scattered in her path. In pity on her condition, Sir Felix moved some of the impediments out of her path, and assisted the devotee to a part of the road whereon her shoeless feet might walk with less pain and discomfort.

"Thanks, good father, for thy kindness. Old as I am, and worn with fasting, prayer, and travel, methinks my aged features bear a less mournful appearance than thine."

"Good mother," rejoined the knight, "sorely have I suffered in the Holy Land by disease and wounds; but now more grievous is my loss, for he to whom I had entrusted the little remnant of my property denies the pledge, and drives me from his house as an impostor."

When the old devotee heard the whole of the knight's story, she bade him take comfort and follow her advice: then the old devotee sent for a crafty workman, a man of trust and ability, and he made by her order ten large and fair chests of wood, well adorned with ornamented locks and hinges, and enriched with curious devices and colours on the outside. When these chests were well filled, she sent for ten porters, and told them to take the ten chests to the house of Cautus, each successive man to be at least several minutes after his predecessor. With the workman she went herself to the merchant's house, and told Sir Felix to come in with the porter that brought the first chest.

"Good mother," said Cautus, as soon as he saw the old woman come tottering in, and recognised her as a devotee of great repute, "good mother, what can I do for thee?"

"My son," replied the old woman, pointing to the workman, "this my friend leaves Rome to-day for Egypt, and would find some safe place for his great wealth. To thee, my son, for thy known probity, have I brought him; and look, where the first of the ten chests in which it is contained is now being brought hither."

At this moment the porter entered with the first chest, and placed it with apparent difficulty on the ground. Hardly had Cautus expressed his thanks to the old devotee, and her supposed friend, before Sir Felix entered, and not far behind him was seen another porter staggering under the second chest. Only too glad to sacrifice the thousand pieces to obtain the treasure of the ten chests, the merchant hastened to Sir Felix and embraced him with every demonstration of joy.

"Ah, my friend, my dear knight! where have you been? when did you return? Receive, I pray you, the gold you entrusted to my care, and take the interest it has made during thy absence,—three hundred like pieces. Come, my dear friend, receive thine own."

Whilst Cautus was paying Sir Felix his money, the ten chests continued to arrive, until the whole number were arranged on the floor, and gladdened the eyes of the merchant with their external glitter, and apparent weight.

"My son," said the old devotee, "there be yet more than these ten chests; we will go and see after them; do thou take care of these during our absence."

With these words the old devotee and the workman left the shop of Cautus and followed Sir Felix. Every day, every hour, Cautus expected their return, but they came not; the ten chests were borne into another ware house, and the merchant regarded them as his own, as he had given no document for them. After much delay, his avarice overcame him, and he proceeded to open the first chest. The labour was great, but endured gladly in the hopes of the treasure within: at last, lock after lock was forced, and the lid kept down by its own weight alone. Sending every one away, Cautus entered the closet and approached the chest: with a trembling hand he raised the heavy lid, and held the lamp over the box, that he might better scan its contents. With a sudden scream he reeled backwards, and the lamp fell from his hand, and was broken on the stones with which the box was filled. With the three hundred pieces he had given to the knight, he had purchased nought but tons of pebbles.

Poetry.

In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.

THE RETURN OF THE SENNERIN.¹

From the German of Anastasius Grün, by M. H.

THE mountain tops are glancing
With ice all silvery sheen,
And autumn from the valley
Strips the wreaths of leafy green.

The slopes around the village
Still verdant meadows show,
But all the meadow flow'rets
Are withered long ago.

Hark! Hark! What from the mountain
Like joy-bells peals along?
What through the dale resoundeth
Like sweetest bridal song?

'Tis, with her herd returning,
The youthful Sennerin;
Down from the Alps she cometh,
Her home once more to gain.

The fairest of her heifers
Bears tinkling bells with pride,
With fresh flower-wreaths bedecked,
Moves foremost like a bride.

Round her in frolic measure
The whole herd press and play,
As gay young friends together
Make glad some festal day.

The swarthy bull, as stately
As such a chief should be,
Brings up the rear, as Abbot brings
A bridal company.

Before the nearest dwelling
Three times the maiden cries;
Through alp and dale and village
Far, far, the glad sounds rise.

The matrons and the maidens
All quickly round her stand,
And warm and true the Sennerin
Reaches to each her hand.

"A thousand welcomes, fair and fresh,
Brought from green alpine height!
How long, how very long since we
Have met each other's sight!

"For all the long, long summer
I sat there quite alone
With the herd and with the blossoms,
As sunlight—moonlight shone."

With look serene her greeting
She gives to the young men,
To one alone, the bravest,
She gives no greeting then.

He never seems to heed it,
Lets it pass with smiling mien;—
Can it be true that fair one
So long he hath not seen?

He wears a hat all garlanded
With Alpine roses round;—
Ne'er blooming in the valley
Are such Alpine roses found.

(1) Sennerin.—The young girl who has the care of the herds sent to the higher region of the Alps in summer.

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne*.

ANECDOTE OF LORD KENYON.

AN interesting anecdote of Lord Kenyon's sensibility was related in the House of Commons by Mr. Morris, in the debates of 1811. Of the occurrence that gentleman had been an eye-witness. "On the Home Circuit," he said, "some years since a young woman was tried for having stolen, to the amount of forty shillings, in a dwelling-house. It was her first offence, and was attended with many circumstances of extenuation. The prosecutor appeared, as he stated, from a sense of duty; the witnesses very reluctantly gave their evidence, and the jury still more reluctantly their verdict of guilty. The judge passed sentence of death; she instantly fell lifeless at the bar. Lord Kenyon, whose sensibility was not impaired by the sad duties of his office, cried out in great agitation from the bench, 'I don't mean to hang you; will nobody tell her I don't mean to hang her?' I then felt, he justly added, 'as I now feel, that this was passing sentence, not on the prisoner but on the law.' This deserved reproach never startled the learned judge, who was a devout believer in the perfection of the penal laws; and, without rising superior to the prejudices of the age in which he lived, gained a reputation for mercy above his colleagues, by yielding more frequently than they did to the impulses of compassion. His humanity, active in cases of life and death, so far as his conscience would allow, was less alert in behalf of those criminals to whom secondary punishments had been awarded; and never slumbered so soundly, as when a fashionable libertine was to be amerced in damages; a seditious libeller to be sent to gaol, or a knavish attorney to be struck off the rolls."—*Townsend's Lives of Eminent Judges*.

It is much safer to reconcile an enemy than to conquer him. Victory deprives him of his power, but reconciliation, of his will: and there is less danger in a will which will not hurt, than in a power which cannot. The power is not so apt to tempt the will, as the will is studious to find out means.—*Feltham's Resolves*.

In former times a popular work meant one that adapted the results of studious meditation, or scientific research, to the capacity of the people: presenting in the concrete by instances and examples, what had been ascertained in the abstract and by the discovery of the law. Now, on the other hand, that is a popular work which gives back to the people their own errors and prejudices, and flatters the many by creating them, under the title of the public, into a supreme and unappealable tribunal of intellectual excellence.—*Coleridge*.

MEMOIR OF BERNARD DE PALISSY,

WITH SOME ACCOUNT OF COLOURED GLASS AND OF ENAMEL.

THE two problems of Aristotle, (if indeed they ever were propounded by that philosopher,)—Why do we see through glass? and, Why is it not malleable?—comprise, perhaps, the earliest written mention made of that substance. Many authorities concur in assigning the merit of the discovery to the Phœnicians, and the assertion of

Pliny is often cited which attributes it to accident. Some storm-driven mariners were boiling their food on the sands, at the mouth of the river Belus, (a small stream running from the foot of Mount Carmel in Galilee,) where the herb kali was growing abundantly, and are said to have perceived, that the sand, when incorporated with the ashes of this plant, melted, and ran into a vitreous substance. It is certain that the sand about this spot was well adapted to the manufac-

ture; and probably the glass-houses of Tyre and Sidon were supplied thence with this material, which may have given rise to the tradition.

According to the Venerable Bede, we are indebted to the Abbot Benedict or Biscop, the founder of the Monasteries of Jarrow and of Weremouth, for the introduction of glass into England: he brought over into our land, from France, glaziers, as well as masons; by which means, the stately Abbey of Weremouth became celebrated, not only for its architectural beauty, but also for the glass windows with which it was decorated. As soon as glass became known in France, it was used as a luxury in the dwellings of the rich; and in this respect they were far before their English neighbours; for it was not until the eleventh century that glass windows were at all commonly used, either in private dwellings, or in public and religious edifices, throughout England. Even as late as the reign of Elizabeth, the glass in the windows of Alnwick Castle was taken down from the nails which attached it to the frames, and laid by, during the absence of the Earl and Countess of Northumberland: and, generally speaking, it was considered rather in the light of moveable furniture, than as forming part of the house.

It appears probable, that the art of colouring glass was discovered and prosecuted at a period very little subsequent to that of the manufacture of the article itself: the most ancient authors, who have mentioned the existence of the material, have also recorded the fact of its being tinged with various colours, in imitation of gems. It was long, however, before the art of transfusing the colouring matter through the whole mass of the glass became known. The date of true painting on glass may be fixed about the middle of the fifteenth century; its tints were then enamelled by the action of fire, and thus remained in pristine beauty, as long as a fragment was left of the window they had adorned. Jacques l'Allemand, and the celebrated Albert Durer, in Germany; Henri Mellein at Bourges, and Leprince at Beauvais, were the first men of genius who responded to the call of the newly awakened science: but while they were occupied in developing all its powers, and applying them to their noblest use in decorating the Cathedrals and Churches of their native land, others, again, thought that it might likewise be employed on porcelain, so that the potteries of modern Europe should rival those of the ancient world.

It may be well, before we enter on the life of the singular man to whom the art of the potter is so much indebted, to give some account of that peculiar branch of it which he brought to a high degree of perfection; and, in doing so, the connexion between painting on glass, and the production of porcelain, will become evident. Enamel in glass made opaque by the oxide of tin, and rendered fusible by the oxide of lead: all glasses that contain lead participate in the properties of enamel: it is necessary to vary the composition of the glaze, in order to suit the different materials that form the body of the ware; since that would be a very fine glaze for one mixture of earths, which would be wholly inappropriate to another, proving deficient in lustre, and being liable to crack. No philosopher had then discovered, as long afterwards Reaumur did, that "the Chinese porcelain was a semi-vitrified compound, in which one portion vitrifies at that degree of heat, and enveloping the infusible part, produces that smooth, compact, and shining texture, as well as transparency, which are distinctive of true porcelain." At the time Bernard de Palissy was seeking the secret of enamel, only the coarse earthenware was known in France, which served for the commonest purposes; and, if not its inventor, he had at least the merit of discovering it as it were a second time, and of introducing it into his native country. He was born near Blon, a village in the old diocese of Agen, in 1499;

his parents, in spite of their poverty, had him taught reading and writing, which at that time was a great deal. A land surveyor, who had come to Agen to lay down a plan of that part of the country, remarked young Bernard's singular precocity, and the attention with which he watched his operations, and asked his parents' leave to take him away with him to learn his business.

This was readily granted, and such progress did he make in practical geometry, that he was often employed in making out charts of contested property by the local authorities, and in mapping out districts, when he had scarcely ended his apprenticeship: but, besides this, which was his regular avocation, he occupied himself in drawing and in painting on glass, and was sent for to many places, as his name became known, to adorn both churches, and the castles of the nobles, with windows of stained glass. In 1539, Palissy quitted his native village, and established himself at Saintes, where he married: here he had the mortification of seeing his various modes of obtaining a livelihood become daily less profitable, and employment itself was often not to be had. In the comparative idleness which thus was forced upon him, he gave himself up more and more to the indulgence of scientific theories; he felt the working within him of energies which had never yet been called into full action, and, in this state of mind, a beautiful cup of enamelled porcelain, which had probably been made at Faenza, in Italy, fell into his hands. This happy accident gave a fresh impulse to his genius, and was the means of leading him into the path in which he was destined to excel: from that moment he thought only of how to produce a similar vase; what had once been accomplished he knew might be done again, but he had not the power of obtaining the experience of others, and his first essays were made in the dark. Giving himself wholly to this one object, he entirely abandoned painting on glass, which, however unproductive he had found it, had at least sufficed to give bread to his family. Palissy burnt the clay himself, mixed it with various ingredients, covered it with ever varying preparations, and tried them, with constantly renewed hope, in the furnaces of glaziers, and those of potters; but he was doomed as constantly to disappointment. He represents himself in his "*Traité de l'Art de Terre*" as alternately building and demolishing his furnace, for on this, he found at last, that his success would ultimately chiefly depend. In those days, a man who, like himself, was endowed with genius, which placed him in advance of his neighbours, and with perseverance to carry out his views, was almost sure to be suspected of sorcery, and his friends soon began to look upon him with terror; others imagined him to be a coiner of false money, from which one would have thought his poverty must have been a safeguard, and the more charitable thought him mad: but worse than all this was the consciousness of the poverty to which he was reducing his family.

His wife and children continually implored him, with tears, to renounce his chimerical hopes, and to return to any one of his former honest employments, which would bring back comfort to his home. He has described in terms of bitterest feeling the conflict in his own breast at this time, and we cannot fully applaud his determination under such circumstances to persevere in his perilous course; yet he bore outwardly a cheerful countenance, and strove to inspire them with the confidence he felt himself, that he should one day place them in affluence, and be enabled to overpay with happiness all the privations they were enduring then. Fifteen years thus passed away: Palissy was still firm in his conviction, and yet had not succeeded; and nothing short of producing enamel in all its perfection would satisfy him.

One day, when he thought himself on the very point of attaining the great object of his life, a workman, whom he had engaged to assist him in his labours, suddenly announced his intention of leaving him, and

insisted on receiving the wages that were due to him: Palissy had no money, and paid him with the few clothes he had left. He had now to do all his work alone, to prepare his colours, and to heat and watch the furnace that his own hands had made. Once more he found himself on the verge of success: he placed in his oven a vase, on which his last hopes were centred, and ran for wood to feed the fire; but what was his consternation at finding it all consumed? He stood for a moment overwhelmed with despair, but it was only for a moment;—he rushed to his garden, and tore up the trellis that supported his fruit-trees, broke it in pieces, and heated his furnace: up sprang the flame once more, then sunk into the deep red glow that promised the fulfilment of his desires; but again it burnt low, and this time, he lost no time; for want of fuel, he had recourse first to his chairs and tables, then to the doors; after them, the window frames were consumed, and at last the very flooring of his house fed the furnace.

It was the final effort of the artist, but this effort insured his triumph. One long shout of joy echoed through the dismantled dwelling; his wife and his children ran to him. Was it a cry of exultation or of despair? Palissy showed them the vase he had just taken out of his furnace: it was bright with the imperishable colours that till then he had only seen in dreams, since he had once beheld the goblet of Faenza! While yet they scarcely could believe that their trials were over, he was again calm: he had always expected to succeed sooner or later, and he had now to perfect his discovery. It was not long before his beautiful works found their way into all parts of France, and fortune smiled at last on the man of genius who had endured so much.

The king, Henry the Second, wished for vases and figures to adorn the gardens of his palace, and Palissy was commissioned to make them: soon afterwards he sent for him to Paris, and gave him apartments at the Tuileries, with a patent, which set forth that he was the inventor of a new kind of pottery, and under the especial protection of the king, the queen, (Catherine de Medici), and the Constable de Montmorenci: he was known at Paris by no other name than that of Bernard des Tuileries.

Bernard de Palissy is worthy of our admiration, not only for the intelligence, and the love of the beautiful, evinced by his discovery, but also for its utility. It was to him in process of time that France owed her transparent porcelain, which even now England can scarcely rival: he may be styled the father of ceramic art; but the services he rendered to his country did not end here. He showed himself no less persevering in imparting to others the knowledge he had won with so much toil and sorrow, than he had been in obtaining it for his own advantage. He formed the first cabinet of natural history that France had ever possessed: he lectured on this science, as well as on those of chemistry and agriculture, before the ablest physicians and the profoundest scholars of his day; and in his lectures he substituted positive facts, and ocular demonstration, for the fanciful and superstitious doctrines of the science of that period. Palissy had thought deeply, and struggled long to bring forth his thoughts into actual realities, and now he spoke simply, but with the eloquence of truth, knowing that neither his words, nor his life, would fail of influencing the minds of his audience. Thus also he wrote with singleness of purpose, and in a style which, though he knew neither Latin nor Greek, reminds one of the style of Montaigne. Every page of his "*Traité de l'Art de Terre*" breathes an unspeakable charm; there he tells us the story of twenty years of anxiety, labour, and dire privation, and we feel our hearts sink at the recital of so much suffering. Bernard de Palissy warmly embraced the principles of the Reformation. He was arrested at the time of the first edict against Protestants, framed at Orleans by Henry the Second in 1559: he recovered his liberty in consequence of the intercession made for him

by the Constable de Montmorenci to the queen, and it was owing to the same powerful protection that he escaped from the massacre of Saint Bartholomew. In the course of time, however, he was again accused of heresy, and dragged to the Bastille, within whose dismal walls he died with consistent firmness when he had passed his ninetieth year. E. O.

SOME PASSAGES FROM THE JOURNAL OF A WILTSHIRE CURATE.

December 20.—This day passed quietly, though I cannot say very pleasantly; for Loster, the grocer, sent me in his bill. It was larger than I expected, considering what we have had from him, although we never sent for anything without writing it down ourselves. But, though it agreed with our account, he had increased the prices of every single thing. The worst is, there are still some arrears from last year, which he begs me to pay, as he is in great want of money. The whole amounts to eighteen shillings.

I went to Mr. Loster, a civil and well-behaved man; and hoped to persuade him to take half on account, with the promise that I would pay the remainder at Easter. But he was inflexible, and regretted that necessity might oblige him to have recourse to extreme measures. If it had been possible, he said, he would willingly have waited, but he was obliged to make a remittance within three days, and, in trade, punctuality is everything. I saw that any further remonstrances were useless, and as I could not run the risk of being arrested for debt, as he threatened, I sent him the entire sum: by which means, I now possess but eleven shillings in the world! Please God, the actor may soon repay my loan; if not, I know not where to turn for help. But if you know not, weak and doubting man, there is One who knows it! Why is your heart so troubled? You have no crime wherewith to reproach yourself, and in the eyes of God poverty is no sin!

December 24.—After all, what slight things will make one happy. We are all delighted with Jenny's new gown, in which she looks as lovely as a bride. She means to appear in it, for the first time in public, at church on Christmas-day. She tells me every evening how small the day's expenses have been. To be sure, she sends us all to bed at nine o'clock, to save coals and candles: but there is not much harm in that: the girls work harder in the day-time, and they lie chattering together till past midnight. We have a good provision of potatoes and dried vegetables, and some bacon; and Jenny thinks we can manage to get on for six or eight weeks without running into debt: which would indeed be a great feat; and, before that time, we trust Fleetman will repay me honourably what I have lent him. If I ever express the slightest doubt upon the subject, Jane gets quite angry with me; she will let no one speak ill of the actor. He is constantly the subject of our conversations; it is strange how much the two girls have to say about him. His appearance was a great event in the uniformity of our life, and will give us something to talk about for at least half a year. Jenny's indignation is really quite amusing when Polly teases her, by saying, "What a pity he is nothing but a player!" She tells her of all the great performers in London, who have been known even to dine with royal princes, and says she is certain Fleetman will become one of the very best actors in the world: that he has great abilities, much grace and dignity, and a beautiful choice of language in speaking.

"Yes, indeed," said Polly, silly; "a beautiful choice of language, for he called you an angel!"

"And you too!" said Jane, half angrily.

"Oh, yes, I was thrown in to the bargain, but his eyes were fixed on you when he said it."

This childish talk made a painful impression on me. Polly is growing up; Jane is eighteen. What prospect have I of ever being able to provide for the poor girls? Jane is a lovely creature, modest, and well-educated; but everybody in Cricklade knows how poor she is, and it will be difficult for her to find a husband. Now-a-days, an angel without money is not thought half so much of as a devil with a sackful of guineas. The only advantage that Jenny gets from her sweet face is, that she is kindly treated wherever she goes. The other day, when she carried the grocer his money, did he not make her a present of a pound of almonds and raisins; and assure her that he was much grieved at being forced to take the money from me; and that, if I chose to employ him again, he would give me credit till Easter? He never said as much to me! But if anything were to happen to me, who would protect my unfortunate children? . . . Who but their Heavenly Father, and their own good name, which may procure them some honest service? Let me not torment myself about the future.

December 26.—These last have been two painful days. Never have I passed so sad a Christmas. I preached five times in the two days, and in four different churches. The roads from one village to another are dreadful; the wind howled, the rain fell in torrents. I begin to feel that I am no longer young. I am not as active or as cheerful as I used to be. Perhaps living so much upon potatoes and vegetables, and drinking nothing but water, has made me thinner and weaker than I used to be.

I dined both days with Farmer Hurst. People are more hospitable in the country than in towns; it is more than six months since anybody has thought of asking me to dine with them here. What plenty! what profusion! Ah, if my poor daughters had only been with me! Could they but have had the remnant of the farmer's feast to celebrate their Christmas! However, they have had some cake for their share, which they are enjoying famously at this moment. How lucky it was, that I had courage, when the farmer and his wife pressed me to eat, to say that, if they would allow me, I should like very much to take some cake home to my daughters. These excellent people made me up a large parcel of good things, and, as it was raining furiously, sent me home in a covered cart. Certainly one ought to be content if one has enough to satisfy hunger and thirst, but it is impossible to deny that a good dinner is a very comfortable thing. One feels more in charity with the whole world; one's ideas are more liberal and enlarged.

December 27.—This has proved a most joyful day; but we must learn moderation even in joy. This is a lesson which I must teach my daughters; and therefore I have laid aside, unopened, the packet of money which has just reached me from Fleetman. I will not break the seal till after dinner. My ladies are true daughters of Eve; they are dying with curiosity to know what Fleetman says: they have studied the direction over and over again, and take up the packet every minute to examine it anew. To say the truth, I am more astonished than pleased. I lent Mr. Fleetman but twelve shillings, and now, from the superscription, I find he has sent me five pounds sterling. He must have met with some extraordinary good luck.

What a mixture of joy and sorrow is this life! I called this morning on Squire Fieldson, the magistrate, to endeavour to ascertain the truth of a shocking report which reached me yesterday, that Colonel Brooke, of Wottonbasset, had cut his throat. The extreme disorder of his affairs was said to be the reason of this dreadful act. He was a distant connexion of my late wife's, and some years ago I was induced to become security for him for the sum of a hundred pounds, and he still possesses my bond to that amount. The poor man has met with many misfortunes, and latterly has taken to drinking. Mr. Fieldson has rather quieted my anxiety, although the same report had reached him;

but he seems to think it quite impossible that poor Brooke could have made away with himself, at least no official intelligence has been received, so I came quietly home, praying to the Almighty to spare me this new misfortune.

Then it was, as I approached the house, that Polly rushed to meet me, almost breathless with delight, screaming out, "A letter from Mr. Fleetman, father, enclosing five pounds!—it is written on the outside; and there's sevenpence to pay for the postage." And, before I had put down my hat and stick, Jenny, with a face as red as fire, came and put it into my hands. The children seemed really out of their wits with joy. However, I rejected the scissors, which they produced, to open the packet without breaking the beautiful seal, and said, "Now, you see, my children, how much more difficult it is to bear great joy with self-possession and calmness, than great sorrow or distress. I have often wondered at your cheerfulness when we were enduring many bitter privations, and scarcely knew how we should provide for the morrow. Now the first smile of fortune quite turns your little heads; so, to punish you, the packet shall not be opened till after dinner." In vain Jenny assures me, she is not half so much pleased with the money (much as we wanted it) as at the excess of Fleetman's gratitude, and his honourable conduct; she says she is only impatient to know what he says, and whether any good fortune has befallen him. I persist, however, in my determination. This childish curiosity must be punished.

The same Evening.—Our joy is quickly changed to grief. The money and letter were not from Fleetman, but from Dr. Snarl, who informs me, in answer to my letter, that, from Easter next, my duties as his curate cease. He tells me I shall have sufficient time, in the interval, to look out for another curacy; to facilitate which, he not only encloses me the last quarter of my salary in advance, but has given instructions to my successor, if I do not object, to take my duty immediately.

So, then, there was some truth in the reports which circulated in the town, and there may be even some foundation for what I have just heard, that the new curate has received his appointment so speedily, in return for his complaisance in marrying a relation of the rector, whose character was not quite as good as might be wished. So I am to lose my place, and my children's bread, to hide the misconduct of an unprincipled woman!—and I, and my poor innocent girls, are to be turned into the street, because there exists a man base enough to purchase advancement with his own dishonour!

Jane and Polly turned as pale as death when, instead of news from Fleetman, I read out to them the rector's cruel letter; and they found the packet to contain, not the liberal gift prompted by gratitude, but the last and bitter wages of the labour of years. Polly threw herself back in her chair, sobbing aloud; Jane hurried out of the room. My hands trembled so, that the letter fell to the ground. I, however, hastened to my closet, shut the door, threw myself on my knees, and endeavoured to pray, still hearing my poor child's sobs. Soon I arose, consoled and tranquillized, and opened the Bible. The first words on which my eyes fell, were, "Fear not; for I have redeemed thee, I have called thee by thy name, thou art mine." (Isa. xlii. 1.) Fear and distrust fled from my bosom, and, raising my hands to Heaven, I exclaimed, "Yea, Lord, I am thine!" Polly's sobs had ceased; I returned softly to the room; but, when I beheld the sweet child kneeling, her hands folded, while a beam of consolation lighted up her face, I went back to my closet, closing the door gently, that I might not disturb her. Jane soon entered the room, and I then joined my daughters, who were seated at the window. I saw, by Jenny's red eyes and pale cheeks, that she, too, had bitterly felt this last blow. They both looked timidly in my face; I believe they

dreaded to read those traces of despair; but they soon recovered their spirits when I spoke cheerfully to them, and they found me resigned and comforted. I picked up the money and the letter, and carelessly humming a tune, I placed them in my desk. They spoke no more on the subject; I dared not touch upon it again; kindly and tenderly, they wished to spare my feelings, and I feared to betray my weakness to my children!

December 28.—It is well that we let the first fury of the tempest pass without looking too narrowly into the devastation which it must bring with it. We all passed the night calmly, and we now speak of Dr. Snarl's letter, and of my destitution, as a misfortune which is worse in anticipation than in reality. We form a thousand plans for the future, but no one is exempt from this bitter drop;—we three must separate! Nothing better can be devised, than that Jane and Polly should find employment in some honest and respectable family, whilst I travel about in search of an occupation, which shall give bread to myself and children. Polly is as gay as ever; she has been chattering about her dream, and the bishop's mitre. She appears to me to reckon almost superstitiously upon this New-year's gift; for my part, I do not reckon upon it; yet it does so happen, that, at times, I think of it. As soon as ever my successor is ready to come to Cricklade, and take the duty, I will give up my house to him, and seek my fortune elsewhere. In the mean time, I shall write to-day to two old acquaintances at Salisbury and Devizes, to endeavour to find situations for my daughters. Jane would make an excellent nursery-governess. I will not leave them at Cricklade. In this little place the people are narrow-minded, proud, and selfish;—they think of nothing else now but the new curate. Some condole with me, and regret that I must leave them; but I know not if it is from the heart!

December 29.—I have written to-day to the Lord Bishop of Salisbury, representing to him my melancholy, hopeless state, after being so many years a true and faithful labourer in the vineyard of the Lord. He is said to be a pious and kind-hearted man. May God turn his heart towards me!—for, surely, in the extensive patronage which he has at his disposal, there may be some little corner for me. I do not desire much!

December 30.—Merciful God! is there no end to my misfortunes? Is it really come to this? Is there no shelter for my misery and distress but the walls of a prison? Alas, I see too well that it is inevitable!

My brain whirls round; it is in vain that I strive to recover my former composure. I have not even strength to pray! The shock is too great! Yes, I repeat it—a prison is inevitable. I must bring myself to contemplate it without this unspeakable terror. May the merciful Lord have pity on my children! I will not.... I cannot tell them.... Oh, that the hand of death might save me from this disgrace! My limbs fail me.... A cold shudder runs through my veins, the pen drops from my trembling hand....

Some Hours later.—At last, I am better. I strove to throw myself on my knees, to pray to my Heavenly Father; but I was not myself. I sank upon my bed. I think I slept; perhaps it was a fainting fit. I lay there for three hours. My daughters came in search of me; they covered my feet with cushions; they rubbed my hands, and bathed my face with vinegar. I am still weak in body, but my mind is recovering its tone. All that has passed seems to me as a dream! It is too true that Colonel Brooke has put an end to himself. Squire Fieldman sent for me to tell me there was no longer any doubt on the subject, and that he had left an immense number of debts. He told me that my bond was in the possession of Withell, the linendraper, at Trowbridge, who would probably require its payment immediately: he recommended me to take measures to liquidate the debt, and expressed the utmost commiseration for the distressing position in which I had so imprudently placed myself. Good God! A hundred pounds! How

is it possible for me to raise such a sum? My whole property is scarcely worth a hundred shillings! Brooke was always looked upon as a highly honourable man, and supposed to be in good circumstances; how could I have suspected he would come to such a wretched end? The whole of my wife's little property was spent during her long illness; I was even obliged to sell the small piece of land she inherited from her father, at a price far below its value. Now, I am a beggar!—a beggar, but not free; for if Withell is not generous, if he insists upon immediate payment, what is there to save me from arrest—from languishing the rest of my days within the walls of a prison?

Same day. Evening.—Now am I, indeed, ashamed of my weakness. I, a firm believer in an Almighty Providence, a minister of the word of God, to despair; to weep; to lose my senses; to be so utterly cast down at a blow dealt by His hand,—a trial permitted by His mercy and justice! I thank God, I have now done that which is right. I have written to Mr. Withell; I have acknowledged my bond, and at the same time confessed to him my utter inability to meet my obligation; and that he is at liberty to arrest me for debt whenever he thinks proper. If he has any humanity, he will consider my situation, and not proceed to extremities; if not, he may drag me where he will; I will offer no opposition.

When I had performed this duty, I determined to try the courage and strength of mind of my children. I wished to prepare them for the worst. Ah! these girls have surpassed the man in courage; the servant of the altar, in piety and submission to the will of God!

I told them of Brooke's death, of the engagement I was under, and the possible consequences thereof. They listened anxiously and attentively, until I uttered the word, *prison*.

"To prison!" cried Jane, weeping and throwing herself into my arms; "You, dearest father, the best, the most virtuous of men! What have you done to be thus overwhelmed with misfortune! Let me go to Trowbridge,—I will throw myself at Withell's feet, and never rise till he has released you from your debt."

"No, no," said Polly, sobbing, "that would be useless. These tradesmen are all alike. He would not remit one farthing of our father's debt, for all your tears and supplications. I will go; I will bind myself to the linendraper. I will work for him night and day, until the labour of my hands has extinguished the debt."

With such plans as these, they tranquillized themselves by degrees; but they soon comprehended how vain were all their hopes. At last Jane exclaimed:—"Why should we form such fruitless projects! Let us at least wait for Withell's answer; if he is inflexible, we must submit. God is present everywhere. He will not desert you, even in a prison. You will perhaps find greater peace there than in the miserable life we have lately endured; for you are innocent, and shame, at least, can never reach you. We two will go to service, and with the labour of our hands will procure you the necessaries of life. I would even beg for you, were there no other resource. It were both holy and sweet to beg for a father! Sometimes we should visit you. Fear not, you should want nothing,—we would take good care of you. Oh! do not let us despair."

"Yes, Jenny, you are right," said her sister, "those only despair, who have no faith in God. I fear nothing. I will be gay,—gay as I can possibly be when separated from you and my beloved father."

These conversations insensibly helped to calm me. How right Fleetman was, when he said God had given me two angels to support me through the trials of life!

December 31.—The year is ended. In spite of many storms and troubles, it has been rich in blessings and mercies. True, at times we had nothing to spare;

but we have never been in want of the positive necessities of life. My mind was often oppressed with bitter sorrows; but even those cares brought their joys. Now all I possess is barely sufficient to ensure us food for half a year; but how many are there who know not where to look for it the succeeding day. I have lost my curacy, am turned out at my age, without employment or support; have even the fear of a prison before my eyes, where I may languish for years, far from my sweet children — But Jane is right. "God is present everywhere." My innocence will be my support, and a clear conscience will bring peace, even in the depths of a prison. Self-denial is true riches; and the real Christian will equally despise the disgraces and honours of this world. He who thoroughly despises the world has conquered heaven. I find the word of God is daily becoming more clear to me, now that I study it in the school of adversity. The commentaries of scholars may explain its words,—they never reach its spirit; and there is no interpreter of the Gospel equal to the heart. With these grateful reflections I close the year.

I rejoice much that I have persevered lately in keeping this journal. Every man should do so. Man learns thus to know himself better than by the most abstruse studies. When a man daily notes down his own thoughts and feelings, paints his own features as it were, he learns by the end of the year that he has many different aspects. No one knows himself for long together; few know what they were yesterday, still fewer what they will become to-morrow. A journal serves also to strengthen one's confidence in God and Providence; the whole history of the world falls to impress it in so lively a manner, as the knowledge of the thoughts, feelings, and sensations which pass through a man's mind in the space of a few minutes. I have also this year experienced the truth of the old saying, that "misfortunes never come alone;" and also, that "when things are at the worst they must mend;" therefore, now the first shock is over, I rejoice that the worst is come to pass, and that hereafter nothing will have the power of overcoming my fortitude; while, on the other hand, if things go well with me, I rejoice in trembling; but dare not give myself up to joy, the greatest deceiver of the human heart. But it is also true, that no danger close at hand is ever so alarming as when afar off; no storm so black and heavy, as when seen in the distant horizon.

DIARY OF A JOURNEY FROM ALEXANDRIA TO SUEZ.

BY A CADET.

19TH DECEMBER, 184—.—It was on this day that, after braving great perils by sea and land, we arrived in the Bay of Alexandria, at about 4 o'clock in the afternoon, and I rushed up from dinner to look at the city; but we were too far off to see anything distinctly. The steamer immediately became a sort of little Babel inside and out. Inside, were the passengers shouting and screaming for their friends, their luggage, and so forth; and outside, were the boatmen, for we had been surrounded by boats the instant the anchor dropped, screeching, yelling, and fighting like so many fiends.

After some difficulty, four others and myself, having managed to secure a boat, set off, leaving our baggage to come on shore at leisure, and only taking with us a small package each, containing what would be necessary for two or three days.

The distance to the shore was about half an hour's row, and we had got nearly half way when the boatmen stopped, and said they would proceed no further with-

out payment; we threatened to give them a thrashing unless they proceeded, (every thing in Egypt is obtained by thrashing,) and under this persuasion they at last condescended to move on. On reaching the shore we found ourselves in the midst of an immense concourse of men and donkeys, the latter being intended for us to ride, they being in Egypt the universal means of conveyance. It was some distance to the principal hotel, so we thought we could not do better than each to mount one; vain delusion! we might as well have tried to jump over Pompey's Pillar, as to mount in quiet; for, as soon as our intention to take donkeys was known, such pulling and beating of animals, and fighting of men ensued, that, in the course of five minutes, I found that I had tried to mount half a dozen different quadrupeds in succession, for, as soon as I got on one, I was dragged off by the driver of some other, and told that his donkey was the best of all. This went on for some time, till at length, recollecting the advice of one of the mates of the steamer, as to the course to follow in such cases, I gave one unfortunate driver such a pleasant *coup*, that, like the old gentleman in Pickwick, he was effectually doubled up, and they all retired.

The whole of us having then mounted, we started off at a canter, the proprietors of our chargers running after us to keep them going. The donkeys in Egypt are larger, and much stronger and swifter, than those at home; but, alas! we had not proceeded far before one of our steeds tripped and fell, the rider, a brother cadet, being propelled on his hands and knees over his coursers' head. We all wanted to stop; but no, our donkeys would not consent; the bridles were miserable affairs, and the beasts, knowing that their masters were behind, scudded on at a tremendous rate, and the last we saw of C—, this said cadet, was a vision of him scrambling to his feet, and thrashing his unfortunate donkey to make it rise too.

We now proceeded to the post-office to put in our letters, and then started full gallop, shouting like mad, up the principal street of the town, towards Cleopatra's Needle. The street was very much crowded; it was getting dark; and the consequence was, that the people went flying about in all directions to get out of our way, but in vain, for as soon as they avoided one horseman, *i. e.* donkeyman, they found themselves in the way of another. As for me, I rode smack at one old fellow, who was flying for his life from before another donkey, and the result was, he went like a shot into the gutter, whilst the concussion sent me, at an angle of forty-five degrees, right up against another Egyptian mounted on an ass also. It was a regular tilt; my antagonist went clean over, and I only saved myself by clutching fast hold of the saddle. A short ride of a quarter of an hour brought us to Cleopatra's Needle, which of course we admired exceedingly, and then set off back again to get dinner at the principal hotel. In returning we got up a small race, and after a hard struggle I came in second, having witnessed the fall of about half our party, though I myself luckily had not as yet experienced a single tumble.

On arriving at the hotel, we found the Bombay passengers preparing to start for the canal, which communicates with the Nile. Having bidden each other good bye for the present, for we were to meet again at Aden, they departed in omnibusses to the canal, and we walked into the hotel, and into our dinners, for which we were fully prepared.

Dinner over, we got donkeys once more, and rode about for an hour or thereabouts, and then returned to the steamer, which we accomplished with great difficulty, as no boats are allowed to leave the shore after eight o'clock. However, after walking for a mile out of our way, by dint of bribery we succeeded in getting on board and to bed.

20th.—This morning I rose early, having to pack my luggage for our journey, which consisted of a couple of shirts, one pocket handkerchief, (by the bye

mine had been *prigged* from my pocket the night before by some dexterous thief,) hair brush, and a pair of inexpressibles, tied up in a towel; this being all that you are allowed to take with you over the Desert. Then, having eaten our breakfasts, we bid adieu to the steamer and went on shore. Here we found at a rough guess about a million donkeys waiting our approach, and the same scene as that described before having been enacted over again, we rode off to the hotel, where we were told that as the boats started at eleven we had better proceed to the canal immediately.

Off we went like a shot, to see which would get there first, it being a ride of about two miles. On the way just on the outskirts of the town, we passed Pompey's Pillar, not much to boast of certainly. I met with a mishap here, for whilst engaged in looking at the aforesaid worthy's monument, my donkey, which had been going capitally, made a sudden stumble, down he came on his knees, and then down came I, *Heu miserande puer!* smack over his head; luckily I came on my hands, or else I should have sustained some damage, as the road is very hard. However, I picked up myself and my bundle, which I had carried before me (by the bye, the towel had nearly come undone, and revealed all the hidden glories within to the vulgar gaze), and mounted again, and, having relieved my feelings by giving the donkey a slight pommelling, I joined the rest of the party, and we proceeded onwards.

On arriving at the Mahmoudieh Canal, we secured places in one of the boats, and then amused ourselves for an hour by sucking oranges and sugar canes. It was intensely hot, and the smell from the water was any thing but agreeable. There are three boats for passengers, which lashed together are tugged along by two very diminutive steamers; our party was in the last, which is considered the best place.

The Mahmoudieh Canal, constructed by the Pacha to connect Alexandria with the Nile, is about seventy miles in length, very broad, and altogether a very fine specimen of engineering ability, although unfortunately the banks are in some places beginning to fall in. We passed a very pleasant day on it, all things considered, and about ten o'clock at night reached the Nile. Here we found two steamers to take us to Cairo; one of them was for the married people, the other for those in single blessedness. Ours, the bachelors', was the largest, though slowest, and accordingly we started first. It was a splendid night, but as we were all tired, we thought the best thing we could do was to turn in. As there are no beds of any sort, we made as good ones as we could with our clothes on the floor of the cabin, and putting my little parcel under my head, I contrived after some time to sleep very comfortably, though the heat was intense, as at least fifty individuals were crammed into a place fit for about twenty.

21st.—This morning we got up pretty well refreshed, and after having with some difficulty managed to wash myself, for there were but four basins for the whole of us, I went on deck to look about me. The Nile at this part is not at all a fine river, the banks in most places very barren and sandy; there are however now and then fine green and very beautifully wooded spots, which relieve the general tameness of the prospect.

It was not without great trouble that we succeeded in getting any breakfast, for there were only three or four stewards for the whole of us, and we passed a most tedious day, having nothing to do but to lie about the deck, and look at the surrounding objects, which were not very interesting.

About six o'clock in the evening we saw the Pyramids in the distance, and were informed that we were close upon the city of Cairo, which was very welcome information, as we were all heartily tired of our voyage. At eight o'clock the steamer stopped at a small village a mile from Cairo. We landed at once, and, jumping on shore, inquired how we were to get there. Being

informed that there was a carriage waiting, I and my companions thereupon scudded off to it, but found it full; and, as there was no other means of conveyance, we took to that provided for us by nature, and putting our bundles under our arms, and girding up our loins, ran as if the avenger had been behind us, knowing well that if we did not look sharp we should get no lodging for the night. By dint of great exertion, puffing and blowing, we arrived at the gate, and when there found it shut. We knocked, but it was not opened, and we demanded entrance in vain; in the course of five minutes all our passengers came up, and there was a tremendous row; some had walked, and some had ridden in the carriage, which came up last of all, one of the horses having turned restive. After waiting about half-an-hour, an officer came down to the gate, it was opened, and we entered. Here we found donkeys; each mounted one, and we started off in search of an hotel, of which there are three or four in Grand Cairo; but so much in request were they, that it was not till after riding about for a couple of hours that I and my friends managed, at last, to get the only spare room in the Oriental Hotel, a French one, and the finest in the town. Even then it was a miserable apartment we were ushered into; no carpet, and only two very small beds for four of us. However we could not help ourselves, so, having discharged our donkeys, washed and supped, we went early to bed, as we were to rise betimes in the morning to visit the Pyramids. We had ordered donkeys for six, one dragoman or guide, and an extensive hamper of provisions for lunching at the Pyramids, which said hamper was to be carried before another man on his ass.

22d.—After a very hot and uncomfortable night we got up, awakened by the knock of the waiter at the door about six o'clock, dressed in haste, swallowed our breakfast, saw our hamper safe on its way, and then with our dragoman mounted our Arab steeds, i.e. donkeys, of which there were about five hundred at each gate, and rode to the British Hotel to join two of our friends who were to go with us.

They were not quite ready, and till they were so, we amused ourselves by playing with a leopard in a cage in a yard. In about half an hour, however, our friends sullied forth, and we started off in earnest for the Pyramids.

Having thus set my heroes in motion, I shall attempt to describe them in order. First came the dragoman, a little Jewish-looking man, mounted on a small grey donkey, and carrying an enormous staff in his right hand; then came two brother cadets named C— and S—; next myself, and a young Irish merchant named F—; and last of all came another Hibernian, a cadet yeelp L—, and with him a second merchant named Y—; we were none of us twenty-one, and all going to Bengal.

The Pyramids are about ten miles from Cairo, and as we wished to be home early, we determined to go as fast as possible; off we went at a gallop down the streets, much to the annoyance of the donkey drivers, who were entreating us to stop. As for mine, being a short, fat, plethoric individual, he was soon obliged to halt; and nothing more was seen of him till I got back to the hotel.

Mine being a capital steed very soon outstripped the others, and we got on at a rattling pace, much to the danger of our necks. We passed by the palace, met the keeper of the Pacha's harem, went through an open part of Ibrahim Pacha's garden, and then rode two miles through the town, and finally arrived at the Nile which runs through the town, and must be crossed to get to the Pyramids. Here we met with the hamper, and, having sent the dragoman down to the river to get a boat, employed ourselves in buying a stock of oranges. It was intensely hot, and the flies innumerable, a *plaguy* deal too many of them; but in about a quarter of an hour we were informed that the boats were ready,

and accordingly, alighting from our chargers, and leading them down to the most miserable looking vessel possible, we got into it, and after a great deal of difficulty induced our donkeys to enter also. I must say their reluctance to do so betrayed nothing asinine, for it was a very disagreeable style of navigation, as, in consequence of the restlessness of the animals, there was great danger of the boat upsetting every minute, and, to add to our alarm, the dragoman told us that last year a boat had been upset in the same way, and two men and a boy drowned. However, after pulling against a very strong stream for half-an-hour, we managed to reach the opposite side in safety, not before one of the donkeys had nearly tumbled into the water, and all but capsize us. The other side of the river presents a very different appearance to the Cairo one. The instant you get on shore you find yourself in the Desert, and to add to the *vraisemblance* of the scene, at least fifty half-naked Bedouins are standing on the bank waiting to receive travellers, and to conduct them to the Pyramids.

We now remounted, and the dragoman having selected two Arabs for each of us from the crowd, we proceeded onwards; my two attendants were a most rascally looking couple, one a venerable infidel named Ibrahim, and the other a young man called Ali; these two names they continued repeating to me for about an hour, so that if I should forget who were my men I should sing out those two magic words, and my slaves would appear. These respectable individuals must have been pretty well off for wind, as they ran eight miles without stopping by the side of our donkeys.

We had to pass through two or three little villages and several ploughed fields, as the desert, *par-excellence*, does not begin till about two miles from the Pyramids, though there is very little vegetation long before that. Mr. T. Moore might have flown to the Desert if he liked, but if the Arab tents at all resembled their houses, I must say I should have had no wish to accompany him; and the people are as dirty as pigs. On our way we had to cross a small stream about four feet deep in the middle; over this the men took us on their shoulders, as we could not have ridden. Well, after turning and twisting about the country for eight miles, and going almost as fast as we could the whole way, we arrived, completely worn out by fatigue, heat, and sand, at the sign of the Sphinx's Head. Having sat under its shadow, for it throws one of about forty feet square, admired it, and recruited our strength by eating some oranges, we arose and proceeded on foot to the largest Pyramid, it being impossible for the donkeys to carry us here on account of the sand, and the quantity of little hillocks. After a quarter of an hour's detestable walking we reached the Pyramid, with forty centuries looking down upon us and our donkeys. These ancient gentlemen do not look so large at a distance as one would imagine, but, when close under them, then their really enormous height is seen.

Having again rested ourselves, we commenced the ascent of the Pyramid, assisted by three men each, two to drag us up, and one to shove behind. It was fearful work, some of the stones being four or five feet high, none under three, and very slippery; half way we stopped for ten minutes completely done up. From this we got to the top after herculean struggles, I being first on the summit of these giant steps, and we blessed our stars when we were safely landed at the top of the Stairs of Size; but hardly had we arrived there when those rascally Bedouins began bothering us for Bucksheesh, and sporting the little English they knew, which consisted of "Englishmen bery good," "Bucksheesh bery good," "Englishmen give Bucksheesh." We were however proof to their flattery, and, after having admired the prospect, which is extensive and strange, descended. And oh, that descent! it was a perpetual jump from top to bottom, and, though you may beg and pray the

Arabs to stop, they won't do it,—down you go, shaking and trembling all over from exhaustion. In fact we were all so completely *hors-de-combat* when we did at last reach the bottom, that we threw ourselves at full length on the sand, and there remained immoveable for at least a quarter of an hour.

At the end of that time we began to revive, and proceeded forthwith to penetrate to the interior of the Pyramid, which was worse, we found, than climbing to the top. With the assistance of two or three wax candles, and three men each, we contrived, after crawling and walking half-choked with dust and heat, and continual bumps of the caput, (so that if Mr. Combe or other phrenologists had examined us, they would have found new bumps which, I think, would have astonished them not a little,) to reach a lofty room, where we rested and recovered a little breath. Quite satisfied with what we had seen, or rather felt, we inquired if there was anything else. In reply, they pointed to a little hole about the size of a crown-piece, and told us if we wished to see more they would conduct us through this small passage. To this polite offer we gave a decided negative, not having any desire to crawl on our stomachs for even a quarter of an hour, and spoil our only pair of unwhisperables. We, therefore, returned with joy and gladness of heart, and never were any of us so much delighted as when, having left darkness and dust behind us, we emerged into the open air.

Having thus satisfied our curiosity, and seen all that was to be seen, we thought the next best thing to do was to satisfy our hunger, as we all began to feel a little peckish; so after paying our guides, which, notwithstanding the cravings of nature, was not accomplished in less than half an hour, as they fought and quarrelled about the money like the Kilkenny cats, we sat down in the shade of a large flat stone at the bottom of the Pyramid, opened our hamper, and proceeded to discuss the *matériel*, which consisted of a cold leg of lamb, two tongues, couple of cold fowls, bread and cheese, washed down with twelve bottles *bière*, three *vin ordinaire*, two of champagne (gooseberry I am afraid); and for dessert, oranges, dates, &c. &c.

(To be continued.)

THE WANDERER'S RECEPTION.

CHAPTER IV.

THE afternoon was far advanced before Mary had the satisfaction of seeing her cousin return. She had been watching in the porch for hours, when she caught sight of the horse's head, and, throwing aside the work which her aunt had set her, she ran as fast as she could towards it. She had quite believed that the old man would return that night. When she saw only one figure, she felt quite disappointed, and seated herself on a stone before she reached the cart; presently James called to her, and asked her if she did not want some news.

"I should like to hear how he is, although he will not come back to me. You ought to have waited for him, James."

"It was impossible to do that, Mary, and it is thoughtless of you to fancy I could. You know my mother would have been very uneasy if I had. You had better jump into the cart, and when I get home I will tell you all I can about old Robert."

Mary was obliged to consent to this, but was very impatient to get back, to hear what he had to say. "I am sure, James, France might go faster; do make him."

"The horse has had a long day of it, Mary; and I am sure, poor thing! he must be tired; I know I am, and sadly want my supper."

The little girl's impatience, instead of making them

(1) Continued from p. 12.

go quicker, made the distance appear longer; and by the time she was lifted out, she had foolishly allowed herself to become as ill-tempered as she had been in the morning, and fancied that her cousin had been very cross to her. As he took her from the cart he begged she would run to his mother, to get him something to eat. Mary did not like to refuse, for she really was very fond of him, and ran to do as he wished; but, when she saw him quite intent upon his cold meat and bread, she was much annoyed; and fancied he must be very unkind not to tell her what she so much wished to hear. She watched each mouthful, until James begged her to go away, and let him eat in peace. More irritated than before, she called Trust, who had been sitting close to the table, begging for his share. The dog lingered, as if appealing to his mistress's good nature, but she had none to bestow; and leaving even her favourite, she ran into the garden to look for the work which she had left there; but she hunted in vain; no handkerchief could she find. In great alarm, as it was one she was hemming for Miss Stanmore, she hunted in every direction; at last she caught sight of it on a hedge, in a corner of the garden. She ran to take it off; but just as she had carefully extricated it from the last branch, a gust of wind again blew it away, and this time, unfortunately, it blew it into the well. In great trouble, she screamed to her aunt, who was not very far off.

"We must fetch James," said Martha; "perhaps he can get it with a stick; run and ask him to come."

But Mary felt that she should be ashamed to ask a favour of him, and stood looking at the water. Her aunt desired her to run directly, or the handkerchief would get heavy when wet.

Mary could not again refuse; with much confusion, she went to James, and asked his assistance. The supper that she fancied took his whole attention, was instantly neglected; and, with Trust, he ran to his mother; but the water was low, and no long stick was at hand.

"Never mind, Mary," said James to the little girl, who had begun to cry, "we will get it; come here, Trust!"

He showed the handkerchief to the dog, who seemed quite to understand what he was to do; he put the animal into one of the buckets, and carefully lowered him. Mary was now more alarmed for her favourite than for the work; but, when she saw him snap at it, and look up at them to draw him up, she was quite reassured. With a bound Trust jumped out, and shaking the drops of water off his head, he laid his prize safe at his mistress's feet. Mary now cried from shame and repentance at having been so unjust to James, who was so ready to assist her, though still tired and hungry. She was soon forgiven, and was so anxious to show her regret that she hastened with him into the kitchen, and would have given him all the provisions in the house, if he would have submitted; at the same time, she constantly rewarded Trust with morsels from James's plate.

At last, both had finished, and her aunt and uncle coming in, James gave the account of his day's adventures.

He had, with some difficulty, found the cottage whither the letter directed them. The young woman was so ill that it was thought she could scarcely live through the night; she knew her father, and expressed the greatest pleasure at seeing him. Her husband, and a little child not quite a year old, were with her. This was as much as James could say, as he had not liked to intrude on them longer than he could help. He thought, when the state the daughter was in, that her father would soon be able to return; and he remarked, that they had better get the cottage ready. Robert had commissioned James to get some furniture in the town; and the next day Mary was very busy helping Martha to clean the cottage. The things soon arrived, and by the evening the little dwelling was in good order, although it still looked desolate. Mary had begged to be allowed to stay there

as late as possible, in case the traveller should return, and go there instead of to the farm. She was sitting at the window with her work, although her eyes were oftener turned to the road that led to the town. At last her patience was rewarded by the sight of her friend, close to the gate. He held in his arms what seemed to her a bundle, but he evidently took great care of it. Mary was soon at his side, but he seemed much overcome and exhausted; and, when they reached the parlour, he placed his treasure in Mary's arms. She felt that it was something heavy; and, on removing the large shawl that had covered it, found a poor baby, fast asleep—she could scarcely contain her surprise, but Robert's grief had saddened the child; and, carefully placing the little motherless thing in her lap, she watched its placid slumbers.

Old Robert had rested his head on his hand at the table, but, suddenly raising his eyes, he saw the two children; and, drawing near to them, he told Mary that the baby was his grandchild; that he should keep it with him; and that if her aunt would allow her, Mary should live with them, and take care of it, if she would try to be steady, and good enough to take so important a charge.

"I will do my very best; indeed, I shall love it very much;" and her arms clasped the infant tighter as she spoke. It opened its bright eyes—smiled contentedly, as if answering her affection—rested its little head upon her bosom, and was soon fast asleep again.

"You shall begin your duties to-night, Mary; and before it is quite dark, take my precious little one to your aunt's. I am sure she will let it stay with her to-night; to-morrow we shall get a cradle, and you can then bring it here."

"But will you not come home with me? You have had no supper, and my aunt would like to see you."

"No, I cannot come to-night; take care of my child; and to-morrow I shall be better able to talk to Martha."

Mary longed to ask several questions, but she saw the old man would rather be alone; and, carefully replacing the baby's shawl, she tenderly raised it, and as gently as she could carried it to the farm.

Her arrival with her burden caused some surprise, but she had not courage to tell them that she hoped to have the constant care of the baby; she was intent on doing her duty towards it; and, when she had begged James to carry some supper, and the small box that the old man had left there the day before, to the cottage, she begged for some night-clothes of her youngest cousin, and soon undressed the little one. Her handiness and steady care quite astonished her aunt; but Mary could not notice anything but her charge. She put it into her own little bed, told her aunt all that she knew about the old man, and was soon by its side. For the first time in her life Mary's mind was too much occupied to sleep; she felt the importance of her new duties, and began to feel that she should have some pain at leaving her present home. The events of the last few days had seemed to create new ideas; she saw that she had no right to consult and indulge merely her own wishes; and, although still a child, she determined to act differently for the future, praying earnestly for strength and direction to persevere and learn what she ought to do. But she was not accustomed to be troubled with anxiety, and in the midst of resolutions and intentions she fell fast asleep. The cry of the baby awoke Mary at an early hour, and she was soon comforting it by all the means in her power. It was not difficult to soothe the child, who seemed very good tempered. Mary washed and dressed it, as she had seen her aunt attend to her baby; and, when she thought breakfast was ready, carried it to Martha, to know what she was to give it. Her aunt gladly showed her how to prepare its food, and praised her for her expertness.

Soon after breakfast old Robert came to the farm, and expressed his wish that Mary should come and live with him. He explained to Martha how his daughter's

silence had been occasioned by illness. The sea-voyage had disagreed with her health, and the news of her mother's death, in the weak and delicate state in which she was, caused a long and fearful malady. She was admitted into an hospital, and for some time her life was despaired of. Her husband had allowed her to visit England, and stay as long as she liked amongst her friends. The money he had given her, and what she had received from her father since her arrival, was expended during her illness: and, when she was able to exert herself, she found she had not the means to take herself and little girl to her desired destination. Unwilling to be a burden on any one, she determined to delay her journey, hoping she might be able to collect a sufficient sum for the purpose, and foolishly abstained from writing until she could send a more cheerful account of herself. She had herself and child to support by her needle, and it was long before she could get employment. In the mean time, her husband had prospered in Canada, and determined to join her in England. When she left him he found how little he had valued her. He had never been unkind to her, but her lamentations about her family had annoyed him, and he had neglected her from the idea that she cared more for them than for him; but, when absent, all his former tenderness seemed to have returned, and he was impatient to be again with her. She had written to him and told him of her illness. He was surprised to find all her letters dated "Southampton," but she did not tell him the reason, and, when he found her still there, it was explained for the first time. Illness had again attacked her, and now there seemed little hope, but her joy at finding her husband so kind and affectionate made her rally for a time; and they intended, directly she was a little stronger, to set off with their child to the village whither the old man's former letter had directed them. But the improvement was deceitful; she again relapsed; her father was sent for, and arrived only in time to bless her.

Her husband decided upon returning to Canada, but thought that his child would be better taken care of if left with its grandfather. Robert willingly undertook the charge, and now begged Mary's aunt to grant his request respecting her niece. For a long time she objected, from the fear that Mary was too young, but when he reminded her that he should be near to watch over them both,—that she herself was within a few minutes' walk of the cottage,—and that Mary could obtain assistance from her, it was arranged that she should be allowed to go, but that she should for a time have Martha's instruction how to take care of the child, and prepare its food. Mary was made quite happy by this intelligence, and, when she put little Beasy to sleep for the first time in her cradle, at her new home, she thought no one on earth could feel happier than she did; she longed to show her new charge to Miss Stanmore, but was quite puzzled to know how to manage it. She could not leave the baby, and the distance was too great for her to carry it; she wished to send Ellen word that she might come and see her grandfather, as she had begged leave to call him. She had already talked to him about the young lady, and, as she expected, he wished to see her. The difficulty was obviated by Robert's telling Mary one morning that he wanted to visit the clergyman whose parsonage was on the road to the Hall, that she could go with him there, and he would carry the child as far as he went, and that she would then have no difficulty in taking it the rest of the way. He promised also to wait for her, and relieve her on the road home. This plan quite pleased Mary, as she would then be able to show the child to the clergyman's wife, who was a kind friend to her. She was soon ready, and attended by Trust, who seemed quite as pleased with his new abode as his mistress was, they set off for the village.

THE BOY'S OWN LIBRARY.¹

THIS library, which is now completed, consists of four volumes, one for each season. Their external and internal decorations are of a very attractive character, making them a most desirable acquisition for any boy; while the matter which they contain is greatly superior to the ordinary run of books intended for juvenile reading. Here is no infantile lispings—no elaborate childishness of thought and expression; but good sound substantial information regarding the various natural objects—the pursuits and amusements, peculiar to each season, with anecdotes illustrative of each—told in a manly, and yet genial style—not without a slight touch of poetic feeling. Our young friends are indebted to Mr. Miller for many an evening hour's pleasant and profitable relaxation.

As a specimen of the author's style must be more satisfactory than any general criticism, we subjoin an interesting little sketch taken from the Winter volume, the subject of which reads as if not altogether new to us.

THOUGH it happened many years ago, that old carrier will never forget the dreadful snow-storm which in one night covered the valley to a frightful depth, and was driven by the wind against the long line of hills, where it gathered drift upon drift, in many an up-piled range, until it looked as if a new upland had arisen, long, high, and deep,—the gathering together of many a wind-whirled wreath of snow. It was the last Saturday night before Christmas Day, when he was returning home on his journey from the distant market town; and, as he quitted the last few houses, and exchanged a "good night" with such of the inhabitants as he knew, many looked up to the sky, and remarked that there would be a heavy fall of snow before morning, for not a star was visible in the sky, nor could you tell where the moon was, although it was at the full. He had with him in the cart a young girl, about fourteen years of age; who was going home to spend the Christmas with her widowed mother. She knew when she reached the carrier's house her little brother would be there to meet her; and she thought how easily they would carry the light box between them, and how soon they would walk over the two miles of ground which would bring them to her mother's cottage, which stood at the bottom of the steep hilly lanes. The boy was at the carrier's house long before she arrived, and many a wistful glance did he cast at the door, as it was opened and shut every now and then by the woman, who began to feel uneasy about her husband, as it was past the time at which he usually arrived. She had several times remarked, "oh, what a night!" as she resumed her seat beside the fire, facing the boy: he made no answer, but sat watching the snow flakes which had been drifted in by the eddying wind, as they melted one by one upon the warm and cheerful hearth.

"You will never be able to walk home to-night," said the carrier's wife; "you will both have to stay here until morning; we can manage to make shift somewhere."

The boy looked at her a few moments in silence, then said, "Not go home to-night! Mother told me she should sit up for us, if it was ever so late before we came."

Just then a loud gust of wind struck the side of the house as if it would level it to the ground, and blew the door wide open, and in a few moments the whole floor was white over with snow.

The boy rose from his seat to latch the door more securely; and, ere he sat down, said, "I should like to go and meet them, if you thought it wouldn't be far: Betty has never been home but once since Whitewide, and that was only one day at the feast."

But the woman dissuaded him from going, and told

(1) The Boy's own Library. Winter Book. By Thomas Miller, Chapman and Hall. 1847.

him that Etty would be warm enough amidst the straw at the bottom of the tilted cart. This seemed to pacify the boy a little, and he ate a mouthful or two of the bread and cheese which she had cut him, then laid the rest upon the table. At another time he would have finished it all in about five minutes, but now he was uneasy through thinking about his sister and mother. Meantime, the carrier had reached the high hilly road which led in a direct line to his own door. He had persuaded his youthful passenger to get out, and walk beside him, without telling her why he did so; but such was the force of the wind that he expected every moment his cart would be blown over, and then he thought that some of the heavy boxes or hampers might fall upon her and injure her; so he held the horse and led it with one hand, while with the other he took hold of the little girl, and thus they measured their slow steps through the keen, cutting wind, and heavy falling snow. The candle had long stood at the little end window of the house, and, as the carrier's eye first caught it in the distance, he said, "See, there it is!" for, as it threw out its rays upon the night, it seemed like a bright burning star amid the din and desolation of that wintry landscape. The careful housewife had placed a pair of shoes and a coat before the fire, and the kettle had so long sung to itself upon the hob, that the boy wondered a dozen times to himself whether or not it would give over. None but an ear accustomed to the lightest change of sound would have heard the noise of those muffled wheels, as they came along slowly and heavily through the snow; and when she jumped up, and rushed to the door, exclaiming, "Here they come!" the boy also rose up, and listening with his head aside, said, "I don't hear 'em," but when he got to the door, he could see a dark mass of something moving towards him, through the drifted snow. The little girl was first carefully attended to, and seated in the warmest place beside the fire, and then the carrier's wife helped her husband to bring in the boxes and parcels, which were placed upon the floor: the storm rushing in with such force all the time, that it made the bright toasting forks, and ladles, and bridles, and bits, and stirrups, which hung up against the opposite wall, jingle one against the other. A few words had passed between the carrier and his wife outside the door, and he came in as if to warm his hands, while his real intention was to persuade the children to remain all night: but the girl's answer was so earnest, and so full of feeling, when she said "that she knew how unhappy her mother would be, and as for herself, she should not be able to sleep a moment," that it became painful to press her further, for she had a hundred reasons for going, and not one for remaining behind. The hardy boy also mustered up courage to speak, and said, that "they were not made of salt, and so could not melt away; and as for the road, that was easy to find, and the box would shove away the snow as they carried it between them."

"Well," said the carrier, shrugging up his shoulders, "I will not compel you to stay; and, since you are so bent upon going, I will take you to the end of Fosdyke Lane before I unharness my horses; it will save you a mile."

They both kindly entreated of him not to do so; he would have to come back by himself, they said, and they should soon be there; but on this point he was resolute, and, buttoning up his coat again, which he had unbuttoned for a few moments, he went outside, wiped the snow from off the horses, put the children with the little box inside the cart, saying to his wife as he started, "I shall not be long," and again resumed his journey.

The high range of hills along which he now passed was called the cliff, or scar: if you stood on the steep scarp on a clear day, and looked down into the valley, you saw ledge below ledge, which told you how the snowdrifts had ebbed, and then remained stationary, then rolled away again, and again stood still,

until it once more emptied its waters somewhere out at the mouth of that vast valley, then paused, until a new table-land was formed; for so was the whole slope from the summit of the cliff left, in wavy ridges and steep level embankments, for miles and miles along; and now over all these the snow had drifted from that wide unsheltered valley, and still kept gathering in vast heaps everywhere, saving upon the road, where our travellers journeyed; for from the highway it was blown onward to the foot of other and more distant hills.

At the end of the lane, the carrier left his passengers, bidding them be sure to take care and keep on in a direct course; for he knew that they were scarcely a mile from their mother's cottage: and after he had gone, with the snow beating in their faces, the children went cheerfully their way, carrying the little box between them. As the wind blew direct from the village to which they were journeying, they heard the church clock strike eleven, and the boy said, "In another half-hour we shall see mother."

The road was all down-hill, and as the snow added much to the lightness of the night, they found no other difficulty than in its depth, for the first quarter of a mile, so went on keeping the centre of the road. As they proceeded further, to where the hilly way dipped down more abruptly, they remarked to each other that the hedges on either hand were more than half hidden, and they went onward and onward until the snow covered them midway, and they found that, light as the box was, holding it up so high made it very heavy; and when the tops of the hedges were no longer visible, and they could only see the dark outline of some tree, whose stem was already buried, it was then that they paused, and looked at one another—and heaving a deep sigh, Etty said, "We shall never get home to night."

The boy stood upon the box, and looking over the scene, said, "I can see the three elms that hang over mother's cottage, but Farmer Ingram's five barred gate, which I know we are close upon, is covered with snow—and that is just as high as my head, for I measured myself there last summer, when I was tending the corn. Dear Etty, what will mother do for us!"

But Etty was seated upon the box, with her face buried within her hands, sobbing aloud. The boy sat behind his sister, and taking hold of her hands, said, "Don't cry so, Etty; let us say our prayers—you know mother told us, that God could do every thing."

Etty said she would not cry, and rising up, placed her hand upon his shoulder, and mounting upon the box, exclaimed, "I can see lights moving about where the elm trees stand; oh! God! perhaps poor mother has set out to meet us, and is lost, and they are seeking for her in the snow." And as she spoke, the picture rose so vividly before her imagination, as in fancy she saw her dear widowed mother dragged out from under the deep snow-drift, pale and cold, and stiff, and dead, that she unconsciously uttered a loud shriek, and fell as if lifeless among the high piled drift. The brave little brother forgot all about his own safety, while he tried to restore his sister, and as he knelt over her, and took off his cap to make a pillow for her head, while the tears followed each other in rapid succession down his hardy cheeks, his heart sunk within him; for although he called, "Etty, Etty!" in every endearing and plaintive tone, she made no answer; and when he kissed her he found her lips as cold as death; and as he raised her arm for a moment, it again dropped by her side, motionless, resting just where it fell.

His first act was to jump up, and plunge headlong into the snow in the direction of home, to fetch his mother. But a few yards before him the road went down sheer and deep; it was the steepest part of that hilly lane; and after struggling over head in the snow for a minute or two, he found his way back to his unconscious sister, and sitting down beside her, wrung his hands and wept aloud. But even in that bleak and bitter night, God's good angels were abroad, and walk-

ing the earth; and it might be that the prayers of those children had drawn to the spot one of the invisible messengers; for, if prayer can reach up to the gates of heaven, who can tell how many "ministering spirits" are ever waiting there to do the Almighty's bidding? And, perhaps, one of those stood in the highway, unseen by the carrier, and prevented his horses from moving further, even as an angel stopped the ass on which Balaam rode. For thrice did the horses halt within a brief space of time; and as the carrier's heart had for some time smote him for leaving the children at the end of the lane, to find their way home by themselves, he resolved to turn back: he did so, and the horses seemed again to move along cheerfully.

"Something told me," said the old carrier after, "that the children were in danger, and the instant the horses went so freely along of their own accord, I knew it was so; and, from the moment I started to go back, my heart felt lighter, and I seemed to breathe more freely—as for the snow and wind I scarcely felt either."

The drift was settling fast down, and covering over the two children; for deep heart-breaking sorrow had so benumbed every other feeling in the poor boy, that as he sat holding the cold, lifeless hand of his sister within his own, he felt not the snow gathering over him—felt not the big white flakes as they settled down upon his naked head, melting, at first, one by one, until a few remained, and others came faster and faster; he saw them not,—he felt them not,—as he bent over the form of his dear sister; even his sobbing became less audible, and a dull, drowsy feeling was unconsciously creeping over him,—that cold sleep which many a benighted one has sunk under, never more to wake again until the last trumpet sounds, and the grave gives up its hidden families of the dead. A few more of those low, unconscious sobs, and all would have been over, the snow would have been "their winding-sheet," when, hark! there came a sound as if driven back through the wind;—it approached nearer; he heard the creaking of wheels, then the jingling of harness;—that sound had saved them both from death: he sprang up, as it were unaware; he raised his sister in his arms, he parted the long hair from her face, he strained his eyes, and looked forward; in a moment he was all eyes, all ears; then the wind came with another long, deep howl; it passed on, and the same sounds were heard again; he caught the "gee-whoop" of the carrier, he could not be far off, there could not be many yards between them; he shouted and received an answer: both cart and horse were fast, and he heard the heavy plod, plod of the carrier as he came along by himself, for his cart and horses could make no further progress along that deep, hilly, and snow-covered lane. The kind hearted old carrier took the girl in his arms, as if she had been a mere child, and placed her upon the straw at the bottom of the cart: whilst he was endeavouring to restore her, his wife came up, for she also had begun to feel uneasy, and said, that had she met her husband, she was determined to persuade him to turn back, and see whether the children had arrived in safety at home. They returned to the carrier's house, and Etty was soon in a warm, sound sleep; for she felt easier after she had knelt down and prayed for her mother. Nor had she been asleep more than an hour, when a loud knocking was heard at the door; for a man had come all the way round by the low road, which ran along the middle of the valley, and was five or six miles further than the nearest way, which was now impassable. All this way had that kind hearted man come, that he might gather tidings of the safety of the children, for their mother had fainted away many times during that awful night; and, although kind neighbours attended upon her, yet they could afford her no comfort; and it was not until this poor labourer volunteered to go and see what had befallen them, that she could be at all pacified. The carrier got up, and persuaded him to take one of the best horses in his stable, and make all the speed he could

back, by that long roundabout low road, where the snow had not gathered in deep drifts, and to tell the fond mother that both her children were safe. But nothing could dissuade the brave boy from accompanying him: so he was at last allowed to ride behind, for he said, "When my mother sees me, she will know that Etty is safe, or I should never leave her."

They reached home in about two hours, in safety, and brought comfort to the sad heart of that fond and disconsolate mother. The little box was not found until after many days, when the snow had melted away; and there are those yet living who well remember that night. Etty heard the village bells ringing for church, as, accompanied by the honest carrier, she entered her home. What her feelings were when she remembered how from that church-tower, she heard the clock strike eleven on the previous night, I cannot tell you; but her eyes were filled with tears, as she raised her sweet face, and looked at the old carrier, while with her finger she pointed to the village church.

RAMBLES IN BELGIUM.

NO. II.

FROM Ostend to Bruges the distance is but short. I was particularly reminded of the fertility of the soil by the rich appearance the highly cultivated fields exhibited, on either side of the railroad. The Flemings everywhere gave me the idea of being a very industrious race; men, women, and children, were all engaged in gathering in the products of nature. Nothing, however, can exceed the monotony of the country; no swelling undulations, no hills, and but few trees, and those disposed in very formal lines. It was a positive relief to my feelings, when the trumpet of the conductor sounded to tell us we were at our journey's end,—quaint old Bruges.

The aspect of the city is very striking: the houses, with their very picturesque appearance, full of gable ends, carvings, fantastic sculptured ornaments, &c.; the squares with their municipal halls, the broad streets, the linden avenues, the canals intersecting the houses in all directions, afford the stranger a pleasant contrast from the town of Ostend. My first visit was to the church of Nôtre Dame, in which I saw a beautiful specimen of the carved wood-work for which Flanders was of old so celebrated. It is made of oak, and is of the grandest dimensions: in the confessionals are other not less interesting examples of this art. The caryatides are especially fine: in almost every church I visited in Belgium, I was astonished by the beauty of these carvings, which so profusely adorn the altars, side aisles, &c. In a side chapel are the monuments of Charles the Bold, and the Empress Mary, his daughter.

These tombs are composed of a very dark stone, having whole length figures on them of the illustrious Duke, and the last native sovereign of Flanders, designed in gilt copper, and surrounded by coats of arms, medallions, lozenges, and shields, recording the possessions of the unfortunate Mary. I would recommend no tourist, visiting Bruges, to omit a pilgrimage to these interesting memorials. A painting of the Crucifixion, by Porbus, hangs near, and is a first-rate specimen of the master.

From Nôtre Dame I went to Les Halles, or the Hôtel de Ville, where I had been advised to ascend the tower, to see the mechanism which sets in motion the sweetest and most musical chimes I had ever heard. Not feeling well, and the day being unusually warm, I contented

myself with listening in the coolest spot I could select. It is not always that a peal of bells, however skilfully managed, falls upon the ear with a rich and harmonious sound; but these chimes are, in every sense of the word, most musical. They form truly a "concourse of sweet sounds."

There is a house in the Rue St. Amand, which is said to have been the dwelling-place of King Charles the Second, when he took refuge in this country from the pursuit of the baffled Puritans. It is inhabited by a shopkeeper, who makes clothes for the good burghers. The Hospital of St. John detained me for a longer time than I had at all anticipated from the aspect of its exterior, or the first glance of its internal arrangements. The pictures painted by Hemling are very beautiful; a small reliquary, painted by him, and representing the legend of St. Ursula on its various compartments, is remarkable for the minute finish of its details, and the careful way in which the subject is treated. At the gallery of the Museum, near the *Quai du Miroir*, I did not linger long; for I began to weary of the incessant repetition of the same artists. I looked, but all in vain, in this collection for a first-rate Rubens. A gentleman who was taking a sort of perambulating sketch of a small work of art near the entrance, assured me that the entire collection was "superbe." I could not realise this magniloquent expression. For some reason, which I could not discover, admittance was denied to the Church of St. Sauveur.

At night, the city was still and quiet, lit by a full moon shining with silvery lustre on tower, canal, tree, and solitary straggler. Walking through the principal streets, I was led to fancy myself in Venice. Something of desolation seemed to hover around and about, the quietude of the streets was so excessive: the places where rich merchants and active traders formerly held long debates, were all silent; the canals, with their dreamy-looking boats, and the very sombre and antique character of the houses on their banks, conspired to liken themselves to the city of the sea. There was a festival going on in one of the gardens, near the entrance of the city, on the Ghent side, and a chorus of female voices very nicely harmonised, accorded with the true spirit of the scene. The tones were at first low and subdued, then gradually rising, they attained a triumphant *tempo*, which, finally, resolved itself into an *adagio*, soft and expressive.

I was tempted to conceive the party to consist of some patriotic ladies, who were narrating, in verse, the history of their native place, and its glories, finishing the chant with a wail over its fall and decline.

The *Fleur du Blé*, is an excellent inn; the greatest civility, and moderate demands, are to be met with in its comfortable walls: though past the usual hour of shutting the doors for the night, there was no grumbling, no extra fee demanded or required, as is often the case in other towns. Before taking the early morning train to Ghent, there was time for an inspection of the *Palais de Justice*: a chimney-piece in the apartment where the magistrates transact their official business, is so well known, and so celebrated for its richness and beauty, that, not to see it, would be an act of Vandalism on the part of every traveller in Belgium. It consists of four principal niches, surrounded with a vast quantity of armorial designs and embellishments.

In the niches are statues of Charles the Fifth, the Emperor Maximilian, Mary of Burgundy, and Mar-

garet of York, all executed with great fidelity and finish. There is an appearance in these statues of an exact likeness to the individuals they are intended to represent; a truthfulness which it is impossible to define, yet which must be felt by the spectator.

To those who have neither had the leisure nor appliances for viewing the original, an inspection of the water-colour drawings of Mr. Haghe will afford a very good idea of this masterpiece of oak carving. It bears the date of the early part of the sixteenth century; and it is to be hoped that the spirit which is abroad for the conservation of the remains of our ancestors' handiworks will extend itself hitherward, and preserve this very remarkable specimen of art for many ages yet to come.

The transit from Bruges to Ghent did not afford any very striking object; the country is still flat and uninteresting, except to eyes agricultural, who, by the way, are not the most common that peep at "fresh fields and pastures now."

THE IRON MANUFACTURE.

If a thoughtful man were to sit down in the midst of a populous European city, and inquire from the passer-by the history of the common objects which every hour present themselves in the crowded streets, the result of his questionings might be twofold. He would, in the first place, be surprised at the immense amount of ignorance respecting the most ordinary matters, which the majority of men quietly submit to, as if it were the destiny of human nature, or a luxurious privilege of the understanding. To his queries about the animals in the thoroughfares, the shrubs and trees in the squares, the materials of the houses, and the usual vehicles in the streets, few answers of the explanatory kind would be given; and he might be fortunate to escape the contempt of some, and the pity of others, for troubling his head with such trifles. Nor might he succeed better were his inquiries directed to the more important subjects of home and foreign commerce, arts, science, education, and the like. He would in vain urge that these very things form the elements and signs of civilisation, and that granite pavements, iron bridges, and railroads, are sure indices of the national character, and symbols of progress in civilization.

In the next place, our supposed inquirer would feel that the history of common things—their origin, the various stages through which they have passed, and their present influence on society—is essential to a proper understanding of the history of man himself. Not a manufacture can exist, not an art be practised, nor a single science studied, without affecting the condition of vast masses of mankind, and tending to form the present and future character of mighty nations. So closely are all things linked together, that to understand the great we must study the small; and thus the common things of our daily life have a strong claim upon our attention, quite independent of the practical and commercial results secured by such knowledge.

Amongst the common facts of this age we must rank the manufacture of iron, a substance which meets us everywhere, in forms and with uses no more imagined by our ancestors, than the power of steam, or the wonderful whisper of the electric telegraph. We see this production in the cottage of the poorest labourer, who does not condescend to count it amongst his *valuable*s; our most magnificent erections, such as the Menai bridge, bear witness to its adaptations: iron has even been made to swim, and large ships of this metal cut the sea; whilst in crowded ports the iron warehouse gives additional security to the merchant. Churches no longer call upon the quarries of Caen for an imperishable

material, but draw their walls and roofs from the mine; whilst multiplying railroads, and a thousand steam engines, call upon the earth for further offerings of the precious ore. Amidst such a display of iron-power, we cannot but ask, Whence does the all-conquering metal come? through what processes does it pass before rising in such majesty in our dock-yards, or performing its hundred humble offices in our dwellings?

Nothing presents us with a stronger proof of the triumph of the human arm and head than a piece of iron, which he who rightly understands will regard as a most striking fact in the history of civilization. The mass of that noble road which spans the Menai straits, or the elegant suspension bridge, was once a heap of hard dull earth. The hand of man has drawn from the clay-like heap, steam frigates and national roads. To trace the steps by which iron gradually passes from the ore to its ornamental and useful shapes, is the object of the present article, which it is hoped will give to every reader a brief but clear history of the advance of iron from the ore to the metallic state. It is needless to speculate on the circumstances by which men first discovered the mode of extracting iron from the earth; it is better to rest content with the fact that the art of working this valuable metal was known to the antediluvian world, for we read of Tubal-Cain that he was "an instructor of every artificer in brass and iron." The ancient fables of the pagans ascribe the art to the gods, for Vulcan, whom they represent as the first iron-worker, was a son of Jove. The plain inference is, that the origin of the iron manufacture cannot be indicated by human historians, being hidden beneath the shadows of those ages when Tubal-Cain may have taught the sons of Lamech the mysteries of metallurgy.

The art, once acquired, was never lost, but descended through ancient and middle ages to modern times, in which it has made such surpassing advances, though yet very far from perfection.

The manufacture is of course confined to the more civilized regions of the globe, where alone the numerous processes required for its development can be fully carried out. As England is now the principal seat of this most useful art, our remarks will have a special reference to the system of *iron-making* pursued by British workmen. Iron is truly a *creation*, and the expression "*making*" is no idle, inconsiderate, or fanciful phrase, as it might sound, if applied to such metals as silver, gold, or quicksilver, which are but *taken out* of the earth, and not made.

Let us take up a piece of the iron earth, called ore, and, with this dull rusty looking lump in our hands, examine a polished sabre, or a needle, or gaze upon an iron steam frigate floating in her pride of power at Spithead. What resemblance can be traced between such results of skill, and the earth in our hands? The eye can see no connexion between such diverse objects, nor can the hand use that lump of matter in its *present state* to promote any one end of human industry. But experience here steps in, and conducts us through all the processes which show how the magnificent Menai suspension bridge is created from a mass of shapeloss earth. What then is iron? It is found either as a *clay-iron ore*, called *argillaceous*, or as a *limestone-iron ore*, called *calcareous*: in the former the mineral is united to a clayey body, in the latter to limestone masses; the former of which is the most abundant ore in England, and is classed as an *argillaceous carbonate of iron*. These terms simply imply that the mineral is united to clay, and also combined with another widely diffused substance called carbonic acid. The mineral is often found united with *sulphur*, and is then termed a *sulphuret of iron*, which has a more metallic appearance than the other ores, and is commonly called *iron pyrites*.¹

It may be necessary here to inform the reader, that when a mineral is alloyed with some combustible substance not acidulated, such as sulphur, or carbon, the compound is distinguished by the termination *et* being added to the name of such a combustible; thus iron united with carbon is called carburet of iron (steel), or with sulphur a sulphuret of iron. When the termination ends in *ate*, as sulphate of iron, the reader must remember that the sulphur or carbon is *strongly* impregnated with oxygen; the endings in *ite* import a *less* degree of oxygen in the compound. The word *oxide* expresses the union of a metal with oxygen: when the latter substance acts upon unprotected iron and *rusts* it, this rust is called oxide of iron. These explanations may prevent any obscurity should the use of such terms as sulphurets, carbonates, oxides, &c. be necessary in these pages.

The reader may now infer that iron, in its mineral state, is united to various foreign substances, such as sulphur, carbon, clay, lime, flint, and even arsenic, from which it must be freed before it can be made an obedient servant to man. These alloys are, however, frequently found useful in various arts, and produce valuable materials for the purposes of man. Thus the oxides of iron are used in calico-printing establishments; *sulphate* of iron is the vitriol employed to colour cloths, and the union of the two last-mentioned alloys with prussic acid (hydrocyanic acid) produces prussian-blue. Blacklead is nothing but a mixture of carbon and iron; and the red chalk used for pencils, is also an oxide of the same material, besides which there are various amalgamations not necessary to be particularized in this article.

The reader doubtless has sometimes heard of *meteoric* iron, and may inquire whether it is one of the alloys just noticed. This iron is certainly an alloy, but not a production from any mine in *this* world, being formed either in the air by some mysterious electrical agency, or projected from the moon, as some imagine. Large masses of this mineral have fallen from the atmosphere at various times, and are found to consist of iron, nickel, silica (flint), sulphur, and lime. They are often called aerolites (air stones), and are discovered in all parts of the earth in blocks of considerable magnitude. The Esquimaux possess knives formed from this extramundane metal, which the investigations of science are unable to trace to its home. If these mineral fragments are shattered portions of some distant planet, which being projected into space are drawn within the circle of the earth's attraction, we have a singular fact presented to our notice: a sort of connexion is thus established between us and some remote orb, from which we receive these exiled fragments. That a portion of another world should be found in the shape of a tool amongst the half barbarous tribes of this earth, not only excites wonder, but must suggest many curious speculations on the original homes of the aerolites which have descended upon all quarters of the globe. Probably the sacred stones worshipped by the pagans were but aerolites, which seemed to the ignorance of heathen priests and people the representatives of some power above.

These singular bodies may be generated in the atmosphere, under peculiar combinations of heat and gaseous matter, upon which supposition the term *meteoric* has been applied to the numerous masses recorded to have fallen upon the earth. Hadley observed the descent of such a body, and estimated its motion at 350 miles a minute, and its height at seventy-two miles, at which elevation it blazed with an intense light, although far above the limits usually assigned to our atmosphere. How do these bodies burn in their rapid flight if above the atmosphere, and therefore without oxygen? or does a combustible gas fill all space, and thus allow flaming substances to feed upon it at any elevation? If such masses are projected from a distant planet, we thus learn that some of the substances forming the *crust* of

(1) *Pyrites* is derived from the Greek word for fire, and is applied to those ores which exhibit a bright appearance.

the earth exist in the other globes of the solar system, and receive new views of that uniformity which appears to rule the most distant parts of the universe. Enough, however, has been said to call the reader's attention to the existence of the meteoric metal, and we must now proceed to a survey of the processes connected with the manufacture of iron.

The first important operation is preparing fuel for the furnaces, a work of the greatest importance, as upon it depends the quality of the iron produced, and consequently, the profits and fame of the manufacturer. The reader may here inquire whether coal is not found abundantly in the iron districts? We answer, most certainly; noble fields of coal stretch for miles beneath the countries where the fires from iron furnaces startle the traveller, and gleam over the wild, northern moors, or on the sides of the Welsh hills. But coal will not suit the manufacturer's purpose; it will spoil his iron, and must, therefore, be *coked* before it can be used in the furnace. The best fuel is charcoal, which is consumed in the Swedish furnaces, and was formerly employed in England at the iron works, until the vast increase of the manufacture rendered the employment of such a substance impossible. Even in the time of Elizabeth, the great consumption of wood in the iron works induced the legislature to prohibit by statute the use of such a fuel, and there is no reason to apprehend that the manufacturer will infringe this law in 1847. Since sufficient charcoal cannot be procured, the next object is to provide a fuel nearly resembling it, and this coke supplies. Before, then, the ore can be in the least degree acted upon, an important preliminary operation is essential to expel from the coal those substances which are injurious to the iron. *Coking* is thus effected. A large quantity of coal being spread over the ground, the mass is lighted, and when the flames begin to rise, the whole bed of burning matter is covered with ashes to keep out the air, after which the coal is left to burn out, and by this process becomes changed into coke.

Should a person unacquainted with the various works of an iron district be conducted into the midst of such a country on a dark night, he would suppose himself placed in the heart of some volcanic region, with craters holding forth their fires from deep-seated centres of flame. Here in a valley spreads one fiery bed, resembling a lake of molten matter, swelling with its fierce glow above the surface; there on the side of a bleak mountain, a flaming chasm seems opened in the side of a volcano. To increase his surprise, figures like men are seen to dart to and fro amidst the sulphurous glare, as if performing some incantation.

Such feelings might influence the person whom we have supposed suddenly introduced to the novel spectacle; but the inhabitants of the districts are too accustomed to these sights to express wonder at things which are connected with their daily pursuits. Thus the smoke of Vesuvius arrests the earnest gaze of the Englishman who enters for the first time the bay of Naples, but has little attraction for those who have dwelt from childhood within sight of the opening through which the subterranean fires of southern Europe have for ages escaped.

However grand these coking fields may appear to a stranger, the manufacturer is too much engaged in the operation to pay attention to its picturesque circumstances, as profit alone, not a striking scene, is his object. The anxiety often attending the work may be estimated from the immense loss sometimes occasioned during one stormy night, when the wind sweeping along an exposed hill prevents the burning mass from being effectually covered by the ashes, in consequence of which an inferior coke is produced, and enormous quantities of the fuel consumed, in spite of all the worker's care. In such a night, a hundred tons of coal may thus be lost by exposure to the atmosphere, an important item in the expenses of a manufacture requiring the most rigid economy in all its branches. The

loss of the fuel, however, is the least mischief produced by a bad coking: the iron will be deteriorated by the defects of the coke, when the latter retains sulphur or silica; and the effects will be seen through every stage of the manufacture, and be at least evident in the quality of the iron itself when brought to market.

Having now observed the preparation of the fuel destined to feed the furnaces, and produce results never witnessed by Prometheus¹ himself, we must proceed to an examination of the different operations by which the rough iron ore is changed into the useful metal. The first process is that of *roasting*, by which various vapours are expelled from the ore by exposing it to a heat sufficient for this purpose, but not so intense as to liquefy the mineral. Were these gases allowed to remain they would interfere with the subsequent operations of melting and refining; it is, therefore, of the highest consequence to *dry* the iron earth, and expel from it all watery and sulphurous particles. The task is not one which a rude, careless man, can satisfactorily perform, however simple the mere process of roasting a mass of ore may appear to the reader. In fact, we shall find, through every stage of the iron manufacture, that the greatest attention to all the details of the work is expected from the workmen, who are thus far removed from the dullness often produced by labours requiring little exertion save that of mere animal power.

The ore is put into a kiln for roasting, where the chief point requiring the workman's care is to preserve the heated mass within given temperatures, so that the heat shall neither fall below, nor rise above a fixed limit. If the furnace be too hot, the ore will begin to melt, and the pieces stick to each other, which is to be avoided; and if the fires be kept too low, the roasting will be inefficiently performed; in other words, the water and sulphur will not be sufficiently expelled from the mass. A great diminution in the weight of the ore is caused in the roasting, by which about one-fourth of the original is lost; a result to be expected when we consider the vast quantities of vapour driven from the rough ore by the heat.

The reader will remember that in this operation no *melting* has been permitted; this is the next step in the manufacture, and is termed *smelting*, a word apparently derived from the Saxon language, in which its root was of the same import with the modern term melt. The operation of smelting is thus performed: a large quantity of the roasted ore is put into a furnace, which is a clumsy shaped mass, often fifty feet high, and to the ore a certain bulk of coke and limestone, or clay, is added. The furnace being heated, the whole contents are reduced to a fluid; the metal sinks through the fiery mass to the bottom of the furnace, whence it escapes, when sufficiently prepared, through a hole purposely plugged up with earth or clay till the moment for extracting the melted iron. Thus the whole mass is kept simmering for about twelve hours, exposed to the most intense heat which the arts of the metallurgist can produce. The degree of heat requisite to melt iron would be represented by nearly 18,000° of Fahrenheit's thermometer; to support this the furnaces are constructed of the materials most fitted to resist the constant action of fire, such as fire-proof bricks, laid in fire-clay instead of mortar, and raised upon the most solid masonry. The lower part, on which the fluid metal rests, called the "hearth," is often formed of grit-stone, cemented with fire-clay; and even these are soon burnt into a basin-like shape by the constant heat.

Some may now inquire the object for which the lime, or clay, is introduced with the ore into the furnace, as this may seem like adding foreign substances to the mineral mass. This iron will not separate from the earth with which it is mixed without the assistance of some substance called a flux, which attracts to itself the

(1) Perhaps it is not superfluous to inform some readers that Prometheus was deemed the bestower of fire upon men, and, therefore, regarded as the author of all arts.

non-metallic matter, and then enables the liberated iron to sink to the bottom, leaving the foreign substance with which it had been united floating at the top, like a thick scum or crust of molten lava. If the iron is calcareous, it is evident that no object will be attained by adding more lime; clay is then used as a flux. It is therefore only with argillaceous iron ore that lime is employed. When the roasted ore, with the proper quantity of fusing material and coke, has been placed in the furnace, the utmost watchfulness becomes necessary to keep every process in the right state, and secure the proper quantity of iron having all the requisites of a good marketable metal. Too much heat may not only injure the massive furnaces, by burning away the solid brickwork, but the iron produced is then bad in kind, and small in amount; whilst a too slow fire will also cause results equally pernicious. To secure the utmost attention on the part of the workmen, the masters usually pay them according to the quantity of metal produced; thence, not only the keeper of the furnace, but all his fellows, have the strongest motives for the exercise of care and skill.

(To be continued.)

Poetry.

[In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.]

TRUE WALTER.

From the German of Uhland.

REV. HENRY THOMPSON.

It was Childe Walter, true and good,
Hode past the lone chapelle;
There knelt a maid, in rueful mood,
Before our Lady's cell.
"O stay, Childe Walter! true love, stay!
And know'st thou not the voice, I pray,
Thou erst didst love so well?"
"Whom see I here? the faithless May,
Whilome, alas! mine own?
Where hast thou left thy silk array?
Where gold and jewel stone?"
"O sorrow that my sin has cost!
With thee my paradise I lost!
'Tis found with thee alone."
He rais'd her soft, that maiden bright,
In pity, to his selle;
She cast her arms around the knight
She lov'd again so well.
"Ah, Walter true! this heart, I feel,
It beats on cold unyielding steel;
On thine it throbs to dwell."
Into Childe Walter's towers they pace;
The halls were still and lone;
Full light did she his helm unlace:
His lusty hue was gone.
"Sunk eye, and cheek all pale of blee!
O ne'er wert thou so fair to me
As now, thou constant one!"
She loos'd the corslet from the breast
Torn by her heedless sin:
"What see I here? A haircloth vest!
Dost mourn for kith or kin?"
"My best belov'd I mourn full sore,
Whom I on earth shall find no more,
Yet may hereafter win."

(1) A word formed from *calcium*, the name of the metal from which lime is formed.

(2) This word is derived from the Latin *argilla*, clay.

(3) This word is used for *maid* in our old English writers, whom Uhland himself imitates in this and many other of his ballads; an imitation followed in this version. The other archaic words are well known.

She casts her weeping at his feet;
She wrings her hands in prayer—
"This poor sad heart, for mercy sweet,
Thy pardon let it share.
O raise me now to joy anew!
O let me on thy bosom true
Forget all crime and care!"

"Stand up, stand up, my poor lost fere!
To raise thee now were vain:
My arms are stark, my heart is sore,
I feel nor joy nor pain.
Go, pine like me till life is fled;
For love is dead, for love is dead,
And never lives again."

Rectory, Wrington, Sept. 24, 1846.

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne.*

OUR CHILDHOOD.

ALL minds, even the dullest, remember the days of their youth; but all cannot bring back the indescribable brightness of that blessed season. They who would know what they once were, must not merely recollect, but they must imagine the hills and valleys—if any such there were—in which their childhood played; the torrents, the water-falls, the lakes, the heather, the rocks, the heavens' imperial dome, the raven floating only a little lower than the eagle in the sky. To imagine what he then heard and saw, he must imagine his own nature. He must collect from many vanished hours the power of his untamed heart; and he must, perhaps, transmute also something of his maturer mind into those dreams of his former being, thus linking the past with the present by a continuous chain, which, though often invisible, is never broken. So is it too with the calmer affections that have grown within the shelter of a roof. We do not merely remember, we imagine, our father's house, the fireside, all his features then most living, now dead and buried; the very manner of his smile, every tone of his voice. We must combine with all the passionate and plastic power of imagination, the spirit of a thousand happy hours into one moment; and we must invest with all that we ever felt to be venerable, such an image as alone can fill our filial hearts. It is thus that imagination, which first aided the growth of all our holiest and happiest affections, can preserve them to us unimpaired,—

"For she can bring us back the dead,
Even in the loveliest looks they wore."

—*Blackwood's Magazine*, 1837.

Reading the Will.

A PAGE FROM THE DIARY OF A FORTUNE-HUNTER. BY MRS. ABDY.

This morning I received a note from my affianced bride, Constance Graham, requesting me to attend at two o'clock that day at the house of her late uncle in Harley-street, for the purpose of hearing his will read. I had the greatest pleasure in complying with this invitation. I had really begun to fancy that old Mr. Graham was going to remain perpetually on the earth, "like Mrs. Norton's "Undying One;" he was always on the point of death, and always cured, and better than ever in the course of a few days; last month the cold water system seemed completely to renovate him, but he suddenly relapsed, departed from the world, and left fifty thousand pounds and a will behind him. Though Constance is the prettiest and most accomplished girl of my acquaintance, I had deter-

mined never to marry her while her uncle lived; he had frequently proclaimed her his heiress, but as frequently took offence at something or at nothing in her behaviour, and bequeathed his wealth to a hospital, prison, or lunatic asylum. I felt quite easy on the present occasion, for Mrs. Bates, Mr. Graham's house-keeper, had given me information that, only an hour before her master's death, he had told her he had handsomely provided for Constance. I felt, however, that it was my policy to appear ignorant of that circumstance, Constance being very romantic, and Constance's mother very suspicious.

At the appointed time I walked into the drawing-room in Harley-street,—the very few relatives of the old gentleman were assembled. There was Constance, look-

ing as Hebe might have looked if Hebe had ever worn crape and bombazine; Constance's mother looking stiff, cross, and uneasy; an elderly female cousin, and a stripling nephew of the deceased. I feared none of them. I knew that Mr. Graham disliked his fine lady sister-in-law, despised the servility of his elderly cousin, and dreaded the frolics of his stripling nephew. I seated myself by Constance, and in a soft tone began to protest my affection and disinterestedness. "Knowing the caprice of your uncle, my beloved," I said; "I have every reason to conclude that I shall hear you are disinherited; this, however, will be of little moment to me; I have enough for comfort, though not for luxury, and, as the song beautifully says—

'Still fixed in my heart be it never forgot
That the wealth of the cottage is love.'

"I fancy, Mr. Chilton," said Constance's mother, looking excessively sneering and shrewish, "that it is pretty well known that my daughter is the sole heiress of her uncle's wealth."

"Indeed, Madam?" I replied, with a start of surprise, "I was not aware that any surmise was hazarded concerning the contents of Mr. Graham's will."

"I have heard a surmise hazarded," sharply interposed the elderly cousin, "that Mr. Graham was not in his senses when he made it."

"The mind must be both base and weak," retorted Constance's mother, "which could give credence to such a rumour." And forthwith a sparring dialogue took place between the two ladies, during which I whispered to Constance a page of Moore's poetry done into prose.

Temple now entered the room, the solicitor and intimate friend of the late Mr. Graham; he was a handsome young man, and had presumed at one time to lift his eyes to Constance; he opened the will, and we all became mutely attentive. Oh, what a disappointment awaited us! Three thousand pounds were bequeathed to Constance, (this was the old fellow's idea of a handsome provision!) Five hundred pounds to the elderly cousin, ditto to the stripling nephew, small legacies to the servants, and the remainder of his wealth to found a cold water establishment for the reception of those who were not rich enough to pay a gratuity for being half-drowned. Temple read the names of the attesting witnesses, and then refreshed himself with sherry and biscuits. As he was a friend of the family, his presence was no restraint on conversation.

"That will ought to be disputed," said Constance's mother, looking very red, "I do not believe Mr. Graham was in his senses when he made it."

"I thought," said the elderly cousin, with a sneer, "that the mind must be both base and weak which could give credence to such a surmise."

"Dear mamma!" said Constance, "do not be decomposed; I am very well contented—I shall not be quite a portionless bride." Constance here held out her delicate white hand to me—I affected not to see it.

"My dear Miss Graham," I said, "do not believe me so cruel and selfish as to wish to plunge you into poverty."

"I thought you said that your income was sufficient for every comfort," remarked the stripling nephew.

I did not condescend to answer him, but continued: "No, Constance, though it breaks my heart to do so, I give you back your freedom, saying, in the pathetic words of Haynes Bayly, 'May your lot in life be happy, undisturbed by thoughts of me!'" I was just making to the door, leaving Constance looking more like Niobe than Hebe, when Temple said, "I think the party had better remain till I have read the codicil."

I re-seated myself in amazement, and Temple forthwith read that the testator, being convinced that he had received no benefit from the cold water system, revoked and rescinded his legacy to it, bequeathing the same to his beloved niece, Constance Graham.

"Constance! dear Constance!" I exclaimed, in the softest of tones. But Constance looked neither like Hebe nor Niobe, but as stern and severe as Medea. I then attacked Temple. "Is it legal," I said, "only to read part of a will?"

"I read every word of the will," he replied, "and, having greatly fatigued myself by so doing, I trust that it was perfectly legal to refresh myself with a glass of sherry before I read the codicil."

I was going to utter some further remarks, when Constance's mother said, "Good morning, Mr. Chilton!" in a tone of voice which left me no alternative but to echo her leave-taking, and I descended the stairs, pursued by a smothered laugh from the party in the drawing room, returned home in very low spirits, and entered my adventure or rather misadventure in my diary, deducing from it this valuable piece of advice to gentlemen in search of fortune: "Never believe that a will is concluded till you have inquired whether there is any codicil to it."

THE IRON MANUFACTURE.

THE intense heat required in the smelting and similar processes is produced by blast machines, which drive air into the furnaces by a steam-engine. Those who have only seen the effect of a blacksmith's bellows on his fire, can form little notion of the effects produced by the impulsion of volumes of air into a glowing furnace by powerful machinery. Strong iron vessels are filled with air, which is then forced through pipes by the steam-engine piston, into the furnace, thus kept at the heat requisite for the smelting operation. It might be imagined that the introduction of such volumes of air would be sufficient for the production of all the heat required, but not so have the iron-masters thought: *hot air is now poured into the furnaces, and thus the heat is never diminished by the influx of cold matter upon the melted mass.*

In working the furnaces, the introduction of air alone engages the most anxious thoughts of the operative, as three important objects are sought to be obtained, all of which may be lost by slight neglect. One is the introduction of a *uniform* supply of air, as any irregularity in this respect will injure the action of the furnace, and diminish the value of the metal. The blast must not, therefore, be strong at one moment and feeble the next; now this uniformity cannot be secured by anything resembling the *bellows-action*, in which the air must rush out with variable force; to obviate this the air is collected in a cylinder, and thence sent to the furnace. The next object of care is the regulation of the *quantity* of air most suitable to produce the greatest amount and the best quality of iron. This demands the most acute watchfulness, for even a sudden change of wind from east to west will affect the working of the furnace. The anxiety of the workmen is much increased by the unaccountable variations sometimes exhibited by a furnace, which, after working well, begins all at once to fail in its performances, baffling all the men's skill and labour to detect the causes of the disorder. A third object still farther increases the responsibilities of the keeper when hot air is used in the blasts, for it is then necessary to guard against the absorption of moisture by the heated air, rendered more capable of absorption in its hot condition. For, as the temperature required is 300° of Fahrenheit, and heated air absorbs moisture with great rapidity, there is considerable risk of damp being carried into the fire from the blast machine; a result which would materially impede the working of the furnace.

Thus, in the management of the air alone, great skill and experience are essential; and the quality of the

iron in a high pressure engine, or in a first-rate war-frigate, depends on the caution exercised by some plain Welsh or Lancashire workman.

The holes through which the blast-pipes conduct the air into the furnace are usually about four inches in diameter; these are called *twyers*, (pronounced *twyers*;) the number of which varies, most furnaces having three, and some but one. The effects produced on the metal by the heat may be described as follows. The oxygen is expelled from the iron, and unites with the carbon of the coke, forming carbonic oxide; the carbon combines also with the fluid metal, and the lime with the earth of the ore, upon which the pure iron falls through the fuel to the hearth.

Thus the operation of smelting is in reality nothing but a great chemical process, by which the various substances in the furnace are brought into new relationships.

When the iron has been reduced to the proper state, it is let out from the furnace into a trough formed in the sand, called a *sow*, from which smaller troughs branch off called *pigs*, and the iron when cooled is therefore called *pig-iron*. This is the first condition in which iron presents itself to our view, and in this state it is also brought into the market, being classed, according to its qualities, from No. 1, to No. 6. The first three, Nos. 1, 2, 3, are called foundry iron; and the last three, Nos. 4, 5, 6, are styled forge iron; the former being in a state fit for *casting*, and the latter only adapted for the forge.

No. 1 contains much carbon, is soft, and used for ornamental work, such as requires the most delicate moulds.

No. 2 contains less carbon than the last mentioned, and does not run to the same degree of fluidity, but will, nevertheless, fill the interstices of moulds when not very fine.

No. 3. This is harder than either of the preceding, contains also less carbon, and is fit either for the foundry or the forge. The large parts of machinery are formed from this iron, such as the wheels of engines, cylinders, &c.

No. 4. This is classed with *forge* iron, but as No. 3 is sometimes cast and sometimes forged, so is it with No. 4, which is often used for large castings.

No. 5. This is called mottled iron, and is never cast, but used in the forge alone.

No. 6 contains the least carbon of all pig-iron, and runs so thickly from the furnace that it will hardly flow into the moulds or "pigs." It is so hard that a chisel cannot scratch it, yet its extreme brittleness causes the largest bars to break with a slight blow.

The reader will note that the varieties of these six classes of iron arise in some way from the presence or absence of *carbon*; and thus the same substance which causes the diversities in the vegetable and mineral kingdoms, exerts its hidden power in the molten and boiling iron.

The next operation after smelting is *refining*, by which the metal is still further purified from foreign matters, and especially from the carbon and oxygen yet remaining in the pig-iron. The furnaces, into which the rough pigs are now cast, consist of low oven-like structures, called *refineries*, having the bottom or hearth formed of fire-bricks, and the sides of cast iron, kept as cool as possible by a stream of water flowing round them.

This last precaution is rendered necessary by the intense heat to which these refineries are exposed, which would certainly melt parts of the furnace itself, were not some counteracting agency employed. Above such a furnace rises a chimney of considerable diameter, though not more than eighteen or twenty feet high.

The intense heat produced suffices to bring the whole of the iron into a proper state for running into the moulds in about two hours: this will give twelve runs in the twenty-four hours; and as such furnaces are kept at work day and night, between seventy and eighty runs will be obtained in a week.

When the refining has advanced to the proper point, the liquefied metal is run out through a hole into moulds prepared for the purpose, into which the brilliant stream falls hissing, flashing, and throwing out the most beautiful scintillations. The moulds are placed over cisterns of water, which keep them cool, and chill the boiling iron as it flows over the bottom of the trough. Thus the metal has been passed twice through the fires, once in the smelting furnace, and again in the refineries, being brought in the former from its ore condition, and receiving in the latter process an additional purification.

But the work is not yet over; the iron has but reached its second stage: various processes must be passed through before the finished bar-iron appears; and the next operation is one called *puddling*, by which the metal is further freed from the gases and foreign matter mixed with the ore. The puddling is thus performed: a quantity of the refined iron is put into what is called a reverberatory furnace, in which the flame is confined as in an oven, and forced down upon the surface of the broken metal. In about half an hour, the pieces of iron begin to melt, and are kept stirred about with an instrument, till all is mixed in one fluid mass. This stirring causes the melted metal to part with more of its oxygen and carbon, the escape of which is indicated by the heavings of the liquid iron, as the expanded gases swell the surface when bursting from their fiery prison. After some time the metal is observed to thicken, the particles collect in small lumps, and as the stirring proceeds, the conglomeration goes on till the iron acquires the consistency of thick paste, which enables the puddler to form with his tool five or six roundish masses of half liquid iron.

The heat required in the puddling furnace is sometimes so intense as to burn the bottom of the furnace itself, notwithstanding the coating of scoria by which it is protected, and the draught regulator, at the top of a chimney thirty feet high, is frequently red hot. When the soft balls are thoroughly formed, the workman removes them from the furnace with a peculiar kind of gigantic tongs, and places each ball of hot metal under a hammer weighing four or five tons, by the repeated strokes of which the puddled masses are flattened into oblong pieces. The powerful strokes of these massive hammers produce a still further refinement of the iron, by driving out more of the oxydized matter which still clings with tenacity to the metal. A spectator unaccustomed to the phenomena of the iron works, would be disposed to keep at some distance during this "shingling," for the fiery particles shoot in all directions from the glowing balls, and compel the shinglers to wear a protecting dress. The escape of gas is seen by the hissing and flaming of the metal, as the enormous hammers rapidly fall, and seem as if they must necessarily beat every particle of vapour from the iron.

When the operation is over, the balls change their names, being called *blooms*, and are then prepared for further processes, yet necessary to make the iron useful to man. It sometimes happens that a ball has been badly puddled, either through want of attention in the workman, or the badness of the iron employed: in this case it takes the singular name of a "*shadrach*," a term evidently borrowed from the narrative in Daniel of Shadrach, Meshach, and Abednego. Nor is the word so applied inappropriate, for as Shadrach was little affected by the fire through which he had passed, so the imperfectly puddled ball has not been rightly acted upon by the furnace.

The main object of puddling is to purify the metal, and thus to render it more fitted for sustaining the tasks to which it must hereafter be subjected in the form of steam-engine cranks or chain cables; and the greatest attention is therefore paid to the operation. The *shingling* is not quite so important, being chiefly a means of bringing the metal into a more convenient shape for the process called *rolling*. The agencies now

become more *visible*, for, in the smelting, refining, and puddling furnaces, the transforming causes are principally chemical; certain substances are separated from others, in which new properties are developed; but all this is veiled in a sort of mystery, and hidden from our inspection. Now begin the more mechanical operations, and we are surrounded by the din of hammers, shears, and engines.

The next work is the *rolling*, or passing the oblong and hammered blocks of iron between rollers of great power. This compression stretches the metal into longer and thinner pieces than could be produced from the strokes of any hammer. When the heavy bars have been drawn through the first pair of rollers, they are subjected to the action of a second pair, placed nearer to each other than the first. A third, and a fourth compression between still closer rollers follow, and thus the iron is gradually drawn out and reduced in thickness by such repeated stretchings.

These successive compressions not only render the texture of the iron more compact, but expel more of the oxydized matter, or *cinder*, as it is called, and thus the rolling performs an important part in the purification of the metal.

As another *rolling* must be noticed at a subsequent stage of the manufacture, we omit a more detailed description of the operation in this place, and proceed to describe the process of *cutting the bars* into the length required by the workman. The common notion of shearing may suggest many simple operations, but that solid bars of iron can be cut with an ease equal to that with which a child divides a piece of cotton with a pair of scissors, occurs to the imagination of few persons. A cutting instrument is moved up and down by a steam engine, and in its descent divides the bar with all the facility characteristic of power. The force of the stroke is, nevertheless, so great, that unless the workman is cautious in placing the bars properly beneath the shears, a severe wrench will be sustained by the man, caused by the powerful impulse of the shears upon the bars. But this operation is only the prelude to others of an important character, to which we must now advert.

The last remark may induce some readers to exclaim, "What! is the obstinate metal yet unsubdued? are more fires and giant-like pressures still needful to bind the stubborn mass to the purposes of man?" Yes, reader; the powers of mighty engines and the energies of intense furnaces must again be employed ere the iron will yield its latent riches, or develop its hidden powers. The bars which have just been rolled cannot be sold; the manufacturer prizes them not; and human skill must further combine with human labour to mould the stubborn pieces into marketable iron. The rolled bars are at present so full of defects that no smith could use them for the commonest purposes, and, though some degree of malleability and toughness have been gained, more finish is requisite. What then is next to be done? Another furnace is now called into operation, called the *heating* or *balling* furnace, in which the iron is brought to a high temperature to fit it for welding. In the previous furnaces the metal was liquefied, but no such result is here allowed, as the object desired is to *soften* and not *melt*. The manufacturer wishes several of the rough bars to be sufficiently softened for welding together, so that two or more may be compressed into one by rolling. But to effect this the *bars* must be softened, and put through the rollers before they become cold.

A pile of the rough bars is placed in a furnace, where they remain till brought to the heat required. If they are removed from the furnace too soon, the bars will not be sufficiently softened to admit of that union of several into one which it is the object of the manufacturer to effect; and, if they are too long exposed to the heat, some portion will be burned, and so rendered brittle: hence, the great care of the workman is em-

ployed to detect the proper moment when the heating has been carried to the safety point. The importance of seizing the exact instant may be estimated from the fact, that a delay of two or three minutes will suffice to deteriorate whole piles of iron, and render them unfit for sale.

This *heating* process causes the metal to lose considerably in weight, as a great bulk of impure substance, in other words the oxide, called *cinder*, is detached from the bars, and flows down to the bottom of the furnace. The metal has now by numerous stages been reduced to a condition capable of freely parting with the oxydized substance, without the necessity of using machines for its separation. The oxide, accordingly, first collects on the surface of the heated bars, over which it forms a kind of mineral glaze, protecting them from the too high temperature of the furnace. Thus the very substance which the manufacturer has been so long endeavouring to expel from his metal, now performs, as it is finally leaving the iron, a beneficial service, by securing the piles from the scorching effects of intense heat. So important is the protection afforded by the covering of melted oxide, that, when one part of a bar accidentally loses this coating, the iron is destroyed by burning. The quality of the metal as it leaves the heating furnace is of the greatest importance, for this is properly the last stage in the purification; whatever operations yet remain, being more adapted to give soundness and toughness, than impart purity.

Thus, at last, the rough mass of ore appears in the shape of a valuable piece of iron, from which the smith may procure all the various articles demanded by the numerous pursuits of men.

Not that even *this* iron is *perfectly pure*;—such a piece of metal has probably never been made, and will, perhaps, for ever elude all the skill of the modern manufacturer; but it is sufficiently freed from carbon and oxygen to become available for welding purposes.

What is the exact difference, a reader may ask, between this malleable bar-iron, as it leaves the heating furnace, and the pig-iron, as it ran into the moulds after the smelting?

The proposer of this question does but repeat the inquiry which has exercised the attention of the most scientific chemists; indeed there are few questions connected with manufactures, more puzzling than that just proposed, or to the answering of which our present amount of knowledge is less fitted. The *mechanical* properties of the pig-iron marked No. 6, are totally different from those of the finished bar-iron; the latter being capable of sustaining the blows of hammers, and admitting of various operations requiring malleability; but the former so brittle, that a stroke will shiver the largest pieces. Notwithstanding this diversity, the *chemical* qualities of the two are nearly the same; both having but a small proportion of carbon. Thus we have the singular case of two pieces of metal, possessing nearly the same constituent qualities, and yet exhibiting the most diverse mechanical properties. The more "pig" resembles bar-iron in its chemical nature, the greater is the diversity in other respects: the more carbon there is in pig-iron the more tough it becomes, whilst bar-iron decreases in brittleness with the loss of its carbon; thus exhibiting a singular contradiction between the internal structure and external qualities, and proving how little we can sometimes reason from a mere chemical analysis of substances.

The last step in the manufacture of iron is the *rolling*, which brings the bars to their finished state. The great object of the workman in this operation is to weld several bars into one, and so improve the texture of the iron by such amalgamation of the metallic fibres as shall ensure the greatest possible strength in the bar. The action of the roller in thus combining several pieces of iron may be compared to that of a hammer in the common smitheries, where two bars of heated iron are frequently beaten into one. The hammer,

however, acts with far less efficiency on the small iron of the blacksmith's workshop, than the rollers upon the heated bars taken from the furnace; for the pressure of the roller is uniform, and the force constant, but the hammer only acts at the instant of the stroke, which is not always given with the same power, and therefore not unvarying in its effects. These successively diminishing rollers resemble the drawing machines in the cotton manufacture, by which the thread is gradually extended to the required fineness; and thus, in two such opposite processes, we perceive the application of the same mechanical principle to effect a similar result, either in a bar of iron or thread of cotton. As the bars are passed through the rollers in a heated state, the wear and tear of the hard iron rolls themselves is very great; nor is this surprising when we recollect the force with which they compress the bars, and the great heat of the latter, which must inevitably tend to wear away the surface of the rolls. Nor does the case-hardening of these altogether prevent the effects of such powerful friction, for the number of revolutions made by the small rolls in a minute amounts to about two hundred and forty, which cannot but rub away continually a portion from the surface of the hardest rollers. The various details connected with the manufacture of boiler plates, nail rods, sheet iron, and other divisions of this extensive trade, need not here detain the reader. It may, however, be necessary to state that the rods from which nails are made, are cut into long slits by steel cutters as they are rolled, and thus a heap of rods sufficient for millions of nails is quickly slit by this peculiar machinery. Nor must we attach little importance to this branch of the iron trade; for the making of nails engages the attention of numerous scientific men, and has occupied the investigation of engineers, who have taken out patents for improved methods of manufacture. The boiler plate is, in its first shape, a thick square piece of iron, and this being brought to the proper degree of heat is passed once between the rollers, which are then brought nearer to each other by the action of a powerful screw, and the plate is pressed a second time, after which the rollers are again brought nearer, and the plate compressed a third time; thus the operation is repeated till the plate is reduced to the state required.

(To be continued.)

SOME PASSAGES FROM THE JOURNAL OF A WILTSHIRE CURATE.¹

January 1, 1765.—This year has commenced with a most extraordinary and unheard-of event. As early as six o'clock this morning, when I was still in bed, reflecting on the sermon I am to preach to-day, I heard a sharp knock at the door. Polly, who was already down stairs, hastened to open it, and found a respectable looking man with a large box under his arm, which he gave to her with these words.—“Mr. —” (the foolish girl did not catch the name,) “Mr. — sends this box to the clergyman, and entreats him to take the greatest care of its contents.”

Polly, though greatly astonished, took the box without hesitation, and the bearer instantly disappeared. Polly knocked gently at my door to ascertain whether I was awake. I desired her to come in, when she wished me a happy new year, and added laughing, “See, dear father! my dream has come true; this must be the bishop's mitre.” She then presented the new year's gift which had just been brought for me, but I regretted she had not inquired more particularly the name of the unknown giver. While she was gone to light the fire, and to call Jane, I rose and dressed myself. I do not deny that I was burning with curiosity, for hitherto, it must be owned, the presents to the curate of Cricklade on new year's day had been few and insignificant. I

suspected that the good farmer, who seemed so kindly disposed towards me, had sent me a basket of provisions, but I could not comprehend his modesty in sending them before daylight. When I entered the sitting-room, I found the two girls standing by the table on which the box was placed. It was carefully sealed up; the address to me written in large letters; and two large round holes neatly cut in the top. I lifted it up and found it tolerably heavy. With Jenny's assistance, I gently raised the lid, for I had been desirous to handle it carefully, and, on removing a fine white cloth which covered everything, there lay ——— No, it is impossible for words to describe our astonishment! “Merciful God!” we all exclaimed as with one voice. There lay a young child, some six or eight weeks old, dressed most beautifully in white with pink ribbons, fast asleep; its little head rested upon a pillow covered with white satin, and its cap and even the coverlet were trimmed with the finest lace. We stood gazing on it for some time in speechless amazement: at last, Polly burst into a kind of nervous laugh, exclaiming, “What is to be done with it? this is no bishop's mitre!” Jane, gently stroking the cheek of the sleeping infant, said with an expression of the softest pity, “Poor little creature! thou hast no mother, or perhaps the wretched mother dare not own thee! Gracious God, to desert such a lovely helpless little being! Sleep on, poor forsaken innocent! Thy parents, perhaps, would tremble with shame and anguish at thy presence, but sleep in peace, we will not reject thee—well have they chosen, I will be thy mother!” As Jane spoke, two large tears rolled slowly down her cheeks, and, taking the sweet tender-hearted maiden in my arms, I pressed her to my heart, and said, “Let it be so. Be a mother to this babe. Those who are themselves the victims of misfortune, should assist their fellow-sufferers. God proves our faith: or rather, it is because he *knows* it, that he has sent us this poor deserted little one. True, we scarce know ourselves where to look for food on the morrow, but he who has sent the desolate orphan to us for refuge, will give us the means of supporting it.”

Thus our determination was soon taken, long ere the babe awoke from its soft and gentle slumbers. It was in vain that we exhausted ourselves in conjectures concerning its parents, who must know us, as the box was directed to me. Unluckily, Polly could tell us nothing further of the man who brought it to the door. And now, whilst I again read over my sermon for the new year, “On the wonderful Providence of the Almighty,” my daughters commenced an interesting conversation on the measures to be taken for the comfort and well-being of the little stranger. Polly's childish joy was excessive, but Jane was serious and deeply agitated. I myself felt as if the new year had commenced by a miracle, and—perhaps it was a superstitious feeling—as if the child were a guardian angel, sent to assist me in my deep distress. I cannot express what a weight seemed taken off my heart. I felt inexpressibly happy and consoled.

The same evening.—I returned from the performance of my sacred office, tired and exhausted. The muddy road which I had to traverse for many miles was nearly impassable, and I reached home fatigued and dispirited. But many blessings awaited me; the warm and comfortable room, the cheerful welcome of my daughters: they had prepared supper for me, and the almost forgotten luxury of a bottle of wine, a new year's gift from some kind but unknown hand, soon restored my falling strength. But nothing gave me more pleasure than the sight of the laughing babe, crowing and kicking in Jenny's arms. Polly showed me the little bed she had made up for our nursing, and then pointed to the quantities of linen and clothing of the finest materials, which were placed with it in the box, and then gave into my hands a letter addressed to me, which was found at the child's feet.

Curious to learn something of the birth of my unex-

(1) Continued from page 22.

peeted visitor, I hastily tore open the packet. It contained a rouleau of twenty guineas, and a letter which ran thus:—"Impressed with the fullest confidence in your pious and humane feelings, the unfortunate parents of this beloved babe have committed him to your care. He is already christened; his name is Alfred. The first payment for the expenses he will entail upon you accompanies this, and the same sum will reach you punctually every three months. We entreat you to take this innocent creature under your protection, and we earnestly recommend him to the tender care of your sweet daughter Jane." When I had read the letter aloud, Polly jumped up, and, clapping her hands with delight, exclaimed, "There! is not that as good as the bishop's mitre? Good heavens, how rich we are! Now we shall do well enough without the curacy." But I was not quite so well pleased, and I wished the letter had named the "sweet Polly," also. We read it over twenty different times. We could scarcely believe our eyes at the sight of so much gold. Here was indeed a new-year's gift! I found myself suddenly relieved from my bitterest anxieties for the future. But in what a strange incomprehensible manner! In vain I repassed in my mind every individual who, from their station, or other circumstances, might find themselves under the necessity of temporarily concealing the birth of a child, or who would offer such generous payment for an act of Christian charity. It was quite hopeless! I could discover no one: and yet the parents must have been thoroughly acquainted with me and mine. Wonderful are the ways of Providence!

January 2d.—Fortune overpowers me with its favours! This morning I received another packet by the post. This time it really was a letter from Fleetman, enclosing the sum of twelve Pounds. This is too much! for each shilling he has repaid me twenty. He must have been wonderfully successful; indeed he tells me so. I know not how to express my thanks to him, for he has unluckily omitted to tell me where to direct to him. God grant that this influx of riches may not elate me too much. I now begin to hope that I may in time be enabled to pay honourably Col. Brooke's debt to Withell.

Nothing could equal the delight of my daughters when I told them of Fleetman's letter. I do think he has bewitched them: Jane turned as red as fire, and Polly ran laughing up to her, and put her two hands before her sister's face. Jane really seemed quite angry with the foolish child. I read the letter to them, though with some embarrassment, for the young man is an enthusiast; his expressions are much more flattering than I deserve; indeed he exaggerates every feeling. Even what he says of my dear Jane appears to me too strongly expressed. I really pitied the confusion of the poor modest girl while I read. I hardly dared raise my eyes to her face. The passage which concerns her certainly is very remarkable; it runs thus,—“When I left your happy home, I felt, Sir, as if I once more abandoned my father's house, to roam through a world which was a desert to me. I never, during my whole life, shall forget you, or the happiness I experienced during those few short hours. I ever see you before my eyes, rich in your poverty, rich in Christian humility, rich in your patriarchal simplicity and elevation of soul; and the merry, charming, fascinating Polly; and Jane, — what words can describe her, what term can be applied to her, whose presence purifies and ennobles every earthly object! The moment in which she presented me with the money, will be eternally present to my memory; eternally shall I remember your kind assistance, and the sweet words of consolation which fell from her lips. Do not be astonished—I have still those twelve shillings; I would not change them for a thousand golden guineas! I trust soon to be able to open my heart to you. Never in my whole life have I felt so happy or so miserable as I do at present. I entreat you to offer my grateful respects to your lovely daughters,

if I am fortunate enough still to retain a place in their memory.”

It appears from this letter that he has some intention of returning to Cricklade: I hope he will; I should then be able to thank him in person. The excess of his gratitude has, perhaps, induced the young man to give me all he possesses in the world, merely because I assisted him in a moment of distress, by a loan which certainly comprised half the ready money I then possessed. This would annoy me greatly; he appears a thoughtless youth, but generous and warm-hearted.

Little Alfred improves delightfully with us. Jane, like a young mother, scarcely lets him out of her arms; he smiles at her, and seems already to know her. The girls manage the little stranger far better than I could have anticipated. He is really a fine creature, and looks quite beautiful, as he lies in his little cradle, close to Jenny's bed, who, like his guardian angel, watches day and night over her adopted son.

January 3d.—To-day, the new curate, Mr. Bleching, arrived at the inn, and sent for me. I went immediately, and was received very courteously. He announced to me that he was to be my successor in the curacy; that he wished, if not disagreeable to me, to enter upon the duties of his office as soon as possible; but that I might continue to inhabit the parsonage till Easter, as he had found a lodging which he could occupy for the present.

I replied that I should be happy to give up the entire duty to him immediately, as I should then be more at liberty to exert myself to find another employment. I only wished to preach a farewell sermon to that congregation who had for so many years listened to my earnest endeavours to explain and preach the word of God. It was arranged that he should come in the afternoon, and examine the state of the parsonage-house. His young wife accompanied him. She appeared rather proud and disdainful, and I suppose comes of a very great family, for nothing in the whole house would please her, and she scarcely deigned to take the slightest notice of my daughters. When she saw little Alfred in his cradle, she turned suddenly round to Jane, and said, “What, are you married?” Jenny became crimson, and shaking her head, replied in the negative, but with so much embarrassment, that I was forced to come to the poor girl's assistance. Mrs. Bleching listened to my story with intense curiosity, then shrugged up her shoulders, and turned her back upon me. I thought this very ill-bred, but said nothing. On offering them some tea, it was abruptly refused. I could see that the new curate was completely under the orders of his imperious lady. We were not sorry when our visitors departed.

January 6th.—If I may judge by the letter I have just received from Mr. Withell, he is a worthy and excellent man. He expresses his regret that I should be implicated in the unfortunate affair of the bond, entreats me not to distress myself, and says he shall be satisfied if I can pay my debt in ten years. He appears to be aware of my misfortunes, for he alludes delicately to the state of my affairs; but what affords me the highest consolation is that I see he considers me a man of honour, and I will show him that he is not deceived. I will go myself as soon as possible to Trowbridge, and pay him Fleetman's twelve pounds towards the liquidation of my unfortunate debt.

Although my daughter Jane assures me that she sleeps well at night, and that little Alfred does not disturb her, as he only requires to be fed once, nevertheless I am uneasy about her. She is not near so gay as formerly, though she has much more reason to be contented and happy now, than when we were anxious about our daily food. Sometimes she sits with her knitting in her hands, silent and buried in thought, her eyes fixed on vacancy, and her formerly active fingers hanging listlessly beside her; when spoken to, she starts like one in a deep sleep, and in some time before she understands what has been said; this is

evidently the consequence of broken rest, although she will not allow it. I cannot persuade her to sleep a little in the day-time: she declares she is perfectly well. Another thing, too, disturbs me about her: I really did not believe the girl had so much vanity: it is very clear that Fleetman's praises were not displeasing to her, for she asked me to give her his letter, that she might read it over again. She has never returned it to me, and keeps it in her work-basket! I doubt its being for what he says of me: poor little vain thing!

January 8th.—My farewell sermon received the tribute of tears from most of my auditors. I am now, for the first time, convinced that I am beloved by my flock. I have received the strongest expressions of attachment from all sides, and many have made me valuable presents. Never have I had so many delicacies, or so much wine in my house, as at this moment. Had I possessed the hundredth part in the days of want and privation, I should have esteemed myself fortunate. Now we are literally surrounded with luxuries: however, it is not ourselves alone who benefit by it; both Jenny and myself know all the poor families in Crick-lade, and they also profit by this abundance, and rejoice with us. I felt much agitated whilst preaching my last sermon, and it was not written without tears. I feel as if cut off from all that has hitherto formed my world,—from my sacred calling, from my early vocation. I am driven forth from the vineyard of the Lord, like an unworthy servant: and yet I have not laboured as an Hireling, but have planted many a fruitful vine, and cut away some unproductive branches. I am rejected from that vineyard, where day and night I have watched and worked,—where I have instructed, consoled, cherished, prayed! I avoided no sick bed: I strengthened the dying sinner in his last dread struggles, by the holy name of Christ. I left no poor man to perish alone, and I often brought back the lost sheep into the path of life. God of heaven! were not all these souls bound up with mine own? and now they must be torn asunder! My heart bleeds in agony, but thy will, O God, be done!

How willingly would I undertake all the duties of my office without salary! but it is too late; my successor is already in possession of my curacy. I have been accustomed to poverty from my childhood, and my youth and manhood were passed amid care and privations. We might all live upon the money I receive for little Alfred's expenses, and I would not think of the future, or care for what may become of my grey hairs, could I but continue to teach the word of God to my beloved parishioners. But, God's will be done. Let me not murmur at his dispensations! The tears which have blotted these words are not tears of bitterness. I pray not for riches, or better days, but, O Lord, drive not thy servant for ever from thy service, even though his strength is small! Let me enter once more into thy vineyard, and by thy blessing again win back souls unto the Lord!

DIARY OF A JOURNEY FROM ALEXANDRIA TO SUEZ.

BY A CADET.

As may be supposed, we made ourselves very comfortable, and, after eating and drinking enough, we walked down to a small Arab village about a quarter of a mile distant, where we found our donkeys, mounted, and set off for Cairo rather faster even than we had left it in the morning; we supposed it was the effect of the cheese. However we got on very well till we reached the small stream before mentioned. This time we had no one to carry us over, our guides having deserted us as soon as they had received their Buch-

sheesh. I managed to get over without even wetting my toes or any part of me, by lying full length on my donkey. L's courser went very well till he got to the middle and deepest part of the stream, and then began, with the greatest coolness possible, to turn round and round; this manœuvre he persisted in, and we could not induce him to proceed by fair means or foul for some time. C. nearly tumbled in, but saved himself, and escaped with getting wet through to the waist. This, however, terminated our adventures, and we reached home, or rather our hotel, safely at five o'clock in the afternoon. We did not allow ourselves more than a short rest, when, having procured fresh donkeys, we started for the company's office, where we were told that we were not to leave Cairo till ten o'clock in the evening of the ensuing day.

We had thought we had only this day to stay, and were accordingly not a little rejoiced at this further rest. The remainder of the evening was spent in visiting the Turkish market and wandering through various parts of the town. At eight we returned to our hotel to dinner, immediately after which, wearied and way-worn, we retired comfortably to the arms of Morpheus.

23d.—Breakfasted at nine; the same six mounted again and started for the slave market, which is about three miles off; we arrived there in good time, and saw the slaves confined in most miserable holes. There were, in the first place, about two dozen Abyssinian boys from ten to eighteen years of age, the ugliest creatures I ever beheld; and then two or three girls of the same breed, and if possible uglier still,—a rather pretty little Nubian, not at all unlike an East Indian, but too dark; and that was all of the sad collection.

The whole of us were thoroughly disgusted, and stayed no time, especially as the merchants wanted us to buy, for our dragoman had brought us in under the pretence that we wished to purchase, as we should not have gained entrance under any other pretext.

Retreating as fast as possible from this shocking sight, we went to the oldest mosque in Cairo, built soon after the death of Mahommed. It is a beautiful building, and must have been splendid in former times, though now rather dilapidated. Among other curiosities it contains two very hard black stones, about eight feet square, on one of which are the marks of a man's hands, on the other of his feet. Our dragoman told us that it was impossible to cut these stones with any instruments, and that these marks were those of the hands and feet of Mahommed. Of course we said nothing, and there were the marks quite evident, how done it is not for me to say, as I don't pretend to know. From the old mosque we rode all through the town, and saw a magnificent new mosque which the Pacha is building, and in which he is to be buried. It is the largest in Egypt, and is to consist almost entirely of white marble. From this we went to the Pacha's menagerie, a miserable affair, consisting of two lions, two lionesses, a leopard, a lynx, and two hyenas. The animals are fine, but the cages wretched; one of the lions had comfortably eaten his keeper two days before; but that, of course, is thought nothing of in Egypt,—at least our dragoman and the surviving keepers troubled themselves very little about it! The animals seemed all very savage, this lion especially.

The Pacha's palace, which is open to travellers, was the next lion we went to see. It is, on the whole, rather a handsome building, though some of the rooms are tawdry to a degree; a few however are very fine. We also saw the old worthy's bed, and his bath, which still contained the water in which he had washed himself that morning; by the bye, it was rather dirty than otherwise.

From the palace we went and examined mosques and other places of little note; but, as we had determined to see all that was to be seen, we of course omitted nothing. After this survey we bent our steps to the Turkish market, where we bought pipes, tobacco, red caps, and

slippers to a frightful extent; and from thence to our hotel, where we had to liquidate our account, and were charged for two days and nights, for one miserable room, with two beds between four, and very wretched fare, 5*l.*, which proves that hotel keepers in Egypt, as well as in other places, know how to take care of themselves. Having disbursed our cash, we betook ourselves to the British, where F. and L. had rooms, and where we dined with them at eight. We were to start by the carriage at ten, and till then we enjoyed ourselves indoors. By the bye, I forgot to say that, as we were returning from our sight-seeing to our hotel about five p.m., we met, in an English carriage drawn by six beautiful horses, the old Pacha himself attended by his officers, the whole of them splendidly mounted and magnificently dressed. We all drew up our donkeys and took off our caps, to which he responded by a very polite bow to each of us. He is very polite to the English, always, if possible, taking notice of them. I wonder what Queen Victoria would have thought of us, her liege subjects, on donkey-back.

Ten o'clock arrived at last, and each taking his small bundle we proceeded to the company's office, not more than two minutes' walk from our hotel, and took our seats in our carriage. The transit over the Desert is managed in the following manner. There are generally four different times of starting, though sometimes more, sometimes less, according to the number of passengers. With us I think it was six times, and four carriages at each starting, each vehicle containing six persons. One set started at two that morning, the next at six, then again at ten a.m., at two p.m., at six, and the last at ten.

In my vehicle there were the full complement, six—that is myself and the five others who had the honour of my company to the Pyramids. Luckily, we had no ladies with us. The carriages are drawn by four horses, and, besides the driver, there is a sort of cad behind, who helps to harness the horses at the different stations, and to hold their heads when they stop, which they are obliged to do every fifteen minutes. The drivers are most of them detestable, and the cattle very bad; for, as there are seven stations in the Desert, and ten miles between each, it is no joke for the animals to pull all that distance through such roads as the Desert presents. Of the vehicle itself I can give no other or better description than that it is exactly like a bathing machine, having two wheels instead of four, as one would naturally anticipate, and drawn by four horses. And in this extraordinary affair we left Cairo, with great grief and sadness of heart, for it is undoubtedly a splendid town, and we had passed our time very pleasantly there; but the hour was come, and here we were—

"Six precious souls, and all agog
To dash through thick and thin."

It was a beautiful night, and we went off in good style, for the horses were quite fresh, which was a great mercy, as at the other stations we were only to get those which had pulled the other passengers across before us. We got through these first ten miles pretty well, though the veritable Desert begins almost immediately on leaving Cairo. No doubt we had a stoppage every now and then to give the horses rest, for they were forced to go full gallop all the way. When they halted, the exquisite behind jumped down and held their heads till they were to start again, and then his pleasing duty was to haul them along for about five minutes, and then we had to trust to Providence and the driver for the rest. We accomplished the first stage in about two hours and a half; our carriage being second in the race. The stations are miserable barn-like affairs, all under the care of those Egyptian rascals. The half hour we stayed there would have passed pleasantly enough could we but have passed it in sleep, but all we could do none of us could manage to effect this.

It is in vain to attempt to describe the miseries which we underwent in the course of our next stage; we were four hours going these ten miles, four weary hours, and sleep we could not, for the horses got quite knocked up half-way, and one of them was obliged to be taken out, and made over to our cad, who was to lead it to the station, whilst we ourselves, by way of variety, were obliged to get out by turns, and actually pull the unhappy beasts along while the driver thrashed them. We were, however, no worse off than our neighbours, for one of the other conveyances, in which was a sick lady, was nearly upset by a kicking vicious horse.

However, no accident did actually occur, and, at five o'clock in the morning of Tuesday, 24th, we reached the second station, perfectly worn out with fatigue; here we got a tolerable breakfast, and started again at half-past seven.

The next stage was the same length as the former, but our carriage was not so badly off for cattle as another one, which was occupied by five ladies and but one gentleman; and he, unfortunate individual, was obliged to run by the side of the horses for two hours with a bit of rope, and thrash them along; but all things come to an end—we reached the station at half-past twelve. Quick travelling, ten miles in five hours!! As for the carriage I have just mentioned, it did not appear for two hours after the other three. The instant we arrived we rushed out of our carriage, and put on the clean linen which we had with us; and, as we stayed at this oasis four hours, we had time to dine, and walk about and stretch our legs, none of the shortest, after our morning's drive.

Just as we were starting again, up came a new carriage, with five horses, and in it wore lords, and other great personages.

This party proposed taking our horses from us, but to this obliging proposition we would not consent; they succeeded, however, in persuading the occupants of another carriage to lend them theirs, as his lordship wished to travel as fast as possible. We all started together, and this stage was accomplished in good style; we reached the next station by half-past one, and were first in.

Changed horses; set off again, but fortune was not propitious—very bad cattle, one lame, another completely knocked up before we had gone over half our ground; we had to get out and pull the miseries along, and with the greatest exertion reached the next station by eight o'clock. This had been the worst pull of all, the road in this part being the heaviest in the Desert, and another bathing machine besides ours was obliged to leave a horse behind, it was almost dead.

Here we rested long enough to allow me to get a sleep of two hours, a blessing I had not enjoyed, or in fact any one of my companions, since Sunday night. After this refreshment, we got a cup of tea, the horses were ready, and we started. The night before, notwithstanding all our miseries, had been fine, but this was, if possible, still finer, and, all the vans somehow having good beasts, we went along something like, and all managed to keep together, which we had never done before. Ours was the last conveyance but one; that before us had in it three gentlemen, two of them juveniles, and the other an old Hibernian Medico, with his wife and the afore-said invalid young lady. Well, time wore on. Midnight came, every individual in my van was asleep except myself, and I was just nodding, when I was startled by a sort of scream proceeding from the carriage in front. I jumped up, looked out of the window, and, to my astonishment, saw the vehicle in question, not attacked by romantic and ferocious robbers, Ma'am, like those interesting Arabs who carried off the adorable Pekuah, lady's maid to the lovely Nekayah, sister of Rasselas, Prince of Abyssinia, as is related in that delightful tale, which we studied with equal pleasure and profit in days of yore, but—upset. Being next the door I popped out, and found that luckily no one

had sustained any damage except the poor driver, who was nearly killed. The sick young lady had fallen into a gentleman's arms, but neither of them were hurt; the other young man was quite safe also, Mrs. W. had got two black eyes instead of blue, and her worthy spouse had nearly broken his nasal organ; this calamity was averted, but the side of the carriage was smashed by his tumbling against it.

There was a tremendous row for some time, but we six youths, like good knights and true, having offered to make over our carriage to the wounded, and to take their broken one, every thing was put to rights. The driver, having fallen asleep as well as the passengers, had in his dreams driven over a stone at least three feet high, which caused the upset. C. got into his lordship's carriage, and one of its passengers, who was an expert whip, got on our box and drove us, our unfortunate Jehu being so very much hurt that we took him inside, and left him at the next station where we changed horses.

The carriage was dreadfully broken and rather dangerous; none of us, however, cared for that; we were so thoroughly knocked up that, in fifteen minutes after we had started, I do not believe a soul in the carriage was awake; nor did any of us open our eyes till the vehicle stopped at the next station; so how we got there I cannot tell, but right glad were we to find ourselves so near the end of our journey. Here we breakfasted, and again started, and, insensible to the beauties of nature, slept as soundly as before, not only through this stage but through the next, and, by nine o'clock of the 25th, Christmas Day, reached that disgusting dirty hole of a place, called Suez, stayed half an hour, which was half an hour too long, got a boat as soon as practicable, and set off the whole party of us for the steamer, which we reached at noon; and rejoiced were we all when we put foot on board the Peninsular and Oriental Steam Navigation Company's steamer, the *Bentinck*, bound for Calcutta, then lying in the Red Sea.

DANGERS OF THE ARCTIC SEAS.—LOSS OF H. M. S. FURY IN 1825.

THERE is perhaps no situation, short of absolute wreck, in which a ship can be placed, so calculated to impress the mind with danger, as when closely beset by ice. Captain Parry's third voyage in search of a north-west passage was undertaken in the year 1824. The ships *Hecla* and *Fury* sailed on the 10th of May, and having crossed the Atlantic, entered Davis's Straits. The obstructions from the quantity, magnitude, and closeness of the ice kept the crews almost constantly employed in heaving, warping, or sawing through it; and yet with so little success, that, at the close of the month of July, they had only penetrated seventy miles to the westward, or to the longitude of about $62^{\circ} 10'$. Here, while closely beset, on the 1st of August, they encountered a hard gale from the south-east, which pressing the ice together in every direction, by mass overlaying mass for hours in succession, the *Hecla* received several very awkward nips, and was once fairly laid on her broadside by a strain which must have crushed a vessel of ordinary strength. In such cases, the ice is forced under a ship's bottom, on one side, and on the other up her side, both powers thus acting in such a manner as to bring her on her beam ends. Captain Parry remarks that this is, in fact, the most favourable manner in which a ship can receive the pressure, and would perhaps only occur with ice comparatively not very heavy, though sufficiently so to have run completely over a ship in some extreme and fatal cases. With ice of still more formidable dimensions, a vessel would probably, by an equal degree of pressure, be absolutely crushed,

in consequence of the increased difficulty of sinking it on one side, and causing it to rise on the other.

Thus the crossing of the ice in Baffin's Bay occupied nearly the whole of one season, and the middle of September had nearly arrived before they entered Lancaster Sound. Winter closed in upon them, and they had to make arrangements for security and comfort during that long and dreary season, without having made any geographical discovery to reward their anxieties and toils.

The following spring was unusually favourable, so that they were able to get out to sea by the middle of July, 1825. The sea was, however, encumbered by ice, among which they continued to work till the end of the month, when they reached the latitude of $72^{\circ} 42'$, longitude $91^{\circ} 50'$. A gale of wind, rising up, brought the ice closer and closer, till it pressed with considerable violence on both ships, but most upon the *Fury*, which lay in a very exposed situation. The *Fury* was forced aground, but was hove off at high water; a broad channel of water appearing at a short distance, and a fresh breeze springing up, the ships were directed towards it, in the hope of gaining the broader channel before the ice closed. So sudden and rapid, however, was the motion of the ice, that it again hemmed in the ships in such a manner as to leave them literally helpless and unmanageable.

"In such cases," says Parry, "it must be confessed that the exertions made by heaving at hawsers, or otherwise, are of little more service than in the occupation they furnish to the men's minds under circumstances of difficulty; for, when the ice is fairly acting against the ship, ten times the strength and ingenuity could, in reality, avail nothing."

The sails were however kept set, and as the body of ice was setting to the southward, the ships drifted with it some little distance in that direction. The *Hecla*, being quite close to the shore, at length struck the ground forcibly several times in the space of a hundred yards, and then remained immovable. The *Fury* continued to drive on, and was within a few feet only of being dashed against the *Hecla*. She had not gone above two hundred yards further before she was observed to receive a severe pressure from a large floe-piece forcing her directly against a grounded mass of ice upon the beach. The effect of this was to open a leak, and to otherwise damage the ship. Captain Parry examined the shore in the hope of finding a small harbour, in which to shelter the ships until the ice, by drifting off, should leave the sea more open. The whole shore was more or less lined with grounded masses of ice; and, after examining the soundings within more than twenty harbours in the space of about a mile, he found only two that would allow the ships to float at low water. Having fixed a flag on each berg, the usual signal for the ships taking their stations, he rowed on board the *Fury*, and found four pumps constantly going, to keep the ship free, and Captain Hoppner, his officers, and men, almost exhausted with the incessant labour of the last eight-and-forty hours. It was evident that the *Fury* could proceed no further without repairs, and that the nature of those repairs would probably involve the disagreeable necessity of heaving down the ship. On further examining the beach, a place was found where three grounded masses of ice, having from three to four fathoms of water at low tide within them, were so disposed as to afford something like shelter. "Wild and insecure, as, under other circumstances, such a place would have been thought for the purpose of heaving a ship down, we had no alternative, and therefore as little occasion as we had time for deliberation. Returning to the ships, we were setting the sails in order to run to the appointed place, when the ice closed in and prevented our moving, and in a short time there was once more no open water to be seen. We were, therefore, under the necessity of remaining in our present berths, where the smallest external pressure

must inevitably force us ashore, neither ship having more than two feet of water to spare. One watch of the Hecla's crew were sent round to assist at the Fury's pumps, which required one-third of her ship's company to be constantly employed at them." In this laborious occupation the men's hands had become so sore from the constant friction of the ropes, that they could hardly handle them any longer without the use of mittens, assisted by the unlaying of the ropes to make them soft. It was evident that no time was to be lost: advantage was therefore taken of a small lane of water deep enough for boats, which kept open within the grounded masses along the shore, to convey to the Hecla some of the Fury's dry provisions, and to land a quantity of heavy iron-work and other stores not perishable, in order to lighten the ship.

The wind blowing fresh from the northward, there was considerable danger of the ships being forced adrift. The 4th of August was occupied in landing stores. On the 5th, the ice began to slacken near the ships, and the intended harbour was again examined. One of the three bergs had shifted its place so materially, as not only to alter the disposition of these masses, on which the safety of the ships so greatly depended, but also to destroy all confidence in their stability upon the ground. Both the ships, however, managed to get into this ice-harbour, and, within twenty minutes after their arrival, the whole body of ice again came in, entirely closing up the shore, so that the ships' moving forward proved most opportune.

All hands were next employed in guarding against the incursions of the ice. Anchors were carried to the beach, having bower cables attached to them, passing quite round the grounded masses, and thus enclosing a small space of just sufficient size to admit both ships. The cables were floated by means of hand masts, and some empty casks lashed to them as buoys, with the intention of thus making them receive the pressure of the ice a foot or two below the surface of the water. This laborious work was completed before night, and all the tents were set up on the beach for the reception of the Fury's stores.

Every one was now engaged in landing stores, or some other employment preparatory to the heaving down of the ship. Even the dogs were set to work to drag up the stores on the beach, so that the little dock-yard soon exhibited the most animated scene imaginable. The quickest method of landing casks and other things not too weighty, was found to be by a sort of inclined plane, formed by a hawser secured to the ship's main mast-head, and set up as tight as possible to the anchor on the beach. The Fury was so much lightened in the course of the day, that two pumps were nearly sufficient to keep her free. Her spirit room was now entirely clear, and on examination the water was found to be rushing in through two or three holes that happened to be in the ceiling, and which were immediately plugged. At night, just as the people were going to rest, the ice began to move, and soon after came in towards the shore, endangering the Fury's rudder and pressing her over on her side to so alarming a degree, as to show how imprudent it would be to lighten her much more in her present insecure situation. Still, however, there was no choice; the Fury was unrigged, her spars, sails, booms, boats, and other top-weights landed, as were also the coals and provisions. These operations were sadly interrupted by the loose ice choking up the basin from time to time, and this had to be cleared out piece by piece. When the water was sufficiently smooth, the nature of the Fury's damage could to a certain extent be examined. It was discovered with pain that the stern-post and fore-foot were broken and turned up on one side with the pressure; the main keel was also much torn, so that there was every reason to conclude that the damage would altogether prove very serious.

The precautions necessary to be taken against the assaults of the ice, did not allow them completely to

clear the Fury before the 16th. "Though we purposely selected the time of high water for turning the ship round, we had scarcely a foot of space to spare for doing it, and indeed, as it was, her fore-foot touched the ground, and loosened the broken part of the wood so much as to enable us to pull it up with ropes, when we found the fragments to consist of the whole of the 'gripe' and most of the 'cut-water.' The strong breeze continuing, and the sea rising as the open water increased in extent, our bergs were sadly washed and wasted; every hour producing a sensible and serious diminution in their bulk. As, however, the main body of ice still kept off, we were in hopes, now that our preparations were so nearly completed, we should have been enabled in a few weeks to see the extent of the damage, and repair it sufficiently to allow us to proceed. In the evening we received the Fury's crew on board the Hecla, every arrangement and regulation having been previously made for their personal comfort, and for the preservation of cleanliness, and ventilation and dry warmth throughout the ship. The officers of the Fury, by their own choice, pitched a tent on shore for messing and sleeping in, as our accommodation for two sets of officers was necessarily confined."

On the 17th, when every thing was completed for heaving down the Fury, the cables were found again so slack by the washing of the bergs, that several hours were occupied in putting them to rights. This work being finished at ten o'clock at night, the people were allowed three hours' rest only, it being necessary to heave the ship down at or near high water, as there was not sufficient depth to allow her to take her distance at any other time of tide. When every thing was ready, on the 18th, it was found that the straps had stretched so much that they could not bring the keel out of water within three or four feet. She was therefore cased up again and hauled further in shore, so as to make a less depth of water necessary; "and we were then in the act of once more heaving her down, when a snow-storm came on, and blew with such violence off the land, as to raise a considerable sea. The ships had now so much motion as to strain the gear very much, and even to make the lower masts of the Fury bend in spite of the shores; we were therefore most unwillingly compelled to desist until the sea should go down, keeping every thing ready to recommence the instant we could possibly do so with safety. The officers and men were now literally so harassed and fatigued as to be scarcely capable of further exertion without some rest; and on this and one or two other occasions, I noticed more than a single instance of stupor amounting to a certain degree of failure in intellect, rendering the individual so affected quite unable at first to comprehend the meaning of an order, though still as willing as ever to obey it. It was therefore perhaps a fortunate necessity which produced the intermission of labour, which the strength of every individual seemed to require."

The gale continuing during the whole of the 18th, so destroyed the bergs on which the ships solely depended for shelter from the assaults of the ice, that they no longer remained aground at low water; the cables had again become slack about them, and the basin which had been formed with so much trouble had now lost all its defences, at least during a portion of every tide. "After a night of most anxious consideration and consultation with Captain Hoppner, who was now my messmate in the Hecla, it appeared but too plain that, should the ice again come in, neither ship could any longer be secured from driving on shore. It was therefore determined instantly to prepare the Hecla for sea, making her thoroughly effective in every respect; so that we might at least push her out into comparative safety among the ice, when it closed again, taking every person on board her, securing the Fury in the best manner we could, and returning to her the instant we were able to do so, to endeavour to get her out,

and to carry her to some place of security for heaving down. If, after the Hecla was ready, time should still be allowed us, it was proposed immediately to put into the Fury all that was requisite, or at least as much as she could safely carry, and towing her out into the ice, to try the effect of 'foddering' the leaks by asis under those parts of her keel which we knew to be damaged, until some more effectual means could be resorted to."

By dint of great exertions the Hecla was prepared for sea, and on the 20th the reloading of the Fury commenced, such articles being selected for putting on board as were essentially requisite for her re-equipment. A few hands were spared to prepare a sail for putting under the Fury's keel, in order to relieve the men at the pumps, which constantly required the labour of from eight to twelve hands to keep her free. By a lengthened day's labour fifty tons weight of coals and provisions were got on board the Fury, which were considered sufficient to give her stability. "While we were thus employed, the ice, though evidently inclined to come in, did not approach us much; and it may be conceived with what anxiety we longed to be allowed one more day's labour, on which the ultimate saving of the ship might almost be considered as depending." Having hauled the ships out a little from the shore, and prepared the Hecla for casting off by a spring at a moment's notice, all the people, except those at the pumps, were sent to rest, which, however, they had not enjoyed for two hours when a heavy mass of ice coming violently in contact with the bergs and cables, threatened to sweep away every remaining security. Nothing but the urgency and importance of the object in view, that of saving the Fury, if she was to be saved, could have prevented Captain Parry from making sail, and keeping the Hecla under way till matters mended. Some hawsers were run out, which enabled them still to hold on, all hands were then set to work to get the Fury's anchors, cables, rudder, and spars on board; these things being absolutely necessary for her equipment. At two o'clock P.M. several masses of ice drove along the shore at a quick rate, and coming in contact with the Hecla or the bergs to which she was attached, made it evident that very little additional pressure would tear everything away, and drive both ships on shore. The Hecla was therefore immediately got under sail, and stood out to sea. Captain Hoppner, and as many as could be spared, were busily engaged in getting the anchors and cables on board the Fury, when Captain Parry observed some large pieces of ice closing in with the land near her, and he was shortly after informed by signal that the Fury was driven on shore. She appeared to have been driven up the beach by two or three of the grounded masses forcing her onwards before them, and these, as well as the ship, seemed now so firmly aground, as entirely to block her in on the seaward side. In the evening, Captain Hoppner returned to the Hecla, accompanied by all hands, except an officer with a party at the pumps. It appeared that, in the present state of the Fury, nothing short of chopping and sawing up a part of the ice under her stern could by any possibility have effected her release, even if she had been already afloat. A strong current swept the Hecla a long way to the southward, while hoisting up the boat, so that Captain Parry was under the painful necessity of recalling the party at the pumps, rather than incur the risk of parting company with them altogether. A few hours after the last of the people had come on board, more than half a mile of closely packed ice intervened between the Fury and the open water, in which the Hecla was beating, and before morning this barrier had increased to four or five miles in breadth.

The Hecla continued to beat about in the neighbourhood of the Fury, but in consequence of contrary winds was separated from her several leagues. Being impatient to obtain a sight of her, and the wind becoming light, Captain Parry left the Hecla in a boat, and reached the Fury about three-quarters of an hour before

high water, being the most favourable time of tide for arriving to examine her condition. The first hour's inspection convinced him that, exposed as the ship was, and forcibly pressed up upon an open and stony beach, "her holds full of water, and the damage of her hull to all appearance more considerable than before, without any adequate means of hauling her off to seaward, or securing her from the further incursions of the ice, every endeavour of ours to get her off, or, if got off, to float her to any known place of safety, would be at once utterly hopeless in itself, and productive of extreme risk to our remaining ship."

Captain Parry then ordered a careful survey of the ship to be made, which was accordingly done, and the carpenter of the Fury reported "that it would occupy five days to clear the ship of water; that if she were got off, all the pumps would not be sufficient to keep her free, in consequence of the additional damage she seemed to have sustained; and that, if even hove down, twenty days' work would be required to make her seaworthy." Captain Hoppner, and the other officers, were, therefore, of opinion that an absolute necessity existed for abandoning the Fury. "My own opinion," says Parry, "being thus confirmed as to the utter hopelessness of saving her, and feeling more strongly than ever the responsibility which attached to me of preserving the Hecla unhurt, it was with extreme pain and regret that I made the signal for the Fury's officers and men to be sent for their clothes, most of which had been put on shore with the stores." The officers and men were allowed an hour for packing up their clothes, or what else belonging to them the water in the ship had not covered. The whole of the Fury's stores were left either on board her, or on shore, every spare corner that could be found in the Hecla being absolutely required for the accommodation of the double complement of officers and men.

"When the accident first happened to the Fury," says Captain Parry, "I confidently expected to have been able to repair her damages in good time to take advantage of a large remaining part of the navigable season in the prosecution of the voyage; and, while the clearing of the ship was going on with so much alacrity, and the repairs seemed to be within reach of our means and resources, I still flattered myself with the same hope. But, as soon as the gales began to destroy, with a rapidity of which we had before no conception, our sole defence from the incursions of the ice, as well as the only trust-worthy means we before possessed of holding the Hecla out for heaving the Fury down, I confess that the prospect of the necessity then likely to arise for removing her to some other station was sufficient to shake every reasonable expectation I had hitherto cherished of the ultimate accomplishment of our object. Those expectations were now at an end. With a twelvemonth's provisions for both ships' companies, extending our resources only to the autumn of the following year, it would have been folly to hope for final success, considering the small progress we had already made, the uncertain nature of this navigation, and the advanced period of the present season. I was therefore reduced to the only remaining conclusion, that it was my duty, under all the circumstances of the case, to return to England, in compliance with the plain tenor of my instructions. As soon as the boats were hoisted up, therefore, and the anchor stowed, the ship's head was put to the north-eastward, with a light air off the land, in order to gain an offing before the ice should again set in-shore."

Captain Parry further remarks on the loss of the Fury, that "to any person qualified to judge, it will be plain that an occurrence of this nature was at all times rather to be expected than otherwise, and that the only real cause for wonder has been our long exemptions from such a catastrophe. I can confidently affirm, and I trust that on such an occasion I may be permitted to make the remark, that the mere safety of the ships has

never been more than a secondary object in the conduct of the expeditions under my command. To push forward while there was any open water to enable us to do so, has uniformly been our first endeavour: it has not been until the channel has actually terminated, that we have ever been accustomed to look for a place of shelter, to which the ships were then conducted with all possible despatch; and I may safely venture to predict that no ship acting otherwise will ever accomplish the North-west Passage."

The stores of the *Fury*, thus abandoned on these barren and desolate shores, seem to have been providentially ordained to be the means of saving the lives of Captain Ross and his crew a few years later. It will be remembered that in 1829 Captain Ross, with the aid of his friends, equipped and provisioned the steam-vessel *Victory*, for the purpose of attempting the discovery of the North-west Passage, it being understood that government had relinquished the intention of fitting out another expedition. The *Victory* left England in June 1829, reached Davis's Strait in July, and Lancaster Sound in August; no impediment was found in gaining the western side of Prince Regent's Inlet, and from that side to the beach where the *Fury* had been wrecked; but the vessel had entirely disappeared, it having either gone to pieces or been sunk. The tent poles, however, were still standing, and the vast heaps of casks, cases, and canisters were observed to be piled up, and on landing all found to be entire. The *Victory* was therefore moored, in order to put on board her as much bread, flour, wine, spirits, sugar, cocoa, &c. as she could stow, after which the heap is said to have been scarcely diminished.

The *Victory* was also lost in these dangerous seas; and, during four years, Captain Ross and his crew were imprisoned here, deprived of all means of escape, and must have perished, but for the stores of the *Fury*. It will be remembered that Captain Back nobly volunteered to go in search of the *Victory*, and had actually started on his journey when the news arrived that Ross and his companions had been rescued by a whaler, which had been tempted by the fineness of the season farther north than usual.

THE WANDERER'S RECEPTION.

CHAPTER V.

MARY determined to show the baby at the parsonage when she came back from the Hall, and left the old man at the gate. Trust seemed to understand that he had a double charge to-day, and walked quietly by her side. The hum of the insects seemed to lull the baby to sleep, and her little bright eyes were soon closed. The young nurse felt quite proud of her charge, and, when she arrived at the Hall, was too impatient to show it to Ellen to stop at Mrs. Adams's room, but went directly to the study window. She had lost much of her fear of Anna, and, when she found her alone, busy with her needle, she displayed her treasure with the greatest satisfaction; but this did not satisfy Mary, for she had determined to have Miss Stanmore's opinion.

"I do not know what my cousin is about this morning, Mary; I wished her to come and help me to work at these clothes for a poor family, whose father is out of health, and cannot walk; but she said something about having some letters to write, and I have not seen her the whole morning."

"I am sure Miss Stanmore must have some good

reason for not helping you; I hope she will come down before I go."

"I think it most likely that she will; she mentioned a wish of walking to the parsonage, and my aunt will want us both to go out with her this afternoon, which I do not at all like, as I wish to finish this little frock."

"You seem very busy, and I wish I could help you. You must feel very happy at being able to assist poor people."

"I am, indeed; and I feel quite repaid when I see them all neatly dressed, and know that I have contributed to it. I have not so large an allowance as Ellen, but I have quite enough to do good with. I shall some day make a frock for Bessie."

This promise pleased Mary very much, but she felt very sad at the thought that she could not give presents to the poor, and for the moment, envied her companion's riches.

After waiting some time, Ellen came down ready for the walk; she was much interested in Mary's news, and in the baby, and regretted she had not time to stop and nurse it. She proposed going back with them to the parsonage, and wished to know if her cousin were inclined to accompany them; but Miss Francis decided that she was too much engaged to leave the house, however delightful the day might be. As they walked along the road, Mary told Ellen what had passed before she came into the study, and warmly praised Anna for her charity. She was surprised to find Ellen, who was generally so eager to speak well of every one, silent; she seemed anxious to change the conversation, and, cheerfully thanking Mary for so kindly believing that she had some good motive in not helping with the work, called her attention to some other subject, and they talked agreeably till they arrived at the parsonage. As they entered the hall, their good clergyman met them, and told Mary that Robert was in the parlour, but that he should be glad to speak with her in his own study. He was too much beloved by those who know him, for her to feel afraid of him, but, when she saw Miss Stanmore did not intend to go with her, she begged she would do so.

"If I may, Mary, I shall be very glad, as I have a little business of my own to transact with Mr. Beverley."

They were all soon seated in the little room, where so many came for counsel and consolation. Mr. Beverley explained to Mary that his reason for wishing to see her was to mention Robert's desire of having his grandchild baptized the next day, and to make her fully understand the duties and privileges of this holy sacrament. It was, he said, the greatest of all blessings that could be bestowed upon the child, and one, of which all who have been received into Christ's flock have equally been made partakers.

Mary sincerely felt the awful importance of what Mr. Beverley said. Ellen Stanmore had often conversed with her concerning her baptism, but had attached so much reverence to the subject, that it was seldom mentioned during their casual meetings. Mary now rejoiced that she could understand it better than she had ever done before, and believed that she should feel still deeper affection for little Bessie when she had been baptized. Mr. Beverley engaged Miss Stanmore to act as sponsor with Mrs. Beverley, to which, after some further conversation, she consented.

"And now," added Ellen, after some minutes' silence,

"I must beg for your attention to my business. On your recommendation I went to visit the poor labourer who has so long been ill; I find that he and his family are in the greatest distress; I wish to do them some permanent good, and should be glad if you could find out the best way of sending the poor man to town for advice. I have written to my friends to try and procure a situation for the eldest girl, and shall place a fund in your hands for the son. If he could be assisted a little at first, he might gain something towards the maintenance of his mother. I have also sent notes to some of my friends to interest them for him, and to persuade them, if possible, to give him employment. We can easily, for a time, support the others. My cousin Anna is even now busy making clothes for the children."

Mary had been engaged with the baby, who was just awake, but heard enough of what passed to admire the quiet way in which this liberality had been offered. She had been convinced that Miss Stanmore was not really so indifferent to this poor family's welfare as she had appeared to be, and she rejoiced to find that she had not misinterpreted the conduct of her friend. She was, however, surprised to find that Mr. Beverley passed over this kindness without noticing it, simply promising to lose no time in attending to Miss Stanmore's wishes. But she had not much time for these reflections, for Ellen, who knew how valuable her friend's time must be, hastened to leave him to follow his duties.

When they left the room she made Mary stop, and inquired what clothes the child most needed. "I wish," she said, "to give some work to a poor woman, and shall be glad to benefit two instead of one. I shall send you a new frock for the baby to wear to-morrow. As I am going into the town to-day, I shall leave it on my way home."

Mary knew the child had no good clothing, and was rejoiced to think she could bring it to church neatly dressed. They now joined Robert, who thanked Ellen with much feeling when he found that she had promised to become his child's godmother. They talked for some little time together, and Mary rejoiced to see them acquainted. In the evening, Mrs. Stanmore's carriage stopped at Robert's little cottage, and Ellen left the frock; Anna then asked whether the child had a cap; and when she found it had only a very common one, expressed her regret that she had not bought one; and told Mary that she would give her the money if she would manage to get it. "I do not know," said Miss Francis, "exactly what it will cost; but what is over you may keep to buy something for yourself." Mary eagerly promised to try; and, when she had put Bessie in her cradle, she hastened to her aunt's, to see if her uncle or one of her cousins would go with her to the town. Martha promised to go and take care of the child, and James kindly arranged to go with her himself. He begged for his father's cart; and they were soon on their road. Miss Francis had been very liberal, and Mary had never before had so much money. The discovery of Ellen's recent charity had made a deep impression upon her; and, after many struggles with her desire to get a very pretty cap for her little darling, she determined to spend only part, to be content with a plain one, and devote the rest of the money to the good of others; she was surprised to find that her resolution, when once formed, did not give way, not even in the shop, where many pretty caps tempted her; but her greatest trial was James's thinking her stingy; she would not explain her motives, but felt vexed at his having such an opinion of her. However, even this could not take away her satisfaction as she rode home with the cheaper cap, and some few shillings remaining. She was very tired, yet still talked so gaily to her cousin, that the way home seemed much more delightful than the way to the town. Before she went to bed, she laid the young ladies' presents ready for the baby the next morning. She felt fearful that Miss Francis might remark that the baby was not so smart as she expected;

she scarcely knew what she should do with the money, but put it carefully into her pocket, and decided that she would consult Ellen on the best use to make of it. She tried to remember all that Mr. Beverley had said in the morning, and fell asleep in the pleasing conviction that the blessings sent her that day had afforded her instruction, and drawn her heart nearer to her Heavenly Father, whose angels, she loved to believe, were allowed to watch over her while she slept.

CHAPTER VI.

MARY awoke the next morning with confused ideas of the events of the preceding day, but a cry from Bessie instantly recalled her full recollection of what was to take place. Robert was already engaged in making the cottage neat; Mary joined him; and they had soon completed their arrangements for the day. Little Bessie lay in her cradle, watching them move about, as if they had done so on purpose to amuse her, and crowded with animation as Mary dressed her. When she had quite completed this duty, she carried her to her grandfather, expecting him to praise her new clothes, which seemed to Mary to make her look prettier than ever; but he scarcely noticed them, and looked so sad and grave that she did not like to ask him any questions, but ventured to inquire if he did not consider Bessie would be as much benefited as Mr. Beverley did.

"I do, indeed, my child; God gives us all the promise of heaven, for the sake of our Saviour, when we are baptized; but He also requires that we should perform the vows which in baptism we take upon us; which if we fail to do, doubtless we shall be in danger of forfeiting the abundant blessings of this holy sacrament. This makes me feel fearful and sad for her sake. Suppose, Mary, a great prince were to come and offer to adopt her as his child, and to promise that if she would obey his command, he would in time bestow upon her happiness beyond everything that she could imagine, do you not perceive that although she would be perfectly undeserving of such goodness—although it would be a perfectly free gift on his part—yet, that if she refused to obey, she would most deservedly lose it!"

Mary looked anxiously in the old man's face, and softly whispered, half afraid of her own fears, "Do you not think that she will be a good child, and go to heaven; for I know that is your meaning in the story of the prince?"

"We will trust and pray that she may, if she is taught to turn entirely to God for assistance, and really try to please Him in everything; she might, in time, become as good as those saints and holy people of whom we read in the Bible."

Mary was willingly comforted about her little darling, who seemed then too innocent to learn wickedness.

The party from the farm soon arrived, and they all walked together to the church, where they were to meet Mrs. Beverley and Miss Stanmore. Mary's uncle was Bessie's godfather, and went with Robert; Miss Francis had also joined the party. Mary carried the child, who slept quietly until the end of the Second Lesson of the Morning Service; and then, as if she knew the hour had arrived, opened her eyes, and looked with confused wonder on all around her. As they stood at the font, Mary's fears vanished; and when Ellen firmly answered the solemn questions put to the sponsors, she felt no desire to shrink from the duties which she would owe to her charge. Mr. Beverley took Bessie in his arms, sprinkled her with water, marked on her the sign of the cross, and giving her back to Mary, knelt in prayer for their new member. As they were leaving the church, Mary noticed Ellen Stanmore turn aside and quietly slip some money into a box, over which was written, "Give alms of thy goods, and never turn thy face from any poor man." The action was not noiced by any one except her little friend, who had kept close by her side, with Bessie in

her arms. The thought struck Mary that perhaps she might thus apply the money which remained over after the purchase of the cap; but still she felt that she should like to know what good she had done, and this desire was increased when she reached the porch of the church. The family of the poor labourer were standing round Miss Francis, thanking her for her goodness, and she seemed quite delighted. A respectful curtsy was dropped to Ellen; but Mary foolishly regretted that it was not known that she had even been a greater benefactor than Anna. Ellen seemed to have no desire to share in the praises to which her cousin was listening, but quietly smiling to the children, and making inquiries after sick relations of the poor villagers, who were collected in the church-yard, she passed on without a sign of anxiety concerning the reception which each group gave her; and the whole party went to Mr. Beverley's, where they were to rest.

Old Robert seemed now quite cheerful, and was anxious to show Miss Stanmore as much attention as he could. Little Bessie was caressed and played with by all; the child was quite delighted, clapped her little hands, and laughed so joyously, that none could refrain from noticing her. Anna took her in her arms, and Mary's heart beat as she thought of the secret of the cap. The little frock was very neat and simple, and the cap corresponded; but Anna had thoughtlessly, yet from good nature, wished her present to be a handsome one. She observed, in a disappointed tone, that the work was not very fine. Mary's cheeks were instantly tinged, and she felt like a culprit; she did not like to explain it, but deeply lamented that all should have so unpleasant a suspicion of her, for she was sure they must think that she had spent the rest of the money on herself. Her cousin James, who knew she had not done so, changed the subject by telling Mary to take the child from Miss Francis, who must be tired of nursing it; in assuring him that she was not, the subject was forgotten; but it was some time before Mary could feel comfortable, and she began to fear she had not done rightly in keeping back the money which had, in truth, been given to Bessie.

Before the christening party left their kind friend, they were invited to visit his garden, which was so prettily laid out, that although small, it seemed to contain all the attractions of space and culture. Mary soon contrived to show Ellen that she wished to talk to her, and while their elders were examining the beauties of the green-house, they turned into a quiet, shady walk. Miss Stanmore had observed Mary's confusion when Anna noticed the plainness of the cap, and suspected that she should now have it explained, but she did not wish to intrude on the girl's motives; she was too charitable to accuse any one without just cause, and determined to wait patiently until her companion mentioned the subject. Mary was not long silent, for she knew she had not much time alone with her friend; she wished also to speak of the poor labourer's family; and looking inquiringly at Miss Stanmore, she asked why she did not wish them to know what she had done for them.

"I did not recollect, Mary, that you knew any of the circumstances; but I now remember that I spoke to Mr. Beverley when you were in the room."

Mary was afraid that she had done wrong in attending to what passed, but her friend instantly set her mind at rest, and asked her whether she would not like to be as rich as she was, and whether she thought the happiness she was blessed with arose from possessing so much money.

"I think," answered Mary, "that I should feel very happy if I were able to assist poor people; and I am sure you like to do good. Miss Francis told me yesterday that it was a great happiness to her to see how she benefited her fellow-creatures."

"My cousin only alluded to the comfort of being able to relieve the temporary wants of life; but do you not think there must be a higher pleasure than this?"

Mary thought for an instant, and replied, "You mean, that you please your Heavenly Father."

"You have nearly expressed my meaning; but can you tell me to whom these riches belong?"

"Yes; your father gives you a portion of what belongs to him, to use as you like best."

"My father, certainly, has the present power over the means placed in his hands, but he cannot consider his riches as his own. Had every one the power of obtaining them, we should find but few poor men. If we cannot control the distribution, therefore, can we consider that it depends on ourselves whether we have them or not? They are a trust, Mary, for which we are responsible, and we must take the most watchful care that they do not prove our greatest unhappiness."

Mary had never believed that wealth could bring misery; and told Ellen that she was sure it would add to her welfare to possess it.

"I have learnt to look upon my wealth as a trust from God; it brings heavy cares which you know nothing of. I am convinced that I ought merely to be God's instrument; that when others are benefited through me, the glory is His for so directing me. The poor are objects placed in our path to allow us the privilege of showing that we desire to be directed by God's Word."

"But it was your thought of trying to help the poor labourer to obtain advice in London?"

"Yes, I give him the means, but it does not come from me; I only have the blessing of labouring in my Maker's cause—it is no merit of mine."

"For the first time in my life," observed Mary, "I feel very thankful that I am not rich."

"But you must not forget that although wealth brings many responsibilities, it also causes great happiness. The true Christian feels that alms-giving is one of the purest joys allowed us on earth, and the rich are thus permitted to taste and exercise this delight."

"Then, I suppose, because you felt that you were not the benefactor of the labourer and his family, you did not care whether they knew that you had assisted them, and did not wish for all the thanks which they gave Miss Francis?"

"I see you understand me better now, Mary; Mr. Beverley, as a priest, is the best person to act with me in my important duties."

"And now I should like to ask you one more question. Why did you put some money into the little box at church? I had often seen it, but never thought of its use."

"That chest of oak is placed there, by wise authority, to receive the alms for the poor; a certain number of times in the year the collection is distributed to the destitute, and we are thus provided with a way of exercising Christian charity."

"Then you do not know what is done with your money; you cannot tell who has benefited by it?"

"If we were to look upon what we bestow on the poor as an offering to our Saviour, who has left them to try our faith, we should not consider what individual assistance we give. The holy apostles, and disciples of Christ, exhort us to abundant alms-giving. Those who so help the poor, receive and honour their Maker, who, as He was poor and needy himself whilst he lived here amongst us, at His departure promised to leave with us the poor, that, by having pity upon them, we might, as it were, lend unto Him."

Mary was for some time silent before she had courage to intrude her history of the cap; but a kind encouraging look from Ellen invited her to explain what she saw to be passing in her thoughts. When she had heard it, she assured her she need not feel uncomfortable about its being Bessie's property; that Mary might believe herself authorised in acting as she had done, if she made the offering in the desire to do what she felt was right, and not from the mere pleasure of seeing others enjoy comforts through her means.

"I had thought, Miss Ellen, that I would give the

money to some poor person; but I feel now that I had better avoid the temptation which I might have to feel proud when I was thanked. Will you put my few shillings into the box at the church for me?"

"No, Mary, you shall do it yourself; we are allowed such feelings of delight when we obey the Lord, that I am sure, if you make your offering with a prayer for a blessing on it, you will experience such feelings of bliss as you have never felt before, and such as I would not rob you of."

"Then I will do so next time I go to church. And now tell me, before I go to grandfather, who is looking for me, if you think Miss Francis is very angry?"

"I will not conceal from you that I think my cousin was a little vexed; but you must not allow this to alarm you; receive it as a blessing, for it is a further trial of the virtue you desire to learn, and you must meet it with gratitude."

"I think I shall be able to bear her questioning now, but you will help me?"

Ellen readily promised to do this. Smiling cheerfully at her dismay, she led her back to the rest of the party. They so soon dispersed to their respective homes, that there was no opportunity for Anna's referring to the subject. Mary felt quite relieved; and when she got home and put off the neat clothes of the baby, before she laid her in her cradle, she thought they looked much prettier in the drawer than they had in the morning, when she had been inclined to desire that the cap had been handsomer.

Biographical Sketches of Eminent Painters.

GAINSBOROUGH.

GAINSBOROUGH was a contemporary of Sir Joshua Reynolds, and was born in 1727, at Sudbury, in Suffolk. Nature was his teacher, and the woods of Suffolk his academy. There he would often pass whole mornings in solitude, sketching perhaps an ancient tree, a marshy brook, a few cattle, a shepherd and his flock, or any other picturesque objects which accident placed in his way. From delineation he proceeded to colouring, and during the tender age of from ten to twelve, he painted several landscapes.

There seems to be a blank in Gainsborough's history from that period; but it is certain that he repaired to London, and there employed himself in portrait-painting, in which branch of the art he was eminently successful.

His landscapes are universally admired for their faithful representation of nature. The brilliancy of Claude de la Lorraine, and the simplicity of Cuypers, a celebrated Dutch landscape-painter, appear to be combined in Gainsborough's rural scenery.

Sir Joshua Reynolds says, in one of his academic discourses, "If ever this nation should produce genius enough to acquire us the honourable distinction of an English school, the name of Gainsborough will be transmitted to posterity, in the history of the art, among the first of that rising name."

In another part of the same discourse, Sir Joshua expresses the delight he took in Gainsborough's works, and speaks with enthusiasm of the powerful impression of nature which that artist exhibited in his portraits and landscapes, and the interesting simplicity of his little beggar-children.

He then speaks of some of the customs and habits of Gainsborough. Among others, he says, "He had a habit of continually remarking to those who happened to be about him, whatever peculiarity of countenance, whatever accidental combination of figures, or happy

effects of light and shadow, occurred in prospects, in the sky, in walking in the streets, or in company. If in his walks he found a character that he liked, and whose attendance was to be obtained, he ordered him to his house; and from the fields he brought into his painting room stumps of trees, weeds, and animals of various kinds, and designed them, not from memory, but immediately from the objects. He even framed a kind of model of landscapes on his table, composed of broken stones, dried herbs, and pieces of looking-glass, which he magnified and improved into rocks, trees, and water. How far this latter practice may be useful in giving hints, the professors of landscape can best determine. I mention it only as it shows the solitude and extreme activity which he had about everything that related to his art."

Gainsborough painted much at night, and Sir Joshua remarks with reference to this circumstance, "I am indeed much inclined to believe that it is a practice very advantageous and improving to an artist; for by this means he will acquire a new, and a higher perception of what is great and beautiful in nature. By candlelight, not only objects appear more beautiful, but from their being in a greater breadth of light and shadow, as well as having a greater breadth and uniformity of colour, nature appears in a higher style; and even the flesh seems to take a higher and richer tone of colour."

"Another practice Gainsborough had, which is worth mentioning, as it is certainly worthy of imitation; I mean his manner of forming all the parts of his pictures together; the whole going on at the same time, in the same manner as nature creates her works. Though this method is not uncommon to those who have been regularly educated, yet probably it was suggested to him by his own natural sagacity. It is to the credit of his good sense and judgment that he never did attempt that style of historical painting for which his previous studies had made no preparation."

Gainsborough "was well aware that the language of the art,—the art of imitation, must be learnt somewhere, and as he knew that he could not learn it in an equal degree from his contemporaries, he very judiciously applied himself to the Flemish school, who are undoubtedly the greatest masters of one necessary branch of art, and he did not need to go out of his own country for examples of that school; from that he learnt the harmony of colouring, the management and disposition of light and shadow, and every means which the masters of it practised to ornament and give splendour to their works."

"He occasionally made copies from Rubens, Teniers, and Vandyck, which it would be no disgrace to the most accurate connoisseurs to mistake, at the first sight, for the works of those masters. What he thus learned, he applied to the originals of nature, which he saw with his own eyes, and imitated, not in the manner of those masters, but in his own."

In portraits, landscapes, and fancy-pictures, Gainsborough's talents were equally remarkable. "In his fancy-pictures,"—to use the words of his great contemporary, whom we have already quoted,—"when he had fixed on his object of imitation, whether it was the mean and vulgar form of a woodcutter, or a child of an interesting character, as he did not attempt to raise the one, so neither did he lose any of the natural grace and elegance of the other. This excellence was his own, the result of his particular observation and taste; for this he was certainly not indebted to the Flemish school, nor indeed to any school; for his grace was not academic, nor antique, but selected by himself from the great school of nature."

The peculiarity of Gainsborough's manner has been much criticised. On a close inspection of his pictures, odd scratches and marks are observable in them, which appear to be the effect of accident, or carelessness, but when viewed at a distance these strange lines seem all

to unite in their proper places, and to form a correct and striking picture. There is no doubt but that Gainsborough considered this peculiarity in his style as a beauty in his works, because it possesses the power of exciting surprise; for it is well known that he was always anxious that his pictures, at the exhibition, should be seen near, as well as at a distance.

We will now briefly speak of Gainsborough in his private relations of life. He possessed a generous heart, and was ever inclined to relieve the sufferings of poverty. When he visited a cottage for the purpose of exercising his pencil, the inhabitants of the rustic dwelling generally participated in the profits of his work. His liberality extended also to persons of a different class. He could not refuse his kindly aid to any one who needed assistance; and unfortunate friends, and poor relatives, infringed upon those resources which would have enabled him to have left his family in such a state of affluence after his death, as might have been expected, when we consider how much his works were esteemed.

A few days before his death, Gainsborough wrote to Sir Joshua Reynolds, expressing his acknowledgments for the good opinion Sir Joshua entertained of his abilities, and the manner in which, he had been informed, he had always spoken of him. He also expressed a great desire to see Sir Joshua once more before he died. This request was immediately acceded to by Reynolds, who says, that the impression this last interview left on his mind was, that Gainsborough regretted losing life principally on account of leaving his art, which he loved with so much enthusiasm. He died in 1788, at the age of sixty-one.

Poetry.

In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.

LINES

WRITTEN AT CHRISTMAS, 1846.

S. M.

"PEACE upon earth!"
Oh! Seraph-voices, sounding through the gloom,
While yet the wondrous Birth
Slept in the Morning's womb,—
Where is the promise of your strain?
God gave it—Man hath made it vain.
Where the Babe sleeps
On its hush'd Mother's heart?—Her loving gaze
In its sereneest deeps
Hath trouble; for her praise
Is not that she hath peace, but knows
How to be patient amid woes.
"Peace upon earth!"—
Where? In still shadows, among midnight hills,
Where the lone stream has birth
Or the slow raindrop fills
Hollows of twisted rocks that lie
Aloof from human foot or eye!
But not with Life,
Which is the Gate of Death, where hurrying throngs
Gather in powerless strife,
Casting their woes, their wrongs,
Like bubbles, on the vacant air,
Then passing—into Night! Not there!
Peace among Men?
Oh, mockery! While Love pants for Love in vain,
And Mirth is gaudiest when
"It shrouds a secret pain,
And the Soul battles with the Sense,
And tears are Joy's true eloquence!"

While Self alone
(Man's miserable god) is served and sought,
The shadow of whose throne
Dwarfs each up-towering thought—
While Earth's mean jealousies intrude
Even on the Altar's sanctitude.

While Sin and Fear,
With noise ignoble, mar the heavenly notes,
Till scarce for watchful ear
Their faintest echo floats—
Yet, harken! In that far, dim, sound
Life's din is, for a moment, drowned!

"Peace upon earth!"
Nay, rather, Peace below it! Oh, great Death!
Thou new and glorious Birth!
Thou true and living Breath!
Thou only on our hearts canst lay
The Peace which passeth not away!

How long, O Lord,
Ere Thou redeem Thy promise? Ere Thy Peace
Shall, as of old Thy Word,
Make earth's wild tumult cease,
And, underneath Thy brooding Dove
The waters shall give birth to Love?

Miscellaneous.

I HAVE always held that the life of man's mind, where man has a mind, (which is not always the case,) is a thing of fits and starts. I even doubt whether any one who will take the trouble to recollect, will not be able to lay his finger on the precise periods at which new views of everything suddenly opened before him, and he emerged at once, if not into new powers, at least into a new use of them. The frame may grow like a tree; the faculties may grow as imperceptibly as the frame; but the mind acquires that knowledge of life which forms it exercise, its use, and perhaps its essence, by bounds and flights.—*Marston.*

WHEN benefits are lost, the mind has time to recount their several worths; which, after a considerate search she finds to be many more than the unexamining possession told her of. . . . Blessings appear not till they be vanished.—*Feltham's Resolves.*

TRUE devotion consists in having our hearts always devoted to God, as the sole fountain of all happiness; and who is ready to hear and help his otherwise helpless, miserable creatures.—*Bp. Wilson.*

INGRATITUDE is the abridgement of all baseness, a fault never found unattended with other viciousness.—*Fuller.*

The Cottage Home.

THE COTTAGE HOME.¹

MINE be a cot beside a hill,
A bee-hive's hum shall soothe mine ear;
A willow brook that turns a mill,
With many a fall, shall linger near.

The swallow oft, beneath my thatch,
Shall twitter from the clay-built nest;
Oft shall the pilgrim lift the latch,
And share my meal—a welcome guest.

Around my ivied porch shall spring
Each fragrant flower that drinks the dew;
And Lucy, at her wheel, shall sing,
In russet gown and apron blue. — *Rogers.*

THE SOCIETY OF ARTS.

EXHIBITION OF BRITISH MANUFACTURES.

A VERY important move has just been made by the Society of Arts, in furtherance of the objects for which this Institution was originally formed: namely, the Encouragement of Works and Inventions in Fine Arts, Mechanics, and Manufactures. Hitherto, the Society have offered, annually, premiums to stimulate the progress of invention and design; in addition, they now propose a series of annual exhibitions of select specimens of British Manufactures and Decorative Art, to show what has already been done, and to mark the precise point from which the competitors for the annual premiums may advantageously start. The first of these exhibitions has recently been opened at the Society's house, in the Adelphi; and, thus far, the design has proved successful. Before, however, we describe its most attractive features, let us glance at the origin, objects, and present prospects of the Institution itself.

Every one at all acquainted with the history of invention, must know how numerous are the struggles of genius in seeking to make known its creations; the inventor may toil, and toil again, in his workshop ere his results be fully developed; and, even when this is accomplished, who is to introduce his inventions to the great world, by whom genius is to be requited, and industry crowned with its own reward? This is the hill of difficulty which poets and artists have shown us it is hard, indeed, to climb; and to smoothe the road, and proffer such introduction, was the first object of the Society of Arts. "To this Society," says a well-informed contemporary, "some of our best artists have owed the most priceless of all services that can be rendered to men of genius at the outset of their career—appreciation on the part of an enlightened few—introduction under favourable circumstances to the many." It was established in 1754, chiefly by Mr. William Shipley, a drawing-master; it had many difficulties to contend with, such as alike beset the infancy of individuals and institutions; and it was not until 1774 that the Society was fairly located in its own premises, built for them, in handsome style, by the Adams, in John-street, Adelphi; the object being denoted by the inscription upon the entablature of the pediment in the front of the mansion, in these words: "ARTS AND COMMERCE PROMOTED."

There are many interesting anecdotes of the early awards of the Society. Thus, in 1758, Bacon, the sculptor, received for a small figure of Peace a reward of ten guineas; and the same artist gained the highest premium upon nine different occasions. In 1761,

Nollekens received ten guineas for the alto-relievo of Jephthah's Vow; and, two years later, fifty guineas for a more important piece of sculpture. Flaxman, in 1768, received for one of his earliest attempts a grant of ten guineas; for another work, in 1771, he obtained the Society's gold medal. Lawrence, at the early age of thirteen, received the reward of a silver palette, gilt, with five guineas in money, for his drawing in crayons of the Transfiguration; and the painter, in the height of his subsequent prosperity, was accustomed to speak of the impulse thus given to his love of art. Sir William Ross received the Society's silver palette in 1807, at the age of twelve, for a drawing of the death of Wat Tyler; Mr. Edwin Landseer received a similar mark of approbation in 1810, for an etching; and to Mr. Wyon was adjudged the gold medal, in 1818, for a medal die. But to artists there is a feature of still greater interest in the Society's history: it was in its rooms that the first public exhibition of paintings in England took place in 1760, which was continued with great success for some years. We must, however, be brief in our recapitulations, and add that, within about ninety years, the Society have distributed more than 100,000*l.* in premiums. The growth of forest trees was one of its early objects of encouragement; and we find among the recipients of its gold medals, the Dukes of Bedford and Beaufort, the Earls of Winterton, Upper Ossory, and Mansfield, and a Bishop of Llandaff. Then came agriculture, chemistry, manufactures and mechanics. "In the latter, the Society taught us, or at least aided those who did so, the manufacture of Turkey carpet, tapestry weaving, weaving to imitate the Marseilles and India quilting; also, how to improve our spinning and lace making, our paper, and our catgut for musical instruments, our straw bonnets and artificial flowers. The Colonies shared in its extensive beneficence: potash and pearlsh were produced by the Society's agency in North America; and, just before the war of independence, which separated the States from England, broke out, it was busily engaged in introducing the culture of the vine, the growth of silkworms, and the manufacture of indigo and vegetable oils. But the rewards, some twenty in number, given within the last half century to poor Bethnal-green and Spitalfields weavers, for useful inventions in their calling, illustrate perhaps even better than any of the foregoing notices, that feature of the Society which so honourably distinguishes it from all others in the present day—its readiness to receive, examine, and reward every kind of useful invention that may be brought forward by those who have neither friends nor money to aid them in making their inventions known."

Thus far the excellent object of the Society,—to produce each year new achievements which shall mark new steps towards the perfection of British Art. It is, however, very important to know what has already been done in the Arts, so as to mark the point of perfection from whence the competitors should start; and, for this purpose, the Society of Arts have just commenced a series of exhibitions, to show each year, in some departments of arts and manufactures, the degree of perfection already attained. As the articles have been selected with great judgment, the result of their exhibition will, unquestionably, be the improvement of the taste of our artists, manufacturers, and the public. Accustom them to good art, and they will soon cease to prefer the vulgar and the gaudy to the beautiful and perfect. The peculiarity of our manufacturers is their wonderful power of multiplying; therefore improvement of materials, and increase of forms of artistic usefulness, should be the main points. Unlike foreigners, English manufacturers produce a thousand from one. "What a consummate artist has designed, they can multiply by the thousand. It is only, therefore, by the appreciation of the thousands and the millions, that taste, design, and high art, applied to our manufactures, can

(1) See Illustration in preceding page.

be supported." We are persuaded that if artistic manufactures be not appreciated, it is because they are not widely enough known; and the purpose of this exhibition is to place before the public a few selected specimens in some of the decorative arts, of what our artists, manufacturers, and machinery, have done or are doing for the advancement of their various arts to perfection.

The exhibition has been opened to the members of the Society and their visitors at two *soirées*, which were very numerous attended. The several articles were arranged with great taste in the Society's large room, which was brilliantly illuminated for the occasion; when, we assure the reader, the decorative character of the specimens, and the company, in full evening dress, combined to produce a very imposing *coup d'œil*. The saloon is one of the finest halls in the metropolis: its lofty walls bear the grand series of paintings by Barry, extending 114 feet by 11 feet 10 inches in height; these have lately been cleansed of dust and dirt, and the coved ceiling has been superbly decorated by Mr. Hay, of Edinburgh, in what may be termed a style of mathematical splendour. There are likewise upon the walls portraits of the early presidents of the Society, painted by Reynolds; and they seemed in their artistic felicity to look approvingly upon the meeting. The scene presented a sort of realization of Barry's noble pictorial axiom, and in effect reminded us of Johnson's weighty words; "there is a grasp of mind there which you will find nowhere else."

As the specimens are some two hundred in number, we shall merely be enabled to remark generally on the particular classes of objects exhibited, which are discriminative and instructive rather than striking. They are mostly of the domestic class; that is, adapted for house decoration or usefulness; and, in their elegant ingenuity recalling to our minds the sarcastic compliment of the *Edinburgh Review* to the genius of one of the Society's vice-presidents, who "meditated muffineers, and planned pokers."

The branches of pottery and porcelain have an historical interest, by enabling us to compare the specimens before Wedgwood's time with present productions; in which we cannot fail to remark the great advance made during the last half century, until we have arrived at an execution which fairly rivals the productions of Sevres and Dresden: a China flower-pot, two plates, and a breakfast cup, and card dish; two figures with baskets for flowers, and a vase, are the especial evidences of this approach to Continental excellence. We should recollect, by the way, that the Sevres and Dresden manufactures have been reared by royal support or by the governments of their countries, whereas the British success is as usual the result of individual enterprise. In China-printing and painting, the evidence, too, is very satisfactory. Among the specimens are a coffee-cup and saucer, in which the festoons are printed, and the roses painted, by hand; they are manufactured by Minton and Co, for the French markets, and are constantly re-imported as exemplifying the superiority of the French China over the English. We were also much gratified with another specimen bearing impressions from Everdengen's etchings of Reynard the Fox, coloured after Mr. J. Linnell; this being an approach to high art, at the suggestion of Felix Summerly, who has done so much towards the improved illustration of books for children.

The statuettes of Messrs. Copeland and Garrett, and Minton, in respect of material, or body, are particularly

excellent: thus, the Apollo is in statuary porcelain, a beautiful material, more durable than marble, and not liable to stain; of the same is Narcissus, after the original by Gibson: Danecker's Ariadne is in another new material, named Parian; and there are also two exquisite vases, modelled from Italian Swiss originals, at the instance of the Duke and Duchess of Sutherland. We agree with the "introductory remark" read to the meeting, that "by means of this material, it is clear that our sculptors have an opportunity for distributing works of the highest art among an unlimited number."

We must, however, notice a few of the Staffordshire-ware curiosities. One of these is a specimen manufactured before the time of Queen Elizabeth: the body is of native brick-earth, and the outer glaze of pulverized lead ore, dusted on the ware as it is taken from the thrower's wheel. Another is a butter-pot, as mentioned by Dr. Plot, in his "History of Staffordshire;" hence, the butter from Ireland or Wales sold in casks is called in the Potteries "pot butter." Next is a "tyg," or drinking cup, with many handles, intended for the use of several persons, that each might sip from a part which had not touched the lips of his companions; this "tyg" is an evidence of the rarity of earthenware, for, at the present time, almost every child has its own mug or cup. An old trencher, made at Delft, in Holland, attracted our notice; the trencher, by the way, gave rise to the term generally applied in Ireland to English earthenware.

Among the novelties is a large bread plate, (white, with broad gold edge,) in the form of a shell, manufactured by Minton and Co. for the Duchess of Sutherland, and at her Grace's suggestion. The China specimens are very beautiful; but we can only mention a coffee-cup and saucer, green ground, richly gilt, made by order of the Duchess of Kent as a present to the Queen on Her Majesty's birthday, and in every way worthy of the occasion.

There are some interesting specimens of Wedgewood-ware, manufactured at Etruria, near Burslem; including an Etruscan vase, a copy of the Portland vase; and a Dolphin, as a candlestick, designed by Flaxman.

In parting with the earthenware collection, we felt the justice of a shrewd remark made some years since in the *Edinburgh Review*. "Let any one recollect the ugly forms of our ordinary crockery and potters' ware forty or fifty years since, when the shapes were as deformed as that of the pipkin which cost Robinson Crusoe so much trouble, and observe the difference since the classical outlines of the Etruscan vases have been adopted as models for our Staffordshire ware." To the curious in such matters it may be interesting to mention, that a very fine collection of old Staffordshire specimens has been lately purchased for the Museum of Economic Geology, Craig's-court, Charing Cross, where they may be seen on application to Sir Henry Delabèche.

Next in the exhibition are some specimens of carving in wood and marble by machinery: all the work so executed leaves the machine in the rough, and is finished by hand, and the saving of time and expense is thus very considerable; there are specimens in the respective stages, and among them, a bunch of hops, which shows the applicability of the machine for the deepest undercutting; this is very successful, as are the examples generally; a large sideboard, of magnificent design, too, is almost worthy of the old carvers. The principle of the machinery is an arrangement of chisels, or cutting blades, worked vertically by steam power. Much of the carving in the new House of Lords has been executed by this system; and nothing but such aid could have enabled Mr. Barry to complete the elaborate woodwork interior in time for some of the impatient peers: our old sculptors in wood passed years in executing what may now be effected in as many months.

We have, however, omitted to notice among the

(1) The late Mr. Thomas Hope, who for some time was one of the Vice-Presidents of the Society of Arts. Mr. Hope, it will be recollected, has applied the fine arts with judgment to the internal decoration of houses, and has written and published a valuable work upon the subject. His town mansion, in Duchess-street, is a superb memorial of his classic taste in decorative art; the furniture being chiefly from his own designs and adaptations. The whole is liberally placed at the inspection of the public by tickets, during the London season.

earthenware, the collection of Mosaics, Encaustic and other tiles, severally calculated to revive and extend a mode of decoration which all ages and countries have employed, and which has only fallen into neglect within the last two centuries. The facility, precision, and cheapness of this English manufacture of tesserae promise higher perfection in this mode of decoration than has ever yet been attained. We admire such works as relics of the Roman civilisation of Britain; but it is equalled by the pavements in the Society's Hall, in the Conservative and Reform Club-Houses; and the public will soon have the opportunity of seeing Mr. Barry's employment of the Encaustic tiles as a pavement in the hall of the New House of Lords; certainly the finest specimen in this country, and probably, in the world. In all places where pavements are used, these beautiful Mosaics and Encaustic tiles will supersede floor-cloth and naked flag stones. They have already suggested better patterns for floor-cloth; so that the absurdity of walking over mullions and tracery, as in some ridiculous patterns, will no longer be countenanced.

In *Papier Mâché*, from Birmingham, there are some elegant specimens. The manufacturing process consists of pasting by the hand numerous layers of sheets of paper together, which are formed on moulds, baked, and varnished. This, however, differs from the French process; for in the streets of Paris, not many years since, persons used to scrape the walls of old posting-bills, which they made into paste, and *papier-mâché*. Some of the Society's specimens are inlaid with mother-of-pearl by a patent process, and others are artistically painted, and superbly enamelled and illuminated. Still, to our thinking, the great merit of *papier mâché* is its noiseless quality; enabling you to place articles upon it without disturbing the most nervous ear, as is done by metallic sounds.

The *Metal Cases* are excellent as English manufactures, but they are a long way behind the Continental work of this class. A bronze from the Coalbrookdale Iron Works is the nearest approach to the Berlin work. An ornamental iron clock-case is, also, an economical novelty.

The *Glass* is highly promising, though it only betokens what British manufacture in glass may accomplish, now that it is released from Excise restrictions. Some of the engraved glass is very cleverly executed; the Bohemian is approximated; and the vitrified colours, gilding, and enamelling, are alike successful. Of quarry glass there are some good examples, in imitation of the ancient stained glass windows; and they are nearly as cheap as plain white glass. The artificial flowers in some of the vases are of English manufacture, and equal those made in France.

The *British Marbles*, engraved and inlaid, and carved by machinery, and some articles in slate, show that we have beautiful native materials for the best antique forms. The carving marble by machinery is a great feat of mechanical skill.

In *Colour-Printing*, a very complex branch of art, there are some promising specimens. There is an admirable example of block-printing in Murillo's "Beggar Boys," of large size, printed in five blocks, yet so cleverly as to present an entire whole. Of bookbinding, in *relievo* leather, there are some costly specimens, from very characteristic designs.

There are some finely cast and chased *Lamps and Candelabra*, of brass; they are "dipped," and burnished to preserve their colour; the metal is then made hot, and a coating of lacquer is laid on, to prevent the atmosphere from acting upon the surface. An efficient substitute for costly gilding is very desirable; and this is an approximation.

We have omitted a work in metal, which is worthy of notice, as much on account of the beauty of its design, as the novelty of its manufacture. This is a large table ornament, in frosted silver; the subject, an

oriental group. It is of sheet silver, instead of being cast, as is usually the case. The vase was originally a flat piece of metal, and has been worked by degrees into its present form; by which method there is a saving of about two-thirds of the weight of metal which would be required if it were cast. This work is from the manufactory of Mr. B. Smith, of Duke-street, Lincoln's-inn Fields.

It will be seen by this rapid glance at the classes of specimens exhibited by the Society of Arts, that they entirely fall within the scope and objects of the institution. The several articles are more or less important to the comfort, elegance, and luxurious embellishment of an English home; proper aims for high civilisation, and the right direction of genius and industrial art. Still, the display is but a beginning, and better will indubitably follow.

The *soirées* were brilliantly attended; and the exhibition has since been visited by hundreds of persons, free of charge; at Easter, it proved very attractive.

His Royal Highness Prince Albert, who is the President of the Society of Arts, has visited the exhibition, and, after an hour's inspection, expressed himself highly gratified with the display. The Prince, we have reason to know, takes especial interest in our artistical manufactures; his inquiries are not those of mere curiosity, but evince his acquaintance with processes, and practical working of branches of manufacture. The inventor of a patented improvement, who recently submitted his productions to the Prince, at Buckingham Palace, found His Royal Highness fully conversant with the various stages of the manufacture of the article exhibited, which was *papier mâché*.

Amongst the distinguished aid afforded to the Society of Arts, we should mention that of the Duke and Duchess of Sutherland; their Graces having at considerable personal anxiety, caused models of rare works in foreign museums to be expressly taken for the Society, whom they have likewise aided by the loan of bronzes, and other costly works of art.

Under these high auspices, we trust to see the Society of Arts attain rank among our national Associations, even beyond that in the brightest years of its foundation. Several artists of celebrity, and men of taste and opulence, have lately joined the Institution; and their transactions are assuming an importance befitting the noble object of the Institution,—to exalt Great Britain amidst the industrial nations of Europe.

SOME PASSAGES FROM THE JOURNAL OF A WILTSHIRE CURATE.¹

January 13th.—My journey to Trowbridge has been successful, beyond my most sanguine expectations. I reached that ancient town late in the evening, wearied with my long walk, and was so overcome with fatigue, that I did not rise till late the next morning. After making a very careful toilette, (indeed I do not think I have been so well dressed since my wedding-day, for my good and attentive Jane had provided everything her father could want,) I went to pay my visit to Mr. Withell, who resides in a large handsome house. He received me rather coldly at first; when, however, I mentioned my name, he conducted me into a small private room. I then thanked him for the forbearance he had already shown me in not pressing for payment; explained to him how I came to put my name to the bond, which a series of misfortunes had rendered me incapable of paying; and ended by tendering my twelve pounds as a first payment towards the liquidation of the debt. He took my hand, and shook it warmly, whilst he gazed in my face with a strong expression of approbation. At last he said, "Excellent man! I know you

(1) Concluded from page 59.

well. I know your situation, and how admirable all your conduct has been. Take back your money; it is impossible for me to deprive you of it in your present circumstances. I would rather, if you will permit me, add something to it, which may for ever preserve me in your recollection." So saying, he rose and left the room, but speedily returned with an open paper in his hand. "You know this bond," said he, "and your own signature? I present it to your children and yourself;" and tearing it in two, he placed the paper in my hands. I could find no words to thank him, so great was my agitation. My eyes filled with tears. He saw well enough that I would fain have spoken, but could not command my voice. He said, "Not one word, I entreat you; that is the only proof of gratitude which I require from you. I would willingly have relinquished my claim upon the unfortunate Col. Brooke, had he but confided his embarrassments to me." This generous man made many inquiries respecting the state of my affairs, and listened with interest to the whole history of my life. He then presented me to his wife and son, and insisted on my remaining a couple of days with him. I was quite astonished at the splendour of his house and furniture, so much so, that I was almost afraid to touch anything. He sent me home in his own handsome carriage, and it was with an agitated heart that I took leave of my noble benefactor. My children wept for joy when I showed them the torn paper, saying, "See, this little paper was the heaviest burthen of my existence; a generous hand has delivered me from it. Pray for the blessing of God upon our preserver."

January 16th.—Yesterday was the most remarkable day of my life! As we were sitting quietly together, I, with little Alfred upon my knees, Polly reading aloud, and Jenny sitting at the window with her knitting in her hand, she started suddenly from her seat, and fell back again, as pale as death. Much alarmed, I asked her what could be the matter, when she endeavoured to force a smile, and exclaimed, "He is coming!" At the same moment the door opened, and Fleetman entered the room. He was extremely well dressed, and looked very handsome. We all greeted him with the utmost delight, and congratulated him upon being apparently in much better circumstances than on his first visit. He shook me warmly by the hand, kissed Polly, and bowed most courteously and respectfully to Jane, who could not recover from her surprise. He observed how pale she looked, and inquired with the tenderest interest after her health. Polly explained it all to him, on which he kissed Jane's hand, as if anxious to obtain her pardon for the alarm he had given her. There was no necessity for saying much, for the poor girl's colour soon returned, and then she blushed as red as an opening rose bud. I desired Polly to bring in cake and wine, in order to receive our guest better than the first time; but he declined, saying that he could not remain long with us, as he had friends waiting for him at the inn: however, at Jenny's request he sat down, and consented to partake of some slight refreshment. As he mentioned that he was travelling with some friends, I imagined that he was probably with a company of actors, and asked him if they were thinking of giving a representation in such a poor place as Cricklade. He laughed outright, and said, "True, we are playing a comedy, but it is gratis." Polly, who longed to see a play, was out of her wits with joy at these words, and repeated them to Jane, who just then entered the room with cake and wine. Polly inquired of Fleetman whether there were many performers besides himself, to which he answered, "One gentleman and one lady, but they are capital actors." Jane appeared unusually serious. She fixed her eyes on Fleetman with a grave and impressive look, and said; "And you too!—will you also appear on the stage?" These words were uttered in a deep and penetrating tone of voice, which I had seldom heard from her but in the most critical and agitating moments—moments on which depend the

welfare of a whole existence. Poor Fleetman started as if he had heard the voice of the destroying angel; he raised his eyes to hers, with a singular expression of countenance, and seemed struggling with himself how to reply,—at last, advancing two or three steps towards her, he said, "That, I solemnly declare, depends upon yourself alone!" She fixed her eyes upon the ground: he continued speaking in a low voice, she occasionally answering him. I could not conceive what they were about. As they continued talking, Polly and I listened with the utmost attention, but we understood not a word they were saying; that is to say, we heard words without the slightest meaning; and yet Fleetman and Jenny appeared not only to understand one another, but, what seemed to me more extraordinary, Fleetman was deeply agitated by Jane's words; though, in fact, there was nothing so remarkable in them. At last, Fleetman folded his hands solemnly together, and raising his eyes to heaven, exclaimed with the vehemence of despair, "Then I am indeed the most miserable of men!"

Polly could bear it no longer: she glanced rapidly from one to the other, with the most comical expression of embarrassment, and at last exclaimed, "Well, I really think that you two have already begun to perform the comedy."

"Would to Heaven it were nothing more!" said he.

I put an end to this absurd scene, by offering them cake and wine, and we all drank to the health and happiness of our benefactor. Fleetman turned to Jane, as she raised her glass, "In truth, do you wish me happiness?"

She placed her hand upon her heart, looked down, and drank the wine. This simple action produced a wonderful effect upon Fleetman: he crossed the room gaily, and approached Alfred's cradle. Whilst Polly and I were proceeding to relate to him under what extraordinary circumstances the child had made its appearance in my house, he interrupted us by saying, laughingly, to Polly, "Well, you have never thanked me for the New Year's gift I sent you!"

We all exclaimed, with the most uncontrollable astonishment, "You! You sent him?"

He then commenced the following recital, to which we listened in breathless amazement.

"My real name is not Fleetman. I am Sir Cecil Fairford. An only sister and myself were left orphans at a very early age, and long deprived of our rightful inheritance, by a claim brought against us by my father's brother, founded on some ambiguous expressions in an old will. My mother's fortune was expended in our education. My sister suffered most from the unkindness of her uncle, who was also her guardian. It was his wish to bring about a marriage between her and the son of one of his own friends, but she had already formed an attachment to the young Lord Sandon, whose father strongly opposed their engagement. Their only resource was a clandestine marriage, which took place without the knowledge of any of their relations. These are the parents of your foster-child. Some time ago, under the pretext that her health required sea-bathing, my sister obtained the permission of my uncle to accompany me in a journey to the coast. But the great difficulty was, after the birth of the child, how to provide for its being carefully nursed and tended, until its parents should be enabled to declare their marriage. I accidentally heard a most touching account of the poverty and benevolence of the curate of Cricklade, and came in person to ascertain the truth. You received me in a manner which decided me at once. I forgot to say that my sister was not under the necessity of returning to my uncle's house. A few weeks ago, I won my lawsuit, and entered into immediate possession of the house and property of my ancestors, of which I had been so long unjustly deprived. A new suit was immediately instituted against me for the guardianship of my sister's person, who is still under age, when the sudden death of the old Lord, who was struck with apoplexy a few

days ago, put an end to the suit by enabling my brother-in-law to declare his marriage and acknowledge his child. The happy parents have accompanied me to claim the little Alfred from your hospitable hands, and to add their entreaties to mine, that you and your daughters will not refuse to accompany us, and will consent to the proposition which I am going to make you. Whilst the law-suit was pending, a small living in the gift of my family became vacant. It is endowed with about 200*l.* a year, besides the tithes and a house. You, Sir, are now without preferment: I cannot express the happiness it will give me, if you will accept this living, and reside in my vicinity."

God alone knows what I felt at these words; tears of joy dimmed my eyes; I seized the hands of him who appeared to me as a messenger from Heaven, and pressed them to my heart. Polly threw herself into his arms, and Jane, blushing and confused, kissed his hand. He, however, appeared overcome with agitation, and rushed out of the room.

My dear children had scarcely recovered from their astonishment, and amid exclamations of delight and thankfulness were still covering my face and hands with their kisses, when Sir Cecil Fairford returned, accompanied by his brother-in-law, Lord Sandon, and his wife. The latter, a lovely young creature, without stopping to speak to us, rushed to the cradle, threw herself on her knees beside the child, kissed his cheeks, his hands, his feet, and shed torrents of tears of mingled grief and joy. Her husband raised her from the ground, but had much difficulty in calming her. When she had recovered herself a little, she turned to me, and Polly, with a thousand excuses, and the most touching expressions of gratitude and delight. Polly, pointing to her sister, who was half hidden by the window curtain, said, "It is my sister who has replaced his mother." Lady Sandon went up to Jenny, and, examining her for an instant with the deepest attention, turned to her brother with a smile of intelligence and approval, and then caught Jenny in her arms, and tenderly embraced her. Overcome with confusion, Jane scarcely dared to raise her eyes. "I owe you a debt," said her ladyship, "which it will be utterly impossible for the heart of a mother ever to repay. But sisters, dearest Jane, have no accounts together, and it is only when I see you the wife of my brother, that I can feel absolved from my debt of gratitude." The young man had by this time approached them. "Here is my poor brother," continued she; "may he not venture to hope? dare he not hope to make you one day my sister?"

Jane, deeply blushing, could only articulate, "He is my father's benefactor."

"And will you not in return become his benefactress? Oh! smile upon him, dearest Jane. If you could but know how he loves you!"

Sir Cecil Fairford then took Jane's hand, and, kissing it, notwithstanding her efforts to withdraw it, said, "Surely, you would not make me miserable for ever? And if you refuse me this hand, nothing can prevent my being so." Much agitated, she no longer sought to remove it. He then led my daughter up to me, and entreated me to give them both my blessing, and solemnly accept him as my son.

I felt as if in a dream. "My beloved child," said I, "do you, can you love him? You alone must decide."

She looked at Sir Cecil, who stood beside her in a state of the utmost agitation, with an expression of unspeakable tenderness, and, taking his hand between both of hers, and pressing it to her heart, she raised her eyes to Heaven, and said, "God himself has decided." I blessed my sweet and dutiful daughter, and the husband of her choice, and placed her in his arms. There was a solemn silence, only interrupted by sobs and tears.

Suddenly Polly jumped up, and, smiling through floods of tears, threw her arms round my neck. "That's it," she cried. "That was the New Year's gift! this is the meaning of the Bishop's Mitre!"

Just then, little Alfred awoke———. But it is in vain; no words can describe the mingled emotions of this day; my happy heart is too full, and must relieve itself in thanksgiving to the Great Author of all this happiness.

THE IRON MANUFACTURE.¹

WHEN the importance of such materials as boiler plates is remembered, it is obvious that no slight care is required in those who conduct the numerous processes of such a manufacture. The most disastrous accidents may result from the imperfections of a boiler plate, or the weakness of a steam engine wheel, and these can only be effectually prevented by the due performance of the works on which the strength of the iron chiefly depends. When a defective piece of iron metal has been allowed to find its way into the market, it may be used by some engineer in a work involving the lives of hundreds. Thus the passengers on board a steam boat, or in a railway train, may feel that their safety depends on the care exercised by some smelter, puddler, refiner, or roller, whose name they have never heard.

The probabilities of defect existing in iron, after so many processes, may be deemed small by those unacquainted with the troublesome faults often belonging to some particular kinds of ore. The pig-iron from some ironstones shrinks so irregularly in cooling, that part becomes unsound when cast in moulds, often producing the most serious faults. Suppose a number of cannon are made from such iron, they must inevitably fail to abide the test of the prover, or destroy many in the hour of action by bursting.

Bar-iron is also characterized by peculiar faults; some being too brittle when cold, though working easily enough at a welding heat; this is called "cold short iron," because it breaks short off when struck by a hammer, instead of bending. An opposite defect, called "red short," is the cracking during the welding at a certain heat, which renders the working exceedingly troublesome to the smith, though such iron is often serviceable when cold, being both hard and tough. The best iron, therefore, should be neither *red short* nor *cold short*, but capable of being easily worked, and possessing, when cold, great toughness of fibre. This last word is not improperly applied to iron which is really *fibrous*, having been brought to such a state by the rolling of many bars into one. A piece of superior bar-iron, when bent by a strong force, will not snap, but rather tear, just like a piece of green wood, which will not part from the tree until after much tearing and twisting of the fibres.

As iron is exposed to such serious defects, the necessity for subjecting it to some test before employing it in works requiring great strength, is evidently imperative. Iron which will be required to bear a great strain, such as that for chain-cables, is subjected to a powerful strain till it breaks, when the degree of force at which the metal gave way is noted, and thus a table of such figures enables the operative to calculate the probable strength of any piece of iron. A bar of iron having a diameter of one inch is expected to bear a weight of seventeen tons, and one of $1\frac{1}{4}$ inch diameter should support a strain of thirty-nine tons. Such a test is produced by a powerful machine, which extends a short bar of iron to more than one-fifth of its original length. Thus a bar having a diameter of one inch, and being $2\frac{1}{2}$ feet in length, will stretch five or six inches before it breaks. As some iron is required to be exceedingly strong, so peculiar processes are employed to secure the requisite strength. Some bars are passed twice through the heating furnaces, to secure additional toughness and fibre; others are refined in charcoal furnaces, and thus acquire the tenacity essential in the

(1) Concluded from page 37.

iron used for the making of such articles as tin plates, (which are iron sheets tinned over,) or the rods from which horse-shoe nails are made. Some iron, the surface of which is required to possess great resistance to friction, is *case-hardened*. By this process the outside of a piece of iron is made to possess a greater degree of hardness than the interior parts, a property necessary for the rollers, through which so many heated bars are passed. This result is produced by casting the rollers in *iron* moulds, instead of running them into sand; for the cold iron of the moulds coming suddenly into contact with the boiling metal chills the surface in an instant, and produces the peculiar external property termed *case-hardening*.

We have now briefly surveyed the steps by which the most useful of metals is drawn from its ore and placed at the disposal of man, who is thus furnished with a powerful instrument for gaining higher advances in civilisation. Every stage of the manufacture suggests matter for ample reflection on the numerous agencies by which our race is aided in its progress from rudeness to refinement. That the advances of the human intellect in arts and science materially depends on the use and wise management of a species of clay, is a fact admitted by all, but too imperfectly appreciated by most. How strongly does it illustrate the close connexion of the human mind with the physical forms of nature, that some of the greatest civilizing, and, therefore, moralizing influences, of later ages, arise from the control which man has acquired over a bit of ore!

The numerous forms in which iron everywhere presents itself, and the extensive uses to which it is applied, may suggest some notion of the obstacles to human improvement which the non-existence of the metal must have occasioned, or perpetuated. Probably none can so far transport themselves out of the social system in which they have always lived, as to have a perfect conception of the condition of England at this hour *without iron*.

What elements of power, of wisdom, of science, at once disappear! steam-engines cease in an instant; the railroad becomes a nullity; the thousand nice operations, requiring the most delicate steel, are no more; and the very constitution of our bodies undergoes a change, the effects of which the most learned chemist may in vain attempt to scrutinize. Thus, on the great boon of iron depends a long series of effects, the range of which comprehends some of the most important matters in the history of man. A piece of iron may therefore suggest to a thoughtful mind considerations of the very loftiest character. Such reflections may be stimulated whilst contemplating the ceaseless fires of the smelting and refining furnaces, or when listening to the din of engines with powerful rolls and gigantic hammers; but they need not depend on such striking operations for their existence;—the sight of a knife, a lady's needle, the wheel of an engine, or the piston of a boiler, is enough to call up a crowd of similar meditations.

The immense quantity of matter requisite for producing even a small weight of iron, surprises those who have failed to notice the consumption of ore and coal required to make one ton of finished iron: before this amount of metal is brought into the market, no less than fourteen tons of material have been used in its manufacture. Thus, to produce a ton of iron, in its *first* form of the "pig," the workman must get from the earth three tons of ore, to smelt which he requires nearly four tons of coal, reduced to coke; in addition to which another ton is necessary for sundry operations, whilst a ton of limestone is used as a *flux* to detach the metal from its clay casing. Nine tons of raw material are therefore essential for the production of one ton of the rudest pig-iron. And this must pass through several additional processes, in each of which it loses weight, and requires the consumption of a large store of fuel, so that, before the one ton of finished iron is ready

for the smith's use, about fourteen tons of matter have been absorbed.

The bulk of material expended to form the iron for all the railways made during the last twenty years, would thus form a huge mountain of ore. When this is borne in mind, and the numerous labours requisite for each stage of the manufacture are remembered, and also the cost of the powerful machinery employed in the rolling and cutting operations, we might expect that iron would be an exceedingly expensive production. But what metal is so abundant in our towns, or more used in the thousand offices of life? Such a victory has human skill obtained over rude material substances, that this highly elaborated metal has become cheaper than wood for the construction of houses, the building of ships, and the adornment of our cities. Notwithstanding the immense consumption of material, and the labours required in the manufacture, a ton of finished bar-iron can sometimes be bought for sums varying from 6*l.* to 7*l.*; but even the highest prices ever obtained seem low, when the numerous processes through which the metal passes are considered.

A reader may here ask what becomes of all the *waste matter*; for, as only one ton of iron comes from fourteen tons of other substances, thirteen tons must be dispersed somewhere in the making of every 20 cwt. of finished iron.

The atmosphere receives a large portion of this exhausted matter,—all indeed which partakes of the gaseous nature; and vast volumes of carbonic, oxygenic, and sulphureous vapours, are hourly poured into the air of an iron-district. But the solid refuse of all kinds is allowed to accumulate near the works, forming immense heaps, of which a large smelting furnace produces between twenty and thirty tons daily. Such collections give, in the course of years, a volcanic aspect to the region, by no means pleasing to the lover of the picturesque forms of nature, who gazes with disgust on the dreary lava-like heaps, termed by the workmen *cinder tips*. These hills of scoria have, however, recently engaged the anxious attention of the iron masters, and the scrutiny of chemists; for the immense heaps contain great quantities of iron, more than one-half of their bulk being metal; and to separate this from the valueless matter with which it is united, is one of the great problems proposed for solution to the modern chemist.

It does seem tantalizing, that the manufacturer must witness daily the dispersion of such stores of wealth linked in obstinate combination with masses of useless ashes. To feel that one of these hills of cinder is formed of half its bulk of valuable metal, which must be rejected, because the method of extracting the iron remains hidden amongst the discoveries of future years, must be sufficient to stimulate the experiments of the iron manufacturer and of the scientific chemist.

Patents have actually been taken out by some parties for the extraction of the metal, by which it was proposed to use these cinders, instead of the raw ore in the furnaces. But the iron produced was of too inferior a quality for marketable purposes, and hitherto the attempt has exceeded the skill of the manufacturer. This result must be regretted, as this scoria is really much richer in iron than the original ore itself; so that when used in the experiments above mentioned, it was mixed with clay, to make the scoria *leaner*, and therefore more like the natural ore. The prospect of extracting iron from these heaps, incited numbers to continue the attempt; but, notwithstanding the skill and care employed, the metal produced was so inferior in quality, that most gave up the effort to work the cinder, which had been so long accumulating, and in which some sanguine men had expected to find mines of latent wealth. This failure proves the imperfection of our knowledge in the chemistry of metallurgy. Human skill can bring the metal from its native ore, and draw it by various devices from its hiding-place in the earth,

to the homes of men; but a large and valuable portion of the iron escapes in the passage, like prisoners from the keeping of an escort, and baffles all our efforts to recover the fugitive. The cinder tips laugh at science, and look with an air of quiet challenge towards our schools of chemistry, as if deriding the skill of a Faraday, or the treasured knowledge left by a Davy. The hour will perhaps arrive, when some discovery will supply us with the key for unlocking the whole of the mineral treasures now hidden beneath masses of scoria. The cinders are not, however, quite neglected now, it having been ascertained that *some* can be safely employed, provided great care be used. But this can only be done when the best iron is not required; for the pigs produced from the fusion of the scoria are often dull, rough, and porous in their texture. All, therefore, that can at present be done, is to use the cinder now produced at the furnaces; thus preventing future accumulations, but leaving the old heaps till greater knowledge enables us to draw forth their latent riches.

We have now marked, step by step, the long process through which iron passes from its original state; and no intelligent reader of these brief sketches can, it is presumed, be unacquainted with the *general* operations requisite for the production of the finished metal. The *coking*, with its fields of fire;—the *smelting*, developing iron in its first state;—the *refining*, liberating the metal still more from impurities;—the *puddling*, giving tenacity to the balls;—the *skingling*, with its combinations of gigantic powers and hammers;—the *heating* furnaces, forming the last attack on the latent impurities of the material;—and the *rolling* and *cutting*, in which the might of the steam engine is called in to complete the long series of labours,—have been described. To enter further into the subject, would be useless; for the general reader could feel no interest in minute details, and the manufacturer is fully aware of the whole process. One object of this paper has been, of course, to state the mode in which iron is made, and thus to invest some of the most common articles of daily use with that interest which must attach to the result of so many labours. To know the *history* of a piece of iron, will suffice to remove it from the circle of the common-place, and thus we shall be taught to deem many things important which are too often left in the tame circle of the uninteresting. The smallest bit of iron has engaged the cares of many heads, and the labours of many hands, and much of human thought is associated with its present existence. To know this, must open a fresh avenue through which numerous associations may enter the mind, and contribute to the increase of our pleasures, and the cultivation of our understandings. Another object of the article is to impress upon each reader, that *one fact*, or one useful substance, is often a result of multiplied agencies, one depending upon the other, and each in itself a cause and an effect of civilization. Such is the complexity of human progress, that innumerable operations are necessary to secure *one* result; and thus we may see how deeply laid, and widely spread, are the varied causes which act upon man to increase his knowledge and improve his condition. It is not *one* effort which produces the piece of cotton, or the bit of iron. Thus, the simplest thing we possess has occupied the careful thoughts of our fellow men in many parts of the land, or it may be of the world; and proves that the human family is linked, through all its tribes and gradations, by necessities which form a band stronger than adamant for forcing into closer fellowship the divided ranks of society, or the separated nations of the earth. Probably no man could *by himself* produce a piece of iron, no man a yard of cotton. Union and communion seem, then, the law by which civilization proceeds; and a recognition of this fact, and the receiving such a lesson from a bar of iron, may not be useless to us in this present age.

Here the subject, which is "The iron manufacture," might end, were it not that *steel* may be reckoned by

many readers included. A few remarks on this *species of iron* may, therefore, form a suitable termination to the foregoing sketch.

What is *steel*? This is a question, reader, which you must probably propose many times before a satisfactory answer can be given. You may ask, What? is there *mystery* in a material so common? If mystery be a something hidden behind a veil from human scrutiny, then certainly steel is a mystery, for we understand it not; that is, we know not the precise difference between it and iron. Thus the metallurgist has his mysteries equally with the divine, the moralist, or the metaphysician. All we know respecting the nature of steel, is, that it is iron in *some state* between pig and bar-iron; and, if melted, it becomes No. 1 pig-iron, which the reader will remember contains more carbon than the other kinds. Thus steel seems to have less carbon than pig, but more than bar-iron; though some suppose the carbon is more intimately mixed with the metallic particles in steel, and that this *union*, not a superabundance of carbon, is one cause of the peculiar properties of steel. A careful analysis generally gives the following proportions, from which it will be seen that other substances beside iron and carbon enter into steel.

Out of a hundred parts of cast steel, we have—

iron - - - - -	99.32
carbon - - - - -	0.62
silicium - - - - -	0.03
phosphorus - - - - -	0.03

The reader will thus see that silicium (the element of flint) and phosphorus are mixed with the iron and carbon. The period when steel was discovered is not known, but it has been manufactured in Styria since the eighth century, and may have been known for ages before.

The process by which iron is converted into steel must now be described. The metal used for this purpose is not of English manufacture, but principally Swedish or Russian, which is produced from ore more pure than our common ironstone, and smelted in charcoal furnaces. That from Sweden sells at a high rate, sometimes 35*l.* per ton, and is principally introduced into England by the Hull merchants; the best being from the mines of Danemora.

The iron bars are placed in vessels about twelve feet long, the bottoms being covered with charcoal to the depth of an inch, upon which a row of iron bars is placed, and over these another stratum of charcoal. Thus a layer of bars alternates with a layer of charcoal, till the vessel is full, which is then completely covered up by a thick bed of stones. All being ready, the furnace itself is also closed on every side with clay, and the fire being kindled, the vessels are left exposed to the heat for about six days, when a bar is drawn out from one of the closed vessels to test the progress of the *steeling* process. When the iron has become completely carbonized, the furnace is covered up with powdered coal, and left to burn out, and become cool, which requires a space of about fourteen days.

The great object in this process is to keep the vessels containing the bars perfectly air-tight, which requires the greatest care, as the intense heat tends to enlarge the minutest opening, and this would prevent the carbonization. The exact quantity of carbon required for the steeling process must neither be exceeded nor diminished, or the desired quality of steel will not be obtained. When the bars are withdrawn from the vessels, each is covered with blisters, which are, however, no proof of the superior quality of the iron, but rather an indication of defects, so that this *blistered steel* is not so much desired as formerly.

Those bars which are free from defects and blisters are at once rolled to the sizes required for the manufacturer. When the steel is required to possess a very fine texture, several of the steel bars are placed in a

furnace, and when softened are welded together, after which the combined mass is rolled into the shape wanted, and called *shear steel*, from which instruments requiring a fine edge are made.

Cast steel is now much used, instead of the shear steel, on account of its superior qualities: the manufacture of this is a modern discovery, the invention of Mr. Huntsman, about the year 1770, since which it has been extensively made. It is produced by melting bars of steel in a crucible, and pouring the fluid steel into moulds, after which the cold ingots are rolled into plates of the thickness wanted. The cakes of steel which come from India under the name of *wootz*, are an inferior kind of cast steel, the defects of which arise from the clumsy manner of conducting the casting process.

It is probably known to some readers that steel is hardened by plunging the heated bars into a cold fluid; and when the bars are raised to the greatest heat, and the fluid is very cold, the hardness will be of the highest degree. Thus, when extreme hardness is required, the heated bars are plunged into quicksilver, which being a rapid conductor of heat, produces the most sudden cooling of the metal. The numerous purposes to which steel is applied, renders it of the greatest importance that the utmost variety of hardness should be within the manufacturer's power to produce; and this is secured by the simple process of alternate heatings and coolings just described. Thus, in the steel plates used for engraving, the metal is softened, then graven, and afterwards hardened; by which process the labour of the engraver is made easier, for he has soft steel to work upon; and the durability of the plate is secured by the subsequent hardening. Some of the plates thus worked have been known to give 500,000 impressions; and, though this is a rare case, yet the average number of impressions, between 50,000 and 100,000, proves the great hardness of well tempered steel. Steel plates are, however, often used for engraving without the subsequent hardening, and are found sufficiently durable for common work, some of such plates producing 25,000 impressions. The method of first softening to receive the device of the workman, and the subsequent hardening, has been used in the Birmingham and Sheffield works for articles of furniture made from cast steel. These are softened to admit of receiving ornament, and afterwards tempered to the point required, by which an immense saving in labour is effected, and the durability of the article secured. We may, in conclusion, call the reader's attention to the beautiful and various colours exhibited by steel at different heats, and by which the operative formerly guided the duration of the tempering process. When steel is raised to the temperature of 300° Fahrenheit, it exhibits a pale straw colour, which passes into a yellow at 470°, and this to a brown at 500°; whilst a purple flush covers the steel at 530°, and a deep blue when raised to 600°.

Here must terminate our survey of the iron manufacture, all the great operations having now been detailed, from the first roasting of the ore to the production of the finest steel.

To enter upon the *prospects* of the British iron trade, and compare the products of the foreign forges with our own, is not within the scope of this article; but we cannot conclude without expressing our conviction that the greatest care is requisite to preserve our hold upon the markets of other countries, which have already commenced the manufacture for themselves. The advantage is, of course, on the side of the English manufacturer, who has his works and furnaces with all the organization of a long established system; and the researches of our chemists may probably lead to the discovery of further means for perfecting the various operations, and thus improving the quality, whilst they increase the quantity, of British iron. W. D.

RAMBLES IN BELGIUM.

No. III.—GHEENT.

GHEENT, though abounding in picturesque houses, quaint and fanciful decorations, and other illustrations of a city of the olden time, is not so strikingly and decidedly antique in its appearance as Bruges. There is more of life, too, in its streets. More business is stirring, more traffic, and more pleasure. In it are the same old and odd-looking squares and avenues, and the canal meanders on through its streets. The Hôtel de Ville is a handsome mixed Gothic building, but is inferior to the town-halls of Brussels or Louvain. Near the Fish-market stands a ruin of an old gateway, which was formerly a part of the castle of the Counts of Flanders, and in which the famous John of Gaunt, or Ghent, was born. On a house in the Padden-hoek is an inscription, which reminds the reader of the stormy days of Ghent. Here it was that the great Jaques Van Artavelde lived, and was murdered by the infuriated populace, whom he had so often studied to please. There is an immense cannon in the *Marché de Vendredi*, which the worthy host of the Hôtel Royal told me was called Mad Margaret. It is truly large enough to depopulate many a fair city, and must have been no small undertaking to move about from pillar to post.

One of my first visits was to the Cathedral of St. Bavon. The interior of the building is of very excellent proportions: on the altar are four candlesticks which were once the property of Charles the First; they are very large, and executed in copper, bearing the arms of England on their front side. There are a great many chapels in the aisles, in all of which are many very interesting specimens of the Flemish artists. St. Bavon renouncing a soldier's life, in order to enter a convent, is a *chef d'œuvre* of Rubens. The composition and general tone of the colouring in this picture may rank as amongst the finest efforts of this great master. The Adoration of the Lamb, by the brothers Van Eyck, is a most extraordinary painting. The immense number of personages grouped together are finished with a wonderful minuteness, that no description of mine can by any means portray. It occupied a good hour inspecting the works of art in this cathedral. I cannot forgive the authorities for having placed a statue of St. Bavon on the altar, and fixing their fine Rubens in the situation it is now in; it is a change for the worse. The information I received on quitting the cathedral, determined me to direct my steps at once to see a collection of flowering shrubs, chiefly American, which adorned a garden in the suburbs. The azaleas were very fine, and some amongst them larger than any which are generally exhibited at Chiswick. Unfortunately, this tribe were all out of flower; so that I could not see the Azalea Tricolor in all its glory, or witness the beauties of their pink and striped varieties. The rhododendrons were not nearly so large as specimens to be seen on many an English lawn; while the Andromedas were miserably poor in comparison with the commonest sorts in our own gardens. How true is that axiom which cannot fail to come home and make itself felt to every roving heart! "We never value our own possessions till we have travelled and returned home;" true and just in every sense of the expression.

Returning to mine inn, and despatching an excellent repast at the *table d'hôte*, I made up my mind, in company with some young Englishmen out on their adventures, to pay a visit to the famous *Béguinage*, a convent founded in the thirteenth century, and differing in many very remarkable respects from any other religious establishment. The nuns are at liberty to re-enter the world at any time after their profession: it is right to state, that no example of such a departure

from their seclusion could be stated by the nun who acted as porter and cicerone. They live in several small houses, four or five together: these habitations are all in one inclosure, which separates them from the world without. Their costume consists of a gray gown with a white head-dress. The evening mass began at their old church, so that we were obliged to conclude our tour of inspection rather hastily. The name Béguin is derived from the muslin they wear on their heads. Their peculiar vocation appears to be visiting the sick and needy; the townspeople give a very good character of them, and reported favourably of their kindness on many occasions. They are very industrious, and make lace, the proceeds being devoted to the general funds of the Society.

The grey light of evening fell upon tower and tree, as I found myself entering St. Michael's church; which possesses one of Vandyrke's finest works, the Crucifixion: it is a picture likely to astonish those persons who have known this artist only through the numberless portraits so freely distributed in many of the private collections of the English nobility and great landed proprietors. The hour being late, and the principal figures having suffered from repeated washings and cleanings, I could not see it in perfection. Enough light remained to desery a magnificent horse, painted with a freedom and boldness of touch most admirable. One might imagine the animal about to leave the canvass. After witnessing my silent admiration, I was accosted by a young Frenchman on the subject, whose observations were very amusing, and something characteristic of his native clime. "*Chacun à son gout; pour moi, je n'aime pas ce cheval-là; ce n'est pas religieux.*" What description of steed would have filled the measure of his expectations I could not find out; he evidently however thought himself a connoisseur of no common order, and became angry with me for differing from him in opinion as to the relative merits of this *chef d'œuvre*, and one in the same church by De Crayer. There was some difficulty in tearing oneself away, but the moon was rising, and the Hall of the Watermen to be seen. Very picturesque it is, situated on the Quai aux Herbes, and presenting a most excellent type of the old halls of the guild, when Ghent raised its head high above all other towns for the importance and extent of its commercial transactions. The front is decorated with some curious stone carvings, and is enriched with several Saxon arches. A promenade by the side of the canal showed the old city to every advantage, especially as the moon was particularly bright, and the absence of the overpowering smoke threw additional lustre on the gable ends and fantastic exteriors.

Early morning afforded an opportunity of seeing the farming peasantry to every advantage.

It was market day in the *Marché du Vendredi*, and the linen sellers were stationed in long rows, talking in the Flemish dialect, a tongue not apparently remarkable for sweetness or elegance of idiom. Their movements appeared heavy, and their stature, generally speaking, short. I had the temerity to taste some beer which they are fond of, and occasionally resort to to recruit themselves with: I was severely punished for my pains; it was a draught of knowledge I never wish to renew on any future occasion. There were several vendors of fruit and vegetables; the women lightly attired, the men in their grey blouses and sabots, the latter making a great clatter whenever they moved. At one time the way in which they despatched their business was noisy in the extreme; then followed a long silence, interrupted by fresh arrivals on the busy scene. An inspection of a linen manufactory afforded some subject for surprise and national exultation, inasmuch as the steam engines and many other useful adjuncts were English made. The articles for sale in the shops are reasonable enough, though possibly not so cheap as before the giant power of steam worked its noisy way

to Ghent, and brought new wanderers with every fresh hour.

The *Jardin des Plantes*, like the collection, before spoken of, disappointed the expectations formed of it; this was the case too with the *Palais de Justice* and the *Théâtre*, both of which are modern erections. It is customary, at the latter, to give the best representations on Sundays; a fashion highly revolting to the purer sentiments and rest-loving tastes of an Englishman.

The great charm of Ghent lies not in the separate parts of the city, but the aggregate view of it, which will be found fully to realise any pre-conceived notion of a town in the Low Countree, as described in the pages of Froissart and other chroniclers. The traveller should put in his trunk Taylor's Philip Van Artavelde, and take the opportunity, after a quiet ramble through these antiquated streets, of reading that charming drama; every alteration of event, of scene, and time, will be felt and enjoyed with a double pleasure. So peals the *carillon*, to prate how fast the hours fly, and to warn that this same old Ghent must not monopolize all consideration. Other towns await the signal of the railway trumpet.

THE WANDERER'S RECEPTION.

CHAPTER VII.

LITTLE Bessie seemed to become dearer to old Robert every day; and Mary never ceased to thank the Giver of all good things for the treasure she proved to her. Although so young herself, she felt fully aware of the responsible duties she owed to her charge, and had so many around to direct and assist her in the care of the little one, that Bessie had no cause to wish for any other protection. She soon learned to know different persons, and, to the delight of Mary, attached herself warmly to Ellen. Miss Stanmore spared no pains to win the child's love, and thus gained an influence over her which, in after years, became of the greatest advantage: she superintended all that was taught her, and herself instructed her in the duties, the performance of which she had vowed for the child at its baptism. She trained her in the principles that a true member of the church should embrace, and with great anxiety watched over the first impressions the child's mind received. The poor orphan soon repaid her care by becoming all that she desired. Her merry laugh and happy clear voice as often echoed through the rooms at the Hall as at the cottage, and Mary was never so contented as when she spent a day with Bessy and Trust at Mrs. Stanmore's. When Miss Francis left, and the spring returned, the rides to the ruin were resumed, the baby now being old enough to sit before the rider, and on those expeditions seemed even happier than at other times. While her elders pursued their studies and employments in the woods, she amused herself by picking the wild-flowers that grew round them, bringing them to Mary to twist into wreaths. In this manner did little Bessie gain health and strength, and learned to find her own amusements without troubling others. For Ellen Stanmore she always felt the greatest respect. Mr. Beverley also took much interest in the child, and exerted his efforts to lead her to the knowledge of what would bring her happiness on earth and perfect joys hereafter. He would sometimes join in their walks and rides, and entered warmly into their pursuits. Amongst other arrangements which Robert made use of for teaching the children their duty, a box, with a hole in the lid, was placed on a table in his little parlour, which was to receive any halfpence for the poor which the children might collect, and feel willing to bestow in so worthy a manner. Twice a-year the box was broken open, and the sum within sent to Mr. Beverley, to make use of as he thought fit. None knew

what the others put in. Mary longed to see little Bessie able to understand the privilege of adding any mite which she might possess, and was constantly explaining to her the use and purpose of old Robert's box, as well as the duty, that all ought to feel it to be, to contribute. When a little better able to comprehend all she was told, the child gratified Mary's desire. The latter was one morning seated at the window watching the child, who was playing by the gate, when she observed a gentleman stop and speak to Bessie; he seemed struck with her laughing, merry little face, and when he passed slipped something into the child's hand. She instantly ran into the cottage, went straight to the box, and put in what she had received; she had not observed Mary, and returned with increased glee to play in the garden. Mary's heart beat with gratitude at the child's unhesitatingly parting with the first money she had ever possessed, while she knew she was fully aware of the indulgences it would have procured her, as she had often begged for some trifle when anything in the shop windows in the town tempted her. Bessie could not be expected to understand the full meaning of what she had done; she could not yet feel the advantages of the rich rewards so mercifully promised to those who attend to this most happy and delightful duty, for His sake who gives us the will and the power to serve Him. Mary wished to teach her the privilege and honour of being permitted to offer the first fruits of all our possessions to Him who, for our sakes, became poor; she rejoiced that the child had so early been led to practise what she had learnt, and dared to hope that at some future time she would make her offerings systematically—not from impulse or feeling, but acting conscientiously on the heavenly encouragements and motives held out in the Bible, with thankfulness and self-denial, persevering amidst the ridicule of others, and viewing charity and almsgiving not as a merit, but a high favour allowed us by God. Mary wished much to know what the child had contributed, but would not question her about it, as she had believed herself unseen. The day was not very distant when the collection was to be carried to Mr. Beverley, and she then thought she might discover. From the sound of the coin when it dropped into the box, it appeared smaller and lighter than halfpence, and was most likely to be silver. Mary carefully watched the children who crowded round to examine the treasure when the box was broken open, and observed that little Bessie took more interest than she had ever done before. Robert was astonished to find silver, and when he took out the sixpence they all seemed surprised at it. It was a larger sum than they generally had at their command. None of the children suspected Bessie, the youngest of the party; but Robert checked all inquiries, as it was a rule never to discuss what each had contributed. Mary saw that Bessie's cheek glowed, and she seemed relieved when all the money was put by to be carried to the parsonage. Mary cherished with gratitude these signs of Bessie's character, and fondly hoped she would continue a blessing to them all. Although Mary's attention was much engaged by her duties at home, she was not so entirely engrossed with the child to forget what concerned others; and for some little time past had observed that Miss Stanmore walked less frequently to their cottage; and, when a fine day tempted them any distance from home, she generally seemed too much fatigued to enjoy their rambles. This change in her friend made Mary very uneasy; but, as no one else seemed to notice it, she hoped there was no great cause for alarm. Her fears were, however, one morning confirmed by a visit from Mrs. Stanmore. She seldom came so far, and as she placed a chair for her, Mary anxiously inquired how Ellen was.

"It is on her account I have come. I have often observed lately, that my dear child did not appear as healthy as usual, but, as she did not complain of any malady, I fear I have allowed her to neglect her health

too long: a medical man who came to see me yesterday pronounces her to be very delicate, and I have come to you, Mary, to beg your assistance during her illness."

Not to be ready to do all in her power to benefit Ellen seemed impossible; and she would instantly have promised to do all required of her had not Mrs. Stanmore gently stopped her.

"You must first listen to what I propose. Change of climate has been recommended to Ellen, and I shall start as soon as I can to spend the ensuing winter in Italy. My daughter is much averse to the separation from her home and friends for such a length of time, but readily accedes to my wishes. I am very anxious that you should come with us, Mary, and, by the affectionate care and attendance which I know you would give, assist Ellen to bear the separation from all whom she leaves in England."

Mary was too much perplexed and surprised to answer; and Mrs. Stanmore, desirous of giving her time to recover herself, turned to Robert, and urged him to agree to her request. The old man seemed nearly as much affected as Mary. The news of Ellen's illness grieved them both, but he quickly regained his composure, and refused to influence Mary by his opinion: he declared that she should decide for herself entirely.

"She shall certainly do so; but I must explain to you my intentions. Money would, I am sure, be the least attraction to either of you, but I am so well aware of what I should take from you, that, besides a handsome remuneration to Mary for her services while with me, I propose, Robert, to leave a sum of money in your hands to obtain the necessary assistance you would require in the house, and the care of Bessie."

As the child's name was mentioned, she ran into the room, respectfully answered Mrs. Stanmore's kind notice, and, jumping into Mary's arms, asked why she did not come to her in the garden. The presence of the child completely roused her affectionate nurse, and she eagerly begged Mrs. Stanmore not to tempt her to forsake the motherless little being who claimed her presence and care.

"I would," she added earnestly, "if I thought I should be right in listening to inclination, leave even my dear little Bessie and my grandfather for a time; but as I am sure it would be wrong, I should not have a moment's satisfaction. I would sacrifice a great deal for Miss Ellen's sake, but she cannot wish me to neglect my duty. I cannot allow myself to consent to go with you, even though it be to attend Miss Stanmore."

Old Robert affectionately pressed her hand as she finished speaking, and Mary felt now quite reconciled to her determination. Mrs. Stanmore appeared disappointed, but told Mary she should be glad to see her again on the subject the next day. "I cannot, Mary, so easily relinquish a plan that would be so great a delight to Ellen, and in which no pains should be spared to give you enjoyment."

"I do not doubt your indulgence, my dear madam; but I think I shall decide in the same way to-morrow. Do not let Miss Stanmore think I slight her friendship."

"She does not know that I am come here. I purposely avoided mentioning my intentions to her until I had seen you."

Mary was quite right in her belief that she should not change her opinion. The next day, she felt then even firmer in her resolution, although at times she longed to be able to go; the reflection that her care might lighten her friend's sufferings, was very tempting; the opportunity was presented when she might prove the sincere gratitude and affection that she felt towards her benefactress. Such thoughts agitated her, but she would not permit her mind to dwell on them, and, when she arrived at Mrs. Stanmore's, she firmly repeated her determination not to forsake Bessie. This kind lady would not press her again. She felt sorry for the pain which it gave the girl to refuse, and could not but

approve of her desire to act as she thought right. Ellen had heard of the proposal, and did all she could to strengthen Mary. She considered that she had decided for the best, and, whenever they were together, employed her in the arrangements of the journey: she was cheerful herself, and talked of the pleasure they should feel if she were restored to health, and able to return and meet her friends after so long an absence. Mary had so long sought for comfort and direction from Ellen, and was so well aware of the improvement and pleasure to be derived from her society, that the separation was much dreaded; but Miss Stanmore, although weak and suffering herself, spared no pains to raise the spirits of all round her; and the day when she took leave of them was much less melancholy than they expected.

Mary now devoted herself more to Bessie than ever, and determined to do all she could that the child might not miss her instructress, and thought only of the satisfaction and reward it would be to her, if Ellen, on her return, found Bessie as much improved as she expected.

CHAPTER VIII.

EVERY day that brought fresh strength and knowledge to Bessie, made a still greater, though very different, change in Robert. The poor old man suffered much in the winter from rheumatism, and depended entirely on the two little girls for his comfort and amusement. While Mary was busy with her household duties, Bessie, seated on a stool by the side of his chair, in her childish language would give him long accounts of their walks and visits to Mrs. Adams, at the now deserted Hall. While watching her artless endeavours to make herself understood, and to amuse him, Robert, for the time, forgot his pains. He often longed to be able to see her father receive from his child the domestic joys and comforts which his wife's death had taken from him; he often tried to accustom her to believe, that, should he ever return, she owed to him the obedience and attentions that she now bestowed on her grandfather. But no news had been heard of her parent since his wife's death; and, although they sometimes spoke of his coming, no one appeared to expect him: Mary, who feared he might take the child from them, always felt averse even to hearing the event talked of. Robert had become quite intimate with Mr. Beverley, and it seemed the greatest relief to him to be able to talk unreservedly to such a considerate friend. He felt happy in the idea that his two girls were surrounded by those who would watch over them when he was taken from them; he did not allow such anxieties to press on his mind, and tranquilly awaited the end of his mortal life, which, from his age and the trials he had undergone, he felt sure would not be very distant. To Martha Robert proved as great a blessing as she had hoped he would be. Her children learned to value his precepts, and soon found that obedience and constant endeavours to do what was right, brought them far greater happiness than their former carelessness had ever afforded them. Robert was never tired of repeating to them the advice of his former master, and contrived various ways of showing them practically what they ought to do. He treated all the younger branches of the family as his grandchildren, and watched their improvement with heartfelt satisfaction. In the course of time they entered upon their different modes of supporting themselves; and some left their father's house to follow the employments which they had adopted. James remained at home to superintend the farm, and showed no inclination to leave his parents or his cousin Mary.

The winter that Miss Stanmore spent abroad seemed a very long one to her friends, and, when the spring returned, all rejoiced in the idea that she would soon come back to them; but so many objects of interest presented themselves on the way home, that Mrs. Stanmore was tempted to linger, and it was late in the summer before the family arrived. Mary had been so

anxious, that Mrs. Adams promised to send her word directly she had seen Miss Stanmore. For several days the message was expected, and being disappointed, she determined to go and see if any fresh intelligence had been received. As she could not leave home until late in the evening, she first put Bessie to bed, and made Robert comfortable in his easy chair. Robert had begged her cousin James to walk with her, as it would be so late and dark when she returned. The two cousins, happy in having an opportunity of enjoying the beauty of the evening, walked merrily to the Hall, where they found they were just in time to receive the travellers, Mrs. Adams having a few hours before heard that they would reach home that night. She had not forgotten her promise to Mary, but was very glad she had come to spare her the trouble of sending. Mary readily assisted in the preparations, but, on hearing the carriage stop at the park gates, she left James to finish what she was doing, and ran towards it, impatient to catch a glimpse of Ellen. Miss Stanmore had alighted once more in her own house, and the two girls were soon walking side by side. The restoration of the latter's health was the chief subject that interested Mary; and, when she had learnt that her kind friend was perfectly recovered, and had given a rapid account of Bessie, she would not indulge in further conversation, and departed, with the hope of soon meeting again. As Mary walked back with James, she amused him with her gay spirits. She could scarcely control the joy she felt, and chattered and laughed so heartily, that she did not notice they had entered the village, until he reminded her that they were now at Mr. Beverley's, and she had promised to inform him of their friend's safety. Mary felt quite ashamed at having so nearly forgotten her errand, and asked her companion to wait while she gave the message, telling him she should soon come to him, as Robert and Bessie would also be glad to hear the news. She was not very long speaking to Mr. Beverley, and when she joined her cousin she was surprised to find a stranger with him. He immediately turned towards her, and explained why he addressed them. She had mentioned the names of two persons he was now seeking, and entreated she would give him all the particulars she could relating to them, as he thought they must be the same. Mary was almost frightened at the agitation and eagerness with which the man spoke, and gladly left it to James to answer him. After asking several questions, the man enquired whether they would take him to see the old man and child of whom they were speaking. Mary did not think it was quite right the stranger should wish to disturb them at so late an hour, and told him she thought he had better wait until the next day. "I cannot," she added decidedly, "wake the child without knowing that your reason is a good one."

"Suppose," replied the man, in a tone that bespoke his interest, "you were a parent, seeking a long-lost child, would you like to be kept several hours in suspense, when you hoped that you had found her?"

James, who had before suspected the truth, now in his turn made many enquiries; and the result was, that all three were persuaded he was Bessie's father. It was impossible to object to his seeing his child, and Mary hastened forward to tell Robert of the meeting, while her companions lingered outside. She feared the old man was not strong enough to bear any sudden emotion, and, as gently and as gradually as she could, she related all that had passed. The stranger was called in, and when Robert saw him, there was no longer any doubt. The last time they had met was on so painful an occasion, that both were much affected. Mary saw that her grandfather was unable to take him to his child, and accordingly begged that he would follow her; shading the candle with one hand, she drew near to the bed. The unconscious little one received her father's kiss in ignorance of the deep feelings she had excited in his heart. She greatly resembled her mother, and a thousand painful recollections crowded into his thoughts.

Before he turned from the bed-side he resolved never again to forsake the dear child who was now so mercifully restored to him, but to devote his remaining days to her, who would henceforth be his greatest earthly happiness. When they returned to the sitting-room, Mary entreated that Robert might be spared further excitement that night; he was quite exhausted, and required the night's repose. With reluctance they were obliged to separate, James taking the traveller to the farm. He was to see Bessie again early the next morning; he dreaded lest his child should treat him as a stranger, and refuse his caresses; but Mary promised to prepare her for the meeting. The child had experienced so much affection from all around her, that she never doubted her father would love her, and returned his embrace with so much confidence, that all his fears were dissipated, and they were soon intimate. The previous evening Mary had had a severe struggle with her own selfish feelings: she much dreaded a separation from her little darling, and had with difficulty persuaded herself to feel rejoiced at the event, but when she saw the child's head resting on her father's shoulder, her laughing eyes fixed with wonder on his sunburnt countenance, and delighted with finding herself so petted, while the father first blessed his child with heartfelt emotion, and then turned to thank Mary for her care of his treasure, she no longer grieved, but joined in their happiness. Robert seemed much relieved by his son's return, and made him his chief companion and attendant. Mary, who had refused to leave him or Bessie while they so much needed her care, now felt in a great measure released from such constant watchfulness, and, with the consent and approval of all interested in her, returned to her uncle's house as James's wife. Martha had long loved her as dearly as her own children, and with great satisfaction resigned to her the active duties which she had fulfilled for her husband and family.

Bessie remained some few years at the farm with Mary, until she was old enough to return to the cottage and assist her father in his attendance on Robert. He had acquired some little money in America, and, delighted in bestowing every comfort he could think of on the old man, he spared no pains to prove how sincerely he repented the trouble which he had caused him in former days. Mary and Miss Stanmore rejoiced in seeing their dear Bessie fulfil their fondest hopes, and were happy in still having her near them. The day when Mary first showed kindness to Robert was always noted as a joyful anniversary. All felt thankful for the blessing he had proved to them, and gratefully acknowledged the mercy of the Great Giver of all good things, who had guided them to so much happiness, by the virtue of Christian Charity.

SPRATT AND FORBES'S LYCIA.¹

It is impossible to estimate at too high a value the noble efforts that have been made within the last few years, to enlarge and extend our knowledge of that part of Southern Asia which is named Lycia. The British Museum has that within its walls which testifies to the enterprising spirit of Sir Charles Fellows; the Xanthian marbles are a worthy manifestation of his ceaseless zeal. Subsequent to their arrival, Mr. Watkins Lloyd produced an essay, so elegantly composed, so replete with thorough knowledge and appreciation of the subject, and withal so profoundly imbued with classical spirit and research, that it will bear

a comparison with any work of a like character, ancient or modern.

There are in these volumes many very interesting particulars, many discoveries of the most informing nature, and very agreeable and entertaining descriptions of the researches made among the mountains. A melancholy feature, appertaining to the work, consists in the death of the Rev. E. Daniell, a most intelligent traveller, who died from the effects of his exertions in the pursuit of all that could enlighten mankind with respect to this interesting country. This gentleman had intended publishing a work of the same nature as the present, but was taken away, ere he had finished collecting the materials. An apology is made by his fellow workers, for which there seems little occasion, as they have executed their designs nobly, and have presented the public with two volumes which are calculated to improve our acquaintance with Lycia to a very considerable extent.

The sites of no fewer than eighteen cities were explored and determined during these investigations and researches. The situation of the pleasure houses of the Turks, are chosen with an evident appreciation of the beautiful. The description of Tlos is very well drawn.

"We remained three days at Tlos. It is a most delightful place. Few ancient sites can vie with it. Built on the summit of a hill of great height, bounded by perpendicular precipices and deep ravines, commanding a view of the entire length of the valley of the Xanthus; the snow-capped Taurus in one distance, the sea in another; the whole mass of Cragus and its towering peaks and the citadel of Pinara in front; itself immediately overhung by the snowy summits of the Massicytus,—a grander site for a great city could scarcely have been selected in all Lycia. Pinara has, perhaps, more majesty; but there is a softness combined with the grandeur of Tlos, giving it a charm which Pinara has not.

"The acropolis hill terminates on the north-east, in perpendicular cliffs. These cliffs are honey-combed with rock-tombs, some of which are of great beauty. The older tombs are similar to those at Telmessus; but there are others, of an apparently later period, having their chambers excavated in the rock, but with the doorways regularly built. Such tombs have often long Greek inscriptions. The oldest tomb, to all appearance, at Tlos, is the largest and most interesting. It is a temple-tomb fronted by a pediment, borne on columns of peculiar form and Egyptian aspect, having no carved capitals, and being wider at the base than at the upper part. From such columns the Ionic might have originated, for we can hardly suppose this, apparently the most ancient and important tomb in Tlos, to have been left unfinished. Within the portico is a handsome carved door, or rather imitation door, with knocker and lock, on each side of which are windows opening into large tombs. On one side of the portico is carved a figure, which we may recognise as Bellerophon, mounted on Pegasus, and galloping up a rocky hill, which may represent Mount Cragus, to encounter an enormous leopard sculptured over one of the tomb entrances on the right side of the door. This animal may be a form of Chimera, but presents none of the mythological attributes, and is, in all probability, the representation of a "caplan," the leopard which infests the crags of Cragus at the present day. An ornamental flourish appears on the door side near the leopard, and

(1) *Travels in Lycia, Milyas, and the Cibyratis*.—By Lieut. Spratt, and Professor Forbes. London, Van Voorst, 1847.

is repeated on the corresponding panel on the other side; but there is no animal carved on that panel. On the panels beneath the tomb are carved dogs, and there are also traces of others on the pediment. Pegasus is a Persian horse, having a top knot and knotted tail. A saddle cloth of ornamental character has been painted on his back. The group of figures appears to have been originally painted. The head dress of Bellcrophon is very peculiar, as also the arrangement of the beard. The eye is rather full and Greek. There is no inscription on the tomb. A few feet from it, on a level with the pediment, is a Lycian inscription in a panel on the rock, the characters of which are much larger than any we have met with elsewhere. Two other Lycian inscriptions occurred at Tlos; one on a tomb on the opposite hill, and another on one near the base of the acropolis hill. None of these had been previously noticed."—Vol. i. p. 33.

A curious superstition prevails at Isna, where a stone is believed by the peasantry to contain a treasure, and that any one attempting to break it to possess the interior, is instantly deprived of the use of some of his limbs, or even life. All attempts to reason them out of this belief are utterly thrown away. It would seem that the party were greatly annoyed by the Turkish dogs, who barked and bit their horses, and would not upon many occasions be quieted until they had smelt gunpowder. Generally speaking, the inhabitants afforded every facility for the comfort, convenience, and information, of the scientific inquirers. Gipsies are numerous, and are incessant beggars.

"The gipsies abound in this neighbourhood, and plagued us when working among the tombs, the women unceasingly asking for money. Some of the girls were pretty, and there is a grace and air about the Chingunee women which the Turkish and Urook females cannot boast of. Some had tambourines, and others sang the wild airs of their tribe. They dress in the fashion of Turkish women, but do not veil the face. A white scarf is twisted round the head, and partly covers the chin; and the body shawl is usually particularly coloured, bright green and bright red.

"The men are cattle dealers, and tinkers; and, though dressed as Turks, are easily distinguished by their countenances and lively manner,—not the busy liveliness of the Greek, but the wild gaiety of the Zingari."—Vol. i. p. 152.

It is satisfactory to know, that Mr. Sharpe's conclusions as to the coins to which he has paid so much attention, were fully borne out by the observations of Professor Forbes. The finding the site of Termessus is thus graphically related:

"Early in the morning we commenced the ascent of the mountain, to seek for the ruined city. The first part was over steep and rocky ground, but after a time we came upon an ancient roadway, leading towards an opening in the mountain side between two towering rocky peaks. Following this road, which was buried in trees, and encumbered by underwood, for an hour and a half, we suddenly came upon two ancient guard-houses, almost perfect, one on either side of the way. We did not linger to trace any connecting wall, but hurried anxiously on with sanguine expectations. For nearly a mile we met with no other traces of ruins. Some sarcophagi were at length discovered among the thickets, and near them on the face of a great rock were carved in large letters the words

“ΠΑΤΟΝΙΚΟΝ
ΦΙΛΟΧΟΡΟΝ.

"Suddenly, after crossing a low wall, we emerged from the thicket, and entered an open and flat area

between the two great rocks, and walled in by inaccessible precipices. On it ruins were profusely scattered: numerous built tombs and sarcophagi, fallen buildings of large size, and a temple, the ornamented doorway of which still stood, fronted by a goodly flight of steps. Fluted columns of large dimensions lay strewn in fragments on the ground. Unwilling to delay until we had ascertained the full extent of the city, after a hasty glance, we proceeded to the upper end of the platform. Here the valley became more contracted, and a strong and perfect wall was thrown across it. Within this, ruins of a nobler style and more perfect preservation appeared, especially a palatial building of great extent, having numerous doors and windows, and almost perfect to the roof: like the others, it was constructed of rectangular blocks of lime-stone, without intervening cement. Before us, on what appeared to be the mountain top, a third wall appeared, to which we ascended, expecting to find the acropolis: Hitherto we had met with no mention of the city in any of the inscriptions; but on ascending to the last-mentioned wall we came upon an inscribed pedestal, which assured us we were in Termessus,—a name shouted out by the finders with no small delight, and echoed by the old rocks as if in confirmation. It must have been new to them after having rested so long unspoken.

"On reaching the third wall, our surprise was great at finding that hitherto we had been wandering, as it were, only in the vestibule of the city, and that Termessus itself was yet to come, built on the mountain top, even as Arrian has recorded. It stood on a platform surrounded by a natural wall of crags, three to four hundred feet high,—except on the east, where it terminated in a tremendous precipice, diving into a deep gorge, opening into the Pamphylian plain.

"After crossing the third wall, our attention was first attracted by an avenue, bordered on each side by a close row of pedestals, terminated at each end by public buildings, apparently temples. These pedestals were almost all inscribed, and the inscriptions in good preservation. One of them was of peculiar interest, confirming this site as Termessus Major."—Vol. i. p. 232.

It is an old saying that "travellers see strange things," and is confirmed in these volumes, for, in an account of the habits and actions of the stork, we are told that they invariably give the preference to the habitations of the Turks, and shun the intercourse of the Christian population. The history of the matter seems to solve itself in the fact that the one encourages their contiguity, whilst the other (the Greeks) drive them away.

This notice cannot be better concluded, than by giving the following extract of the farewell to Xanthus.

"From the sharp and narrow summit of this lofty peak we enjoyed our last look over Lycia: below us lay the whole expanse of the Xanthian plain, and beyond we could see far into the gorges and valleys of Massicytus, now as familiar to us as the hills and valleys of our native land. In the bird's-eye view before us, long journeys of miles and hours appeared as brief spaces asunder; and the labyrinth of hills and crags we had so lately trodden, seemed levelled into plains and gentle undulations. Such is the steepness of Cragus, that its precipices plunge from the snowy summit to the sea, and from the lofty pinnacle on which we stood we could see the waves breaking white against its base. This was a fine spot from which to bid farewell to a beautiful land, nor did we descend without sensations of regret."—Vol. i. p. 301.

Poetry.

[In Original Poetry, the Name, real, or assumed, of the Author, is printed in Small Capitals, under the title; in Selections it is printed in Italics at the end.]

MARY, QUEEN OF SCOTS.

It was a stately convent, with its old and lofty walls,
And gardens with their green walks, where soft the footstep falls;
And o'er the antique dial-stones the creeping shadow past,
And all around the noon-day sun a dreamy radiance cast;
No sound of busy life was heard, save from the cloister dim,
The tinkling of the silver bell, or the sisters' holy hymn.
And there five noble maidens sat, beneath the orchard trees,
In that fresh-budding spring of youth when all its prospects please:
And little recked they when they sang or knelt at vesper prayers,
That Scotland knew no prouder names, held none more dear,
Than theirs;
And little e'en the loveliest thought before the Virgin's shrine,
Of royal blood, and high descent, from the ancient Stuart line;—
Calmly her happy days flew on, unnumbered in their flight;
And, as they flew, they left behind a long-continuing light.

The scene was changed. It was the court,—the gay court of Bourbon,—

And 'neath a thousand silver lamps a thousand courtiers throng;
And proudly kindles Henry's eye, well-pleased I ween to see
The court assemble all its wealth of grace and chivalry;
Grey Montmorency, o'er whose head has passed a storm of years,
Strong in himself, in children strong, the first among the peers.
And next the Guises, who so well Fame's steepest heights assailed,
And walked Ambition's diamond ridge, where bravest hearts had failed;

And higher yet their path shall be, stronger shall wax their might,
For before them Montmorency's star shall pale its waning light.
Here, Louis, Prince of Condé, wears his all-conquering sword,
With great Coligny by his side, each name a household word!
And there walks she of Medicis—that proud Italian line—
The mother of a race of kings—the haughty Catherine.

The forms that follow in her train a glorious sunshine make,
A milky-way of stars, that give a comet's glittering wake.
But fairer far than all the rest who bask on Fortune's tide,
Effulgent in the light of youth, is she, the new-made bride;
The homage of a thousand hearts,—the fond deep love of one;
The hopes that dance around a life whose charms are but begun;
They lighten up her hazel eyes; they mantle o'er her cheek;
They sparkle on her open brow, and high-souled joy bespeak.
Oh! who shall blame, if scarce that day, through all its brilliant hours,

She thought of that quiet convent's calm,—its sunshine and its flowers?

The scene was changed. It was a bark that slowly held its way;
And o'er its lee the coast of France in the light of evening lay;
And on its deck a lady sat, who gazed with tearful eyes
Upon the fast-receding hills that dim and distant rise.
No marvel that the lady wept,—there was no land on earth
She loved like that dear land,—although she owed it not her birth!—

It was her mother's land,—the land of childhood and of friends;
It was the land where she had found for all her griefs amends;
The land where her dear husband slept; the land where she had known

The tranquil convent's calm repose, and the splendour of a throne!

No marvel that the lady wept,—it was the land of France,—
The chosen home of chivalry,—the garden of romance:

The past was bright, like those dear hills so far behind her bark;

One gaze again,—one long last gaze,—adieu, fair France to thee!

The breeze comes forth, she is alone on the unconscious sea.

The scene was changed; it was an eve of raw and sullen mood;
And in a turret-chamber high of ancient Holyrood

Sat Mary, listening to the rain, and sighing with the winds,
That seemed to suit the stormy state of men's uncertain minds;
The touch of care had blanched her cheek—her smile was sadder now;

The weight of royalty had pressed too heavy on her brow;
And traitors to her counsels came, and rebels to the field;
The Stuart sceptre well she swayed, but the sword she could not wield.

She thought of all her blighted hopes—the dreams of youth's brief day—

She summoned Rizzio with his lute, and bade the minstrel play
The songs she loved in early years, the songs of gay Navarre;
These songs, perchance, that erst were sung by the gallant Chatelard;
They half beguiled her of her cares, they soothed her into smiles,
They won her thoughts from bigot zeal, and fierce domestic broils;

But, hark! the tramp of armed men—the Douglas battle-cry!—
They come! they come! and to the scowl of Ruthven's hollow eye;

And swords are drawn, and daggers gleam, and tears and words are vain—

The ruffian steel is in his heart—the faithful Rizzio's slain!
Then Mary Stuart brushed aside the tears that trickling fell:
“Now, for my father's arm!” she said; “my woman's heart, farewell!”

The scene was changed. It was a lake, with one small lonely isle,

And there, within the prison walls of its baronial pile,
Stern men stood menacing their Queen, till she should stoop to sign

The traitorous scroll, that snatched the crown from her ancestral line:—

“My lords, my lords,” the captive said, “were I but once more free,

With ten good knights on yonder shore, to aid my cause with me,
That parchment would I scatter wide to every breeze that blows,
And once more reign a Stuart Queen o'er my remorseless foes!”
A red spot burned upon her cheek, streamed her rich tresses down,

She wrote the words—she stood erect, a Queen without a crown.

The scene was changed. A royal host a royal banner bore,
And the faithful of the land stood round their smiling Queen once more.

She staid her steed upon the hill—she saw them marching by;
She heard them shout; she read success in every flashing eye:
The tumult of the strife begins—it roars—it dies away—
And Mary's troops and banners now, and courtiers, where are they?

Scattered, and strewn, and flying far, defenceless and undone!
O God! to see what she has lost, and think what guilt has won!
Away! away! thy gallant steed must act no laggard's part;
Yet vain his speed, for thou dost bear the arrow in thy heart!

The scene was changed. Beside the block a sullen headman stood,

And gleamed the broad axe in his hand, that soon must drip with blood.

With slow and steady step there came a lady through the hall,
And breathless silence chained the lips, and touched the hearts of all;

Rich were the velvet robes she wore—her white veil round her fell—

And from her neck there hung the cross—the cross she loved so well!

I knew that queenly form again, though blighted was its bloom;
I saw that grief had decked it out an offering for the tomb!
I knew the eye, though faint its light, that once so brightly
shone;

I knew the voice, though feeble now, that thrilled with every
tone;

I knew the ringlets, almost grey, once threads of living gold;
I knew that bounding grace of step, that symmetry of mould!
E'en now I see her far away, in that calm convent's aisle;
I hear her chaunt her vesper hymn—I mark her holy smile.
E'en now I see her bursting forth, upon her bridal morn,
A new star in the firmament, to light and glory born.

Alas, the change! She placed her foot upon a triple throne,
And on a scaffold now she stands—beside the block—*alone!*
The little dog that licks her hand, the last of all the crowd,
Who screened themselves beneath her glance, and round her
footsteps bowed.

Her neck is bare—the blow is struck—her soul has passed away!
The bright—the beautiful—is now a bleeding piece of clay.
Go—think of this in silence, and alone—

Then weigh against a grain of sand the glories of a throne.

From an Old Manuscript.

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne.*

MOUNTAIN SCENERY.

It may, at least, be doubted whether the love which the inhabitants of mountain districts bear to their father-land involves any sense of the grandeur of its scenes beyond the sanctity which the few events of their simple lives attach to the objects immediately associated with them. As far as I have been able to ascertain, a feeling of grandeur and beauty is not often expanded within them; though the semblances of it soon become affected when tourists teach them its value in the market for the romantic. However this may be, I believe the experience of most of those whose sensibilities are awakened by the presence of material greatness will concur with my own—that the first effect is that of wonder and depression; that the spirits sink among great mountain tops almost as if beneath a weight of care, and some shivering sense of oppression comes over us like that which I have imperfectly, and perhaps extravagantly, described as chilling me in the huge Alpine solitude among the heights above Airolo at the foot of the St. Gothard. This feeling of lovely sadness arises from the susceptibility of the mind to the impression of the regions around it, with a conscious want of powers adequate to spiritualize the gigantic images, and to make them its own; and it will continue so long as there is intellectual activity enough to desire a communion which there is not force enough to realize. He who is thus subjected to the forms of matter feels like a dwarf in the homes of giants, which he is told should be his home and his inheritance, but in which he discovers nothing for him but frowning tyranny. But to an active sensibility, the recurrence not only to the same scene, but to scenes on a scale of correspondent or kindred majesty, gradually overcomes the strangeness. "The divinity that stirs within us" asserts its relation to the huge shapes around us; old sensations of tranquil beauty cleave to the lower and lovelier features of the mighty scene, and the chilled waste becomes alured by the warmth of human affections. Not only do we learn to people the fastnesses of nature with "imaginary puissance," to feel in the huge breast of the mountain a sustaining power, to grasp on the verge of the black precipice a giddy joy, to recognise

the spirit of loveliness subduing mere bleak sublimity to its uses; but the sense of other moments of precious experience heightens the present, and makes us feel at home in the wildest solitude. It is not necessary to this reduplication of sentiment and delight that the mind should be conscious of the scenes which have enriched it; the silent spirit of other days is near us unseen, and sheds an interest at once strange and familiar on objects upon which for the first time we gaze. By this cause alone can I explain the home-felt charm which always spreads delight over the mind on the view of the distant ocean, serene in some tranquil light. The object itself—cold, desolate, vast, unbounded, restless, ever-changing—can offer no material repose congenial to the world-vexed spirit; and yet to me, at least, it is never stretched out in soft blue, or flecked by clouds, or quivering in moonlight, without imparting a sense of home. This feeling, which I believe is common, can only be accounted for by the many half-forgotten hours in which the same great object has been gazed on, while a thousand serious, though idle, musings (all traced in the immortal book of memory), have attached themselves to its expanse, and are ever faintly reflected from the lovely tranquillity of the ocean-field. I cannot therefore help thinking, that whatever may be the experience of the few who are endowed with insight into the mysteries of creation beyond their fellows, it is better for the mass (among whom, I rejoice to believe, the true love of external nature is largely diffused) to have that love first expanded and nurtured in youth among quiet scenes of English beauty; to trace back its throbbings to the time when the little schoolboy, on his hard pillow, has half remembered, half dreamed, of the fields and wood-walks he had carelessly paced in free childhood, and embracing them again with his holiday vision, has first felt that sweet faintness of the heart with which a recurrence to old scenes affects us; to embrace by the light of that love the grander scenes of its own land; and, after such cultivation in his own country, to enrich it with the mightier grandeur of Switzerland, or bathe the delighted spirit among the luxuries of Italy.—*Talfourd.*

"WHEN I was a little child," said a good old man, "my mother used to bid me kneel beside her, and place her hand upon my head while she prayed. Ere I was old enough to know her worth she died, and I was left too much to my own guidance. Like others, I was inclined to evil passions, but often felt myself checked, and, as it were, drawn back by a soft hand upon my head. When a young man, I travelled in foreign lands, and was exposed to many temptations; but when I would have yielded, that same hand was upon my head, and I was saved. I seemed to feel its pressure as in the days of my happy infancy; and sometimes there came with it a voice in my heart,—a voice that must be obeyed,—Oh do not this wickedness, my son, nor sin against thy God."

NATIONAL EDUCATION.

EDUCATION has become at last what it ought to have been long ago, the great object of anxious attention to philanthropists, divines, and statesmen. The legislator from his place in parliament proposes grants of the public money to advance this *pre-eminently public object*; the orator enlarges upon the fearful consequences of further delay in so important a matter; and the adherents of conflicting parties agree to let *this* question obtain the support of both Whigs and Conservatives.

Even the men who were formerly terrified at the idea of *general* education, and whose imaginations were filled with dark images of popular insubordination

at the sight of National schools, have come to admit, in a sort of whisper, that perhaps learning is not so very bad after all. To be sure they append to this concession the declaration, that people are not much better for all the fuss about their education, and that Joshua Stubbs is not a more able ploughman than his father, who thanked God that "he could never be hanged for forgery, whatever might happen." Nevertheless the yeomen are in many parts willing to support education of *some* kind; and the croaker of thirty years ago, who looked upon a servant able to write as unfitted to enter his doors, is now seldom found. We may therefore conclude, that most persons are in this age favourable to education; for the vast majority do in

some form contend for its extension to *all* classes of the community, however they may differ concerning its true objects and extent. But with all this apparent willingness to advance education, the *nation*,—the people as a whole—is uneducated to this hour. Of this assertion there can be no reasonable doubt; the feverish efforts of instructional societies prove it, and the experience of every public man demonstrates the same truth. Are we told by some well-meaning gentleman, who has just returned from a visit to a first class National school, that the knowledge possessed by the boys and girls is really wonderful? that chits, ten years old, know more than the man of seventy in former times? listen, benevolent gentleman, ere you sit down quietly to dinner;—listen to those sounds which rise with ominous distinctness from the crowded masses of the population, and behold the sights which in many a densely-peopled city suggest strange themes for the thoughts of the man who deems “all is well,” and speaks approvingly of the “march of intellect.” What say the chaplains of our jails,—whither seventy thousand English men and women are hurried every year,—respecting the education of those prisoners? *Not one half* can read so as to understand any ordinary book, and not more than one-tenth can read and write with tolerable ease.

Truly this does not look like enlightenment. Whence do these miserable men and women come? Chiefly from the lower ranks of society, the agricultural labourers and the inferior mechanics supplying by far the greater portion. Are the rest as ignorant as those? Probably not; for it is but reasonable to suppose, that the majority of those who fall under the powers of the penal laws have come from the very worst section of the people, and are consequently the most ignorant. But we are still compelled to believe that a vast portion of the lower order is without anything deserving the name of education, and this is the deliberate conviction of judges, magistrates, and the guardians of poor-law unions, who are most likely to know the real condition of the population. From their testimony it appears, that not more than *one person in twenty*, amongst the lower orders, receives an education likely to influence his character for good.

What means the system of “ragged schools” as they are called, and of which the public must have heard with few congratulatory feelings? Does it not plainly declare that in the festering centres of populous cities we have so allowed ignorance to accumulate its blighting powers, that all the existing modes of education are insufficient to draw from their dens the young letterless creatures, whose ignorance of things divine is equalled by their ignorance of things human. Within a few yards of some of these “ragged schools” are standing National and other places of education; but these buildings could not come to the children, nor would the wretched and depraved parents bring the children to the schools; and as the government, in its gracious condescension, refused to interfere, all went ripening on into crime, and perhaps preparing the elements for *revolution*. But it now seems that these outcasts can be drawn within the influence of an educational course, as the reports of these ragged schools sufficiently prove.

Why then have thousands been allowed to grow up from childhood to youth, in the most degrading ignorance, whilst statesmen have been legislating for places ten thousand miles distant, unconscious of the pestilence raging in the narrow lanes behind their stately residences? In the mean time millions of books have been translated and printed for the use of distant pagans, and schools are established by Englishmen in the South Sea islands; whilst, within the sound of the Westminster bells, multitudes have been growing up nearly as ignorant as those distant semi-barbarians, to whom our thousands and tens of thousands are sent.

What a glaring anomaly is here—what a fatuity is

this! Far be it from the writer to chill the ardour of generous enterprise for distant people; let such feelings burn with all the intensity of a holy sympathy for the woes of human-kind, but let not our own streets and alleys be left in darkness, whilst sending the means of knowledge to the antipodes.

Perhaps some may question the extent of the ignorance just described, and insinuate that the statement is overdrawn. The extent of such an evil must be judged by examinations conducted over the whole country, from which it appears that in every county and town a large portion of the population can only be described by the term *ignorant*; nor could any intelligent man employ another epithet. Ask all right-minded and zealous clergymen, in what state *they* find the mass of the poor: let the experience of some be evidence on this subject. One will tell of the strange discoveries made, when preparing the young for confirmation; what ignorance of the simplest facts of scripture history, what stupid blunders respecting the alphabet of Christianity, and what incapacity for the plainest moral arguments, are detected by the amazed examiner. Some will declare how St. Paul was confounded with Moses, by one youth; whilst Pontius Pilate is ranked with the prophets by another.

These *special* instances of ignorance do not often attract the reader's notice, for he is, perhaps, rarely brought into contact with the classes in which they abound. Let him not, however, deny the existence of evils because he has not seen them. That the mischief is here strongly stated is possible enough; that it might be expressed in milder terms may also be conceded; but on such small details of the argument time need not be wasted. Two men may vary in describing the gloom of a dark night—one calling it black, the other murky; but this will not make the darkness light, nor even change it to twilight. Neither can some diversities of statement destroy the assertion, that the “Education of the English is yet in a very low state.”

Even if we come to those who can perform something in reading, writing, and arithmetic, what do we find? Oftentimes the grossest ignorance exists, with the mere ability to “read, write, and sum;” which some persons really seem to regard as the three mystical operations, which must be all-sufficient to develop the understanding of him who can perform them. Nothing is more common, especially when speaking of the poor, than to reckon these three items as the total of education. A kindly-disposed person is examining the condition of the rustics in his parish, he enters a tolerably neat-looking cottage, and there sees a round-faced boy, fourteen or fifteen years old, who has just come from the neighbouring field to eat his dinner of bacon and bread. Young Hodge gives his front lock of hair a pluck upon the entrance of our observer, who is mightily pleased to see the school boy so well performed, nor less delighted at the sight of the bacon, which proves that S. G. O. will not collect much matter for the “Times,” should he wend his way hither.

But the visitor, being satisfied respecting the condition of the outer man, directs his attention not to the digestion, but to the intellects. The first question, “Can you read, my man?” is boldly answered with an “*ces Zur*, please,” and the assertion as boldly proved by reading a few lines in the newspaper of yesterday, which Mr. B— has carried in his pocket as a convenient test of rustic powers.

All was well done, save an unaccountable monotone in pronunciation, which almost suggests the possibility that the youth does not *understand* the lines he has just read. The second question, “And perhaps you can write too?” is also promptly answered, and attested by a full-length exhibition of the rustic's name in chalk on the back of the door. If, in addition to this, a “sum in addition,” or subtraction, can be disposed of, the chances are that Hodge gets a sixpence, and his benevolent examiner retires, filled with delight at the advance of the

present generation in knowledge and wisdom. We unhesitatingly assert, that thousands would be satisfied with *such* a state of education amongst the poor, and many are even startled at all proposals for a more comprehensive system. But "reading, writing, and arithmetic," are nothing more than the *means* of gaining knowledge, and should only be viewed as pre-requisites to education, rather than education itself.

They become to the mind what arms and legs are to the body,—the means of procuring exercise, and extending our acquaintance with distant scenes. We might as reasonably put a plane and saw into the hands of a man, and call him a carpenter, as to term reading, writing, and arithmetic, education. They are but tools of the mind, and, unless their proper use be inculcated, mischief is much more likely to result than good.

When a boy has acquired the power of reading with facility, *then* the care of the teacher begins,—*then* commences the process of *forming the character*, and so arming the young spirit with weapons offensive and defensive for the battle of life. Now, this important course is so much neglected, that it may be reasonably feared education, in its present too general state, is really *doing mischief*, and perhaps preparing hosts of readers for an infidel and ribald press, all the vulgar atrocities of which are believed by the poor man, whom we have taught to read, but not to think.

To libel all things, to falsify history, to teach vice under the form of sentiment, and to mingle with all this stirring addresses on the misery of the lower orders, are processes systematically carried out by certain periodicals. These are read principally by mechanics in the towns, and by small shop-keepers in country villages, whose notions are thus gradually drawn to the side of discontent and revolutionary tendencies. Yet the *mere* "reading, writing, and arithmetic" boy is just the subject desired by the compilers and editors of these unprincipled works, with whom our quarrel is that they are *hindering* not advancing the civilization of mankind. What must be thought of an editor who, in reply to some expostulations respecting the bad effects likely to arise from certain articles in his periodicals, could reply,—"*I am sorry for it, but what can I do? It brings in three thousand a year.*" What principles could be too hideous for such a man to promulgate, were he to see a chance of increasing his annual incomes thereby? Such guides would not be so blindly followed, were the *whole* people furnished with that *general* and elementary instruction necessary in all ages to form the citizen, but absolutely essential now to save the masses from anarchy, and the State from convulsion.

What is the great check to the circulation amongst the lower classes of that cheap literature which the enterprise of modern publishers has developed, but a defective education, preventing the people from enjoying the pleasures of knowledge, and excluding them from the world of just sentiment and pure taste in literature and art!

Publishers are devising fresh expedients to draw within their influence the bulk of the lower orders; magazines of a light character are sold at the lowest possible rate, weekly and monthly volumes on the most interesting subjects are issued at one-twentieth of the price at which such works would have been published twenty or thirty years ago. But what is the result? That the classes for which these great experiments were made still hang back, and stop not to taste the fountains opened with such vast labour for their health. The middle classes are the principal purchasers of these large editions of weekly and monthly volumes, which the philanthropist did once hope would have cast a renewing light into the cottage of the peasant, and the crowded haunts of Bethnal-green and Shoreditch. The bright dream is for the present over; the thick night of crime and error still looms heavily around, threatening at intervals the nation with some

destructive catastrophe. The patient listeners and watchers, who stand upon their lonely towers of observation, declare that often the muttering thunder is heard behind the gloom, and at times the flash lighting up for a moment the darkness, gives warning of danger at hand.

We know from what portions of the community violence is likely to come, should sudden events greatly disorganize the working of society, and therefore is it expedient that *something* effective be speedily done for the amelioration of existing evils, and the prevention of future mischiefs. The work must not be left to the scattered efforts of individuals, in which case one man may read the work of his neighbour; the whole nation should combine to *force* upon those in authority a general plan by which the ignorant parent shall not be allowed to perpetuate his own degradation, nor the caprices and crochets of unreflecting men permitted to stand in the way of a nation in its progress to civilization and knowledge. Let all public men scorn the despicable flattery which would persuade the people of this country that they form an enlightened nation; let the truth be proclaimed in parliament by senators, at assizes by judges and grand juries, and especially by all engaged in superintending education. And here we cannot refrain from addressing the examiners of National and other schools, whose reports must always have especial weight with the public. Are not the annual examinations of *many* schools purposely pitched at a low scale, from a consciousness that the children will not answer questions of a higher character? The examiner walks round the school on the appointed day, inspects the children's *hands*, their *dress*, and general appearance, ending with remarks on the importance of neatness, cleanliness, &c.

Not a word have we to say against all this mechanical part of the examination, which doubtless produces much good; though we cannot forget there is such a thing as "getting up" children for show. What is the examination itself? that is the chief question. Writing books are examined, lessons in spelling performed, and some rather "crack" sums worked. What else? Here comes the grand complaint,—the *understanding* of the scholars is not always examined, nor is the state of their moral and religious knowledge presented in a satisfactory form. We speak of the *majority* of schools; some there are specially favoured, from which better results are obtained; but are not these counted by units? Too few subjects are taught, and these are not intelligently explained to the pupils, so that even when the memory retains a fact the child does not understand it. Such results are sometimes traced to the abuse, some would say the *use*, of the monitorial system; and what indeed can be more fitted to produce stupid pupils, than placing a class of ignorant, volatile children under the tuition of one nearly as untaught as themselves. Certain lessons may certainly be got through; and we may doubtless carry an acute parrot to a surprising point in bird-knowledge: but, whether such teaching can open the understanding and discipline the mind of the hapless learner, is a question not difficult to answer.

In some schools, where a thoroughly competent master has a first class of superior boys under his care, much may be done by monitors wisely selected; but even then the *explanation*,—the *enforcement* on the intellect by varied illustration, the numerous forms in which one truth may be presented by a skilful teacher, and the quickening effect of judicious questions in developing the powers of the learner,—cannot be expected from monitors. Yet all this is *essential* to him who teaches another. We are well aware of the serious difficulties arising from the multitudes requiring education, and the small number of teachers. The *master* cannot do every thing; he must therefore rely upon the *monitors*, and it is not our object to advise the rejection of these auxiliaries *at present*, but to remove

public attention to the lamentable consequences flowing from the system in many cases. Whether some plan cannot be devised for *creating and preserving* a better monitorial scheme demands the attention of all,—but if no device seems possible, the nation must contribute more ample funds, and provide more *paid and trained* masters.

What a *general* scheme of education for the people should comprehend is not our province to decide; that it should be more *comprehensive* and more *exact* seems admitted by those most conversant with the subject; and we may be allowed to hope, that our programmes of education will not be henceforth limited to paper, but reduced to practice in every English school. The difference is startling between the subjects *professedly* taught to the masters and mistresses in the training seminaries, and the actual education brought from schools by the boys and girls of our populous towns and villages. To impart to the poor all those branches of knowledge which some enthusiasts desire may be hopeless, but let us not neglect the intellectual wants of the age because others suffer a too generous ardour to inflate their expectations. Enthusiasm on this subject will not deserve more than a prudent caution; but supineness may justly provoke the indignation and contempt of every man. Remissness in national education has been a national vice, and, unless succeeded by redoubled exertions, and those in the right direction, will entail ruinous consequences on some not distant generation. Other nations are in this respect leaving England behind, and disgraceful will it be to find the Prussian, Austrian, Swiss, and French peasants or artisans better educated than our boasted free-born Englishmen. We have held ourselves up to Europe as a moral and intelligent people, and puzzled Europe is compelled to admit much of this character to be true; but, in revenge, points to our drunken and ignorant artisans, who, when hired at high wages by foreign manufacturers, prove to be the most insolent, disorderly, and untaught of all mechanics. Nothing save the *special* manufacturing skill of our workmen induces the foreign employer to engage such ill-ordered men in his service. This is the testimony of foreign manufacturers in Switzerland, Italy, France, and other countries to which the mechanical skill of the English workman has conducted him, and where he disgraces his country by ignorance and vice. Let Britons arise and cure this crying evil by an improved system of national education.—W. D.

RAMBLES IN BELGIUM.

No. IV.—BRUSSELS.

BRUSSELS may not unaptly be called a miniature Paris; its shops, cafés, small park, boulevards, &c. contribute, in their several relations, to this *vraisemblance*. After leaving the railway station, the entrance to the city by night is very suggestive of the French capital. The Place Royale contains all the best hotels, and is, so to speak, the pinnacle of the new town, which has here a sort of natural separation from the old, inasmuch as a very long, tortuous, and hilly street must be traversed before the newer portions can be reached. The cathedral of St. Gudule first took my attention; it is a very large edifice with two enormous towers, the exterior effect heavy and ponderous. Not so the interior; for the columns are greatly relieved by the windows being filled with the richest painted glass. Several statues and monuments of various Dukes of Brabant are placed in different parts. The pulpit is, however, the great source of attraction: here, again, one is struck with wonder at the skill of the Flemish carvers in wood, so elaborately and exquisitely finished is this specimen in all its parts. It is supposed to have

been designed as a typical representation of the Christian faith. Below is Paradise, with the figures of Adam and Eve quitting the garden by the orders of the expelling angel; while high above may be seen the infant Saviour destroying the serpent. All this is so arranged as to leave a distinct impression on the mind as to the bearing of the whole work. The paintings are of no particular order of merit, and a so-called Rubens is a miserable affair. It was impossible to resist the pressing importunities of a flower-girl, who gave me, for two copper pieces, a delicious bouquet formed of roses and the sweet-smelling yellow jasmine. She had taken her station by the outer wall of the entrance, and would not be refused. It was curious to see the women carrying about large brass pitchers, looking very bright and clean, some full of milk, others of water.

The Flemish language sounded doubly inharmonious, when any of the peasantry, with their farming produce, passed by, as the shop-keepers speak very good French, and at the hotels the garçons, most of them, know English sufficiently well to answer any demand upon them. To be in Brussels a day without seeing its beautiful Hôtel de Ville was an impossibility; so, spite of the rain, which was falling in torrents, I descended the interminable Rue Montagne de la Cour, and soon arrived at the Grande Place, where it is situated. To my mind it is the most perfect of its kind in all Belgium, even exceeding the famous one at Louvain. It has a Gothic tower with a richly ornamental spire springing up to an immense height; there is a lightness and delicacy about it that made me often turn again and again to enjoy its architectural beauty. It was from hence that Charles the Fifth, weary of governing, resigned his throne, and, doffing the kingly garb, clothed himself in monkish habits, departing from one state of misery to another; his entrance in a monastery, and melancholy end, are too well known not to be associated with this old hall. Often, too, was it lit by the flames of the terrible Inquisition in the time of Philip the Second, and many scenes of historic interest were transacted in the adjoining neighbourhood. There is an excellent contrast afforded by the Maison Communale, which stands nearly opposite; it is a heavy, solid looking pile; it was rebuilt in the seventeenth century, and dedicated to Notre Dame de la Paix in consequence of the delivery of Brussels from the plague. There is an inscription upon it, though nearly illegible; I took it down, and found it to run thus: "A peste, fame, et bello, libera nos Maria pacis." It is now metamorphosed into shops.

Some very venerable-looking mansions covered with quaint designs, full of odd little windows, gables, and peaks, all attesting their Spanish origin, stand in this place and the adjoining streets. The theatre is in the Place de la Monnaie, and, after partaking of an elegant dinner at Du Bos Rue Fossé aux Loups, I attended the performance, which consisted of Meyerbeer's opera of the Huguenots, with no ballet or afterpiece of any kind. The admission to the pit was one franc and three-quarters. One thing seemed very objectionable, and that was, that all parts of the house had one common entrance; in case of fire, or any other emergency, the confusion and difficulty of exit must be terrible.

The pit was half full of soldiers, who are in this country encouraged by the State to acquire a love of music and other branches of the Fine Arts, by being allowed to enter their exhibitions and theatres at a certain consideration.

The opera was admirably acted and sung, the orchestra not too overpowering or noisy, and the chorus efficient, and alive to the interests of the situations,—not staring and gaping in one fixed line, but dispersed on the stage, and partaking in the emotions of the principal performers, of whom Laborde was the worthy chief: he has a lovely tenor voice of good and even quality; and both in that, and his impassioned way of using it, reminded me continually of Duprey. The bass part was

taken at a short notice by a tall gentleman, who was well received, and who did himself great credit by the style in which he gave Martin Luther's Hymn. Mademoiselle Heinfetter's Valentine was the crowning charm of the performance: simple and unaffected, with a rich clear voice never out of tune, she sang the music of the part most bewitchingly. The opera over, and the hour being only ten, there was every temptation to stroll once more to the Grande Place to see the effect of the moonlight on the Hôtel de Ville: it was like a piece of frosted silver, and one had a longing to place it under a glass case; it was too fragile-looking, too delicate, for open air exposure.

Before reaching the Hôtel de Flandre, it was impossible to pass the Café des Milles Colonnes without stopping to taste its far-famed coffee. It was found of excellent quality. The saloon is elegantly fitted up with a quantity of mirrors and gilt ornaments, and is abundantly supplied with French, English, and Belgic newspapers. There were several officers *en costume* playing at dominoes, and appearing to take as much interest in the game as if it had been whist or chess. Everything in the apartment was conducted in the most orderly manner.

On the following morning I visited the palace of the Prince of Orange: it is a well proportioned edifice, and has some very handsome floors of polished woods; the custode required all the visitors to wear list shoes over their boots, in order to avoid any injury to the flooring. As for the pictures which once adorned these rooms, they are gone to the Hague, having followed the prince after the revolution of 1830. It is made a matter of great favour to see the king's palace, and I could not by any means obtain access to it.

The Parc is small, and the trees are not in any way remarkable, except that many of the trunks are pierced by the bullets of the conflicting parties at the Revolution; it is very well kept, and with its statues and allées has a very pleasing and inviting aspect of a summer's morning, when it is generally the resort of the *bonnes* and their little charges, who seem to enjoy its refreshing shades. Occasionally too may be seen two or three ladies, without any bonnets, at needlework on the benches around. At the opposite end to the gate which leads from the Place Royale, there is a small theatre, in which chiefly light pieces are played. There are several public fountains in the city; one is stated to have been erected by an ancestor of the present Marquis of Aylesbury; another, called *le Cracheur*, is not at all remarkable for the taste it displays, and the *Manikin* seems to be a favourite with the townsfolk, who have some legend connected with it, and have set apart a day in July as a fête for its honour, or rather I suspect for their own gratification and amusement. Very near the Parc, and opposite to the side where the palaces are situate, stands the Palais de la Nation: it is a handsome edifice in the Grecian order of architecture. Admittance was readily accorded to me and a party of French tourists, whose contemptuous observations on the arrangements of the interior were really most amusing. The chamber of the Lower House is a half circular apartment. On one side is a platform on which is placed the President's chair, before whom the orator for the time being advances from the body of the house, and addresses the assembly. Several rows of benches face this tribune; they are conveniently fitted up with desks and places for writing materials. The light is admitted from above, and, though far inferior in point of effect to the British House of Commons, yet there is a quiet air of dignity about the spot not unworthy its real intention and use. In a room, apparently set aside from some more exalted position, we were shown two large paintings: one a representation of the Battle of Waterloo, in which the present King of the Netherlands and the Duke of Richmond are vividly portrayed. Like all pictures of this class, in which red coats and smoke form a promi-

nent feature, the impression left on the mind is of no agreeable character.

Anxious to have another opportunity of seeing some of the flowers and plants for which Belgium is celebrated, I hurried over my inspection of the Representative Upper House, and sought out the Botanic Garden; it is very near the railway station and on the slope of a hill. The grounds are of no great extent, but are laid out in a diversified and tasteful way. The conservatory is large and handsome, and contains some tolerably good palms, but on the whole was disappointing for one who had expected more.

Walking home through the Rue Montagne de la Cour, I was astonished to notice the number of confectioners' shops. They are famous for a cake made of almonds, altogether different to our own, both richer and more appetizing. Chocolate is sold in all sorts of devices, and is eaten as a great delicacy by the middling classes. A troop of infantry were marching up the steep street, and gave a very fair sample of "*les braves Belges*." By far the greater number were under the ordinary height of English foot soldiers, and gave one very much the idea of a yeomanry corps in the midland districts. They did not seem as if they were accustomed to bear arms, and at times evinced an awkwardness truly absurd. The officers were fierce looking gentlemen with terrible mustachios, and thickly padded coats.

The sensation produced by this military array was very slight, as compared with a similar march of our own well appointed men on a summer afternoon up the shady side of Pall Mall. Education and refinement seem to have advanced more amongst them than they have in our troops, for, on quitting the street to take a peep at the works of art that were being shown at the Exposition Nationale, I was a listener to some very able remarks on one of the statuettes, made by two common soldiers, who were criticising the design with an evident perception and love of the beautiful. A similar reflection suggested itself on the previous evening at the theatre, where a man sitting near me in the plainest uniform, entered into conversation with his neighbour, and spoke of Rossini's and Mozart's music as a thing perfectly familiar to him. His observations on Meyerbeer and the dramatic music of France were excellent; no amateur or critic could have displayed more taste or intelligence.

The Exposition displayed some fine paintings; one group of wild animals by the Belgian Landseer were especially clever. Verboekhoven is an artist of great merit; I had seen some of his works in London, but was not prepared for anything so good as the execution of this painting. There was a force of contrast, a power, and finish, which bespoke a mind of high order.

A very fanciful marble statue of Hope claimed a good deal of attention, which I was glad to see bestowed upon it by many around.

Although much pleased with the entire exhibition, I came away still more gratified with the thought that the remembrance of my own talented countrymen was not in the smallest degree weakened or effaced.

Coming out, there was a number of young girls dressed in white, with a wreath of white roses round their heads, standing, talking together in subdued tones. Their costume requiring some explanation, I was told they had been to their church to be confirmed by the bishop. They did not speak much for the beauty of their race, for one and all were as plain daughters of Eve as ever existed.

An introduction to the proprietor of one of the largest lace manufactories gave a pleasant means of inspecting his establishment; nothing could be more courteous or more attentive than this gentleman, and he was at considerable pains to point out anything that questions were asked upon.

It was wonderful to hold some of this delicate fabric in the hand, and examine the minuteness of the pattern, and it was difficult to believe that the large coarse

fingers of the workwomen could have brought this art to such perfection. Wonder followed wonder, as I thought on the fields of flax I had passed, and remembered that they were the origin, or rather foundation, of these fairy-like articles. The manufactory was very dark, and not well ventilated, so that a ramble on the Waterloo boulevards was quite necessary, before assisting at the four o'clock *table d'hôte*, at the *Hôtel de Flandre*. Of this latter, it is necessary to say special words of commendation and recommendation. Be assured, oh reader, that it is first and foremost of all hotels in Brussels. The dinners are superb, and served in the best style; it is the custom to have the dishes placed before the admiring eyes of the guests for a few minutes; they are then carried off by the attendant *garçons* to a sideboard, cut up, and handed to each individual; the *pâtisseries* is of the most varied kind, and must be, not seen, but tasted, to be appreciated. The society is always, as I have heard and found, good, and parties, who have never met before, mingle cordially in the conversation of the dinner table. Brussels is a charming place for a short *séjour*: retirement or gaiety may be equally enjoyed, and it is an easy distance from London on the one hand, and Paris and the principal German towns on the other. It is a mistake to suppose that it is a cheap spot to live in; the prices demanded by the shopkeepers are fully as high as those of the first houses in the west end of town, and it needs some acquaintance with the different localities to find out good and respectable, and, at the same time, moderate houses, where the necessities of life may be purchased.

The general temperature of the city is equable, and the many *agrémens* connected with it render it a very agreeable resort for the invalid, who seeks to combine amusement with a relaxation from all active duties.

ON THE ORIGIN AND NATURE OF PRAIRIES.

Few of our readers can be unacquainted with the fact, that a vast portion of North America is occupied by level plains of extraordinary extent, called *savannahs*, or prairies. These prairies are of three kinds: first, the heathy or bushy prairies, which have springs of water, and are covered with small shrubs, grapevines, &c. These are very common in Indiana, Illinois, and Missouri. Second, the dry or rolling prairies, generally destitute of water, and almost of all vegetation but grass. These are the most common and extensive: the traveller may wander for days in these vast and nearly level plains, without wood or water, and see no object rising above the horizon. Third, there are the alluvial, or wet prairies, which form the smallest division. These are covered with a rich vegetation of tall rank grass. The soil is deep, black, friable, and fertile, and abounding in pools without issue, left by the floodings of the rainy season.

There is this peculiarity in the scenery of North America, that forest and pasture land are seldom found intermixed. The country consists either of vast tracts of land, such as above described, and altogether destitute of timber; or it is covered with forests for many hundreds of miles. This remarkable difference between the features of American scenery, and all that we, as Europeans, are acquainted with, has led to various theories by which the circumstance is attempted to be explained. Decandolle states, that the right of prior occupation is sufficient to explain the fact;—that forests and prairies mutually exclude each other. He considers, that if by any cause a forest is established in a given place, the shade of the trees, and the eagerness with which their roots absorb nourishment, together with the interlacings of these roots, will prevent the

grasses from shooting up underneath. If, on the contrary, the prairie is first developed, then, supposing that the seeds of the trees do from time to time germinate, yet their young roots cannot easily pierce the close network of the grasses already existing on the spot, and, even if they do, they are starved by the voracity of the grass-roots, which are more numerous, and better developed than their own.

Not resting satisfied with this attempted solution, Dr. Daubeney, in his *Lectures on Agriculture*, inquires what has given to the forest in the one case, and to the meadow in the other, that prior occupancy, to which their power of maintaining entire possession of an extensive tract may perhaps justly be attributed.

The view of the subject, taken by the learned professor himself, appears so likely to present the real cause of the phenomenon in question, and his remarks on the exuberance of newly-peopled countries in general, are so interesting, that we make an abstract of them for the benefit of our readers.

It is probable, that in the climate and latitude alluded to, forests would usurp dominion over the greater portion of the country, if no extraneous cause interfered to arrest them. It is only necessary, therefore, to explain why large tracts should be found wholly denuded of timber; and this it seems most reasonable to attribute to the practice that prevails amongst the Aborigines, of annually setting fire during summer to the plains, in order the more readily to take deer and other wild game.

In the dry season a fire, when once kindled, spreads in all directions, until it is stopped by the intervention of a river, or by meeting with a ridge or tract so destitute of vegetation as to afford no combustible materials. Hence those vast plains that lie to the west of the Mississippi, not being intersected by any barren range of hills, nor yet traversed by large rivers, have in the course of years been converted into prairies, the growth of timber being from time to time prevented by the cause assigned, until the luxuriant herbage at length so pre-occupies the soil, as itself to stifle all other kind of vegetation; whereas, over a wide tract extending along either side of that great stream, the numerous tributaries that pour their waters into it, oppose a limit to the progress of such fires as may occur, and thus enable the forests to maintain their ascendancy.

Be this as it may, the absence of timber in the prairie country is by no means an evidence of sterility: on the contrary, the immense accumulation of decayed vegetable matter, which has resulted from the growth of herbaceous plants during so many centuries, is found to constitute a soil of almost unrivalled productiveness.

The colonist, therefore, in settling down in such a region, has little room for the exertion of any extraordinary skill or industry, having around him an unlimited extent of land, which in its actual condition affords the richest pasturage, and which, whenever he takes the trouble of turning it up and scattering seed over it, will generally repay him largely for the labour expended. Harder, indeed, is the lot of him who takes up his abode within the precincts of the primeval forests of the western world; since, before he can reap any advantage from the land he calls his own, he must undertake the severe task of clearing it of the timber with which it is encumbered. This, however, being accomplished, it is seldom that he is disappointed of an ample return for his labour. Notwithstanding his rude and imperfect method of culture, his success is as great as that which follows the utmost exertion of skill and experience in older countries. This was even the case in parts of the Union which are by no means remarkable for their fertility at present; as, for instance, in the state of New England.

"When the tract on the green mountains in Massachusetts was first settled," says Dr. Dwight, "the same exuberant fertility was attributed to it, which has since

characterized Kentucky. From those regions the paradise has travelled to the western parts of the state of New York, to New Connecticut, to Upper Canada, to the countries on the Ohio, to the south-western territory; and is now making its progress over the Mississippi into the newly-purchased region of Louisiana. In consequence of the long accumulation of vegetable mould, regions, even if naturally sterile, hold out at first the promise of an abundant return to the cultivator."

There is little reason to doubt, therefore, that the first Egyptian and Phœnician settlers in Greece, or the first Greeks who peopled the shores of Italy or of Spain, would find themselves in circumstances as favourable to husbandry, as the present emigrants in the far west. It would seem, indeed, that the extraordinary exuberance of newly-peopled countries, where the subsoil and climate allow of the spontaneous growth of timber, may have given countenance to some of those visions respecting the Golden Age, in which the teeming imaginations of the inhabitants of early Greece delighted to indulge. But, in the case of colonists, both ancient and modern, a period must at length arrive, when the soil, exhausted by unintermitted tillage, would cease to yield him a profitable return; in which case, so long as abundance of good land remained unoccupied, the most obvious course would be to abandon his present possessions, and to advance further into the vacant territory, until he lighted upon some tract better suited to his purpose.

This, accordingly, is often the practice in the United States, not only in the newly settled countries, but in the older states of Georgia and the Carolinas, where the cultivation of cotton, though profitable at first, soon exhausts the soil, and reduces it to sterility; so that estates, which once yielded an abundant return, are abandoned by their possessor, and become again a portion of the original wilderness. This is the only plan which presents itself to the settler in a new country, for restoring to the earth that fertility of which it has been deprived.

This is, in fact, a substitute for the method of fallowing, which constitutes the first step in an artificial system of culture; and it seems probable, that the early colonists in the Old World may have been led to introduce the latter practice, by observing the unfruitful soil, when abandoned to itself, gradually resuming its former productiveness. For although, for a certain period, they may have wandered from one territory to another, as the settlers in America now do, yet there must have been a limit to this unrestrained emigration: hostile tribes, in many cases, hemmed them in, and natural obstacles frequently prevented them from moving to a great distance.

Thus, being more generally confined to one spot, the colonists of old would be the sooner driven to adopt the system of fallowing, in order to restore to their land the fertility of which their mode of culture had deprived it. Accordingly we find, in the Hebrew law, every seventh year set apart as a period of entire rest—a command, it is to be observed, grounded not only on religious, but on political considerations; with the view, that is, of preventing the soil from being worn out by continual tillage. The practice of giving entire rest to the land at certain intervals, enjoined under the Mosaic dispensation as a religious duty, was also adopted in the early times of Greece and Rome.

A vivid idea of the nature of a prairie is conveyed by Catlin in the following passage:—

"Every rod of our way was over a continuous prairie, with a verdant green turf of wild grass, of six or eight inches in height; and most of the way enamelled with wild flowers, and filled with a profusion of strawberries.

"For two or three of the first days, the scenery was monotonous, and became exceedingly painful, from the fact that we were (to use a phrase of the country) 'out of sight of land,' i.e. out of sight of anything rising

above the horizon, which was a perfect straight line around us, like that of the blue and boundless ocean. The pedestrian, amid such a discouraging sea of green, without a landmark before or behind him, without a beacon to lead him on, or define his progress, feels weak and overcome when night falls; and he stretches his exhausted limbs, apparently on the same spot where he has slept the night before—with the same prospect before and behind him, the same canopy over his head, and the same cheerless sea of green to start upon in the morning. It is difficult to describe the simple beauty and serenity of these scenes of solitude, or the feelings of feeble man, whose limbs are toiling to carry him through them, without a hill or tree to mark his progress, and convince him that he is not, like a squirrel in his cage, after all his toils, standing still. One commences on peregrinations like these with a light heart and a nimble foot, and spirits as buoyant as the very air that floats along by the side of him; but his spirit soon tires, and he lags on the way, that is rendered more tedious and intolerable by the tantalizing mirage, that opens before him beautiful lakes, and lawns, and copses; or by the looming of the prairie ahead of him, that seems to rise in a parapet, and decked with its varied flowers, phantom-like, flies and moves along before him."

HANNAH LAWRENCE.

A COUNTRY STORY:

BY ELIZABETH YOUATT.

"Come linger in our garden bower
A little while with me,
As closes the gum-ristus flower,
And homeward flies the bee.
I have a true and tale to tell,
And you shall pause, and listen well."

AND now, gentle reader, we will tell you a country story;—one that actually took place far away, among green fields, and quiet woodlands, where it is related by the aged to this day, with a simple and solemn truthfulness at which you cannot choose but weep, although you will presently smile, and bless God, as they never fail to do when they tell it.

Once upon a time, (we love to commence thus, in memory of our happy childhood, whose pleasant tales always began after this fashion)—Once upon a time there lived a young girl named Hannah Lawrence. She was an only child, and as good and sweet tempered as she was pretty. A little wilful to be sure,—it is said, most women are; but then, as her old father used to observe, she had such a winning way with her, that one could not help loving her, do what she would. There was another beside Mr. Lawrence, who was much of the same opinion; and Hannah felt it, and was happier than she cared to let the world know of; while the knowledge, so far from tempting her to exercise the power she was conscious of possessing, made her humble, and meek-spirited. To be sure, she did contrive in general to get her own way, but it was so quietly that her lover yielded almost imperceptibly to her gentle guidance. The woman who loves, and is beloved, should feel her own responsibility, and be careful to blend the wisdom of the serpent with the harmlessness of the dove.

When Robert Conway told his mother that he believed smoking did not agree with him, and that he should give it up,—that he was weary of the debating club, which only led to drinking and quarrelling, and thought his evenings would be much better spent at home,—she agreed, with a quiet smile, and blessed Hannah Lawrence in her heart. The aged woman was fondly attached to her intended daughter-in-law, and

had sufficient good sense to be pleased rather than jealous of the influence which she possessed over Robert.

"So you do not like smoking?" said Mrs. Conway; ceasing at the same time a mischievous glance towards Hannah, who at that moment entered. "Do you hear that, Hannah?"

"Yes, mother," replied she very demurely, "and I cannot say that I am altogether sorry, for it certainly does make the breath smell very unpleasantly sometimes."

"But my breath does not smell now, Hannah, dear!" said Robert, kissing her. And, as the girl looked up into his frank open countenance, she longed to whisper—that smoke, or do what he would, she did not believe that there was his equal in the whole world. It was as well, perhaps, that she did not: it will not do to humour ones lover too much. It is different with a husband.

Hannah sat between them, with a hand in each; she was very happy.

"Why should it not be always thus?" whispered Robert Conway. The girl looked timidly at his mother.

"Answer him, Hannah," said she. "I also am impatient to have two children instead of one." But still she never spoke a word.

Mrs. Conway had been young herself, and she rose up to leave them together; but Hannah would not suffer her.

"Do not go, mother," said she, timidly.

"What is it you fear?" asked her lover, drawing her gently towards him.

"Only—only that this should be all a dream!" And she rested her head upon his bosom, and wept.

Robert Conway smiled as he soothed and kissed away her tears. As Hannah said even then, it was too great happiness to last.

That night she told her father and mother everything, with many blushes and a few tears, for she felt home-sick at the thought of leaving it for ever, although it was to live close by; however, the day was at length fixed for her marriage. And the old people blessed her again with joyful hearts, together with the lover of her youthful choice.

"Yes, he is worthy even of our Hannah!" said Mrs. Lawrence.

"Worthy! O, mother, he is too good for me!"

"Impossible!" replied the old man, "even if he were the king himself."

"Robert will not spoil me as you do," said the girl, stroking down the father's long white hair with playful fondness.

"I am not so sure of that, or how he will be able to help it."

Hannah laughed, but there were tears in her eyes as she bent down to kiss his withered brow. The conversation now turned upon the many things that were to be done and arranged before the wedding could take place. Hannah wished to have her young cousin Maude Hetherington sent for, who, with her ready invention, and nimble fingers, proved a great acquisition on the occasion. Besides which it was very pleasant for the girls to talk together in their leisure moments, or when they went to bed at night; and often until morning dawned; for Maude likewise expected to be married before another twelvemonth, and they had a thousand things to say to one another. Maude was older than her cousin, and sometimes took upon herself to play the mistress.

"Do you not humour Robert Conway almost too much?" said she one day.

"Oh! not half enough! If you did but know how kind, and good, and thoughtful he is!"

"Yes, just now; but take care, or by-and-bye he will be playing the husband and the tyrant."

"Are all husbands tyrants?" asked Hannah, archly.

"Well, I do not know about that; but it will not

do to let them have their own way too much beforehand."

"But I cannot help letting Robert have his own way, because, somehow, his way is always mine. We certainly do think strangely alike about everything."

"Not strangely," said Maude, with a smile. "And so you have really consented to old Mrs. Conway's living in the same house?"

"It was my own suggestion. Robert is greatly attached to his mother; and so am I too, for the matter of that. The dear old lady seemed quite beside herself with joy when she heard that she was not to quit the home of her childhood, where she had seen so many pleasant days, and will again, please God; and blessed and thanked me, with the tears in her eyes; while Robert stood by, looking as happy as a prince. Dear Robert! he is so easily pleased, so easily made happy!"

"Well, I only hope you may never have cause to be sorry for what you have done. For my own part, I would not live with a mother-in-law for all the world!"

"But mothers-in-law are not always alike, Maude, dear!"

"True; and to be sure Mrs. Conway is very kind and good natured; only a little too grave to be a fit companion for a young girl like you."

"But I mean to become grave too, when I am married," answered Hannah; with a smile.

About a week before the period fixed upon for the wedding to take place, Hannah complained of a sudden faintness, and looked so pale, that her mother and cousin were quite frightened.

"Nay, it is nothing," said she, "but do not tell Robert, lest he should be uneasy about me."

Maude supported her to her chamber, and persuaded her to lie down on the bed for a few hours, after which she got better again; so that, by the time her lover came in the evening, all traces of her recent indisposition had entirely vanished. But she grew sad after he was gone, and observed to her cousin, that she feared she had not deserved such happiness.

"I thought so this morning," said Hannah, "when I was taken ill. Oh! Maude, if I were to die, what would become of Robert? We love one another so much!"

"Hush!" replied Maude, "I will not have you talk thus. God grant that there may be many years of happiness in store for my dearest cousin!"

"Forgive me," whispered Hannah, "I am very silly."

"To be sure you are," said Maude, kissing her affectionately.

Every stitch in Hannah's simple wardrobe, even to her pretty white bridal dress, was of her own setting. Many said what an industrious little wife she would make; and there were not a few who envied Robert his good fortune, and could have wished themselves exactly in his place, although the girl herself would not have changed to have been made a queen. All the cakes, too, were of her making, assisted by Maude, and her old mother, who could not however do very much; and it was cheerful enough to hear them talking and singing over their pleasant tasks. As Maude said, "What was the use of being dull for her part she could never see anything in a wedding to make one weep, unless, indeed, the bridegroom should be old or disagreeable, or going to take her away from all her kindred and friends; and even then she would not marry, unless she could love him well enough to go cheerfully."

"As for you, my dear cousin," added she, "about to be united to such a man as Robert Conway; with a sweet little cottage close by, so that you may see your father and mother every day, if you like—why I could almost envy you, if it were not for certain anticipations of a similar happiness in store for myself. Ah! you shall come to my wedding by-and-bye, and see how merry we will be!"

"And help to make these nice cakes, eh, Maude?" said Mrs. Lawrence, laughingly. "But you are nothing

pale, my child," added she, turning to her daughter, "and we must not have you tire yourself. There is another whole day yet."

Hannah smiled, or rather tried to smile; and, tottering as she walked, went and sat down by the door as though she felt faint.

"Are you not well, cousin?" asked Maude.

The girl's lips moved fast, as they grew every moment more white and colourless, but no sound came.

"It is only a fainting fit," said Maude, endeavouring to appear calm. "You had better bathe her temples with a little cold water, while I run for Mrs. Conway. I will not be gone a moment, and she may advise us what to do."

She soon returned, followed at a distance by the feeble steps of her aged companion. Rendered utterly helpless by grief and terror, Mrs. Lawrence could only wail and wring her hands like a distracted thing, calling in passionate accents upon the name of her child; while Mrs. Conway, whose presence of mind never forsook her, directed Maude to send immediately for the doctor, applying in the mean time all the restoratives usual on such occasions; but her care was vain. Between them those aged women bore the stricken girl in their arms, and laid her on the bed, where she remained white and motionless, as though carved out of stone. Seeing that there was no more to be done, Mrs. Conway knelt down and prayed as we only pray at such times as these.

Maude returned with the doctor, and they tried to bleed her, without success. All their attempts to restore animation were in vain; the girl never spoke again, but died towards morning peacefully and without a struggle. Once only she opened her eyes, and looked around her with a wild agonizing glance that was never forgotten by those who witnessed it. Mrs. Conway closed them softly and shudderingly with her hand, and she never moved after that.

Pale and horror-stricken, Robert made one of the little group who stood weeping in their vain grief around the bed of death. And, when his mother rose at length from her knees, and laying her hand upon his shoulder, said in a solemn voice, half choked by tears,—*"The Lord has given, and the Lord has taken away; blessed be the name of the Lord!"* his heart refused to utter, Amen!

Maude's grief was deep and passionate, but nothing in comparison to the wild lamentations of the bereaved parents: until at length, completely worn out, they both fell asleep by the bedside of their dead child, and dreamt that the wedding day was come. Mrs. Conway had taken her son home, thinking he would be more likely to recover his composure, away from that terrible scene; and poor Maude crept about the house, putting out of sight all the simple bridal finery, over which they had taken so much pains only the day before. "As for the cakes," thought she, "they must do for the funeral." And she began to weep afresh as she recalled to mind all the pleasant words and merry jests that had been uttered over them; almost the last words that Hannah was ever heard to speak being in playful anticipation of an event that was not to be. Of a truth it was very terrible! No wonder that poor Maude felt heart-stricken, and like one in a frightful dream. No wonder that she sobbed and cried, when even a strong man, like Robert Conway wept. Every moment that Mrs. Conway could spare from the side of her half-distracted son, was spent at the cottage, where she assisted Maude in performing those and, but necessary offices, of which the poor old mother, in her deep affliction, seemed utterly incapable;—speaking words of comfort and consolation, and endeavouring to improve this melancholy event to the heart of her young companion, by teaching her the futility of all earthly hopes.

Two days and nights had elapsed since the spirit of the young and beautiful betrothed had passed away without a word, or a prayer; and the two sorrowful

mothers sat together in the dim twilight, exchanging now and then a few kind words, but more frequently remaining silent for long intervals, during which memory was no doubt busy enough. Maude was a little apart by the half-open casement, working on a black gown for Mrs. Lawrence to wear at her child's funeral, and pausing every now and then, to wipe away the blinding tears that hindered her from seeing what she was about; and thinking the while, perhaps, of a certain dress, over which she had taken so much pains for a far different occasion.

"It is too dark, I am sure, for you to see to work, Maude," said Mrs. Conway, at length; and her voice sounded strangely loud in that silent room. "Go into the field, dear child, and look for your uncle; it is late for him to be out alone."

The girl did as she was desired, and found him kneeling amid the long grass, with his white hairs uncovered, and the tears streaming down his withered cheeks. Not liking to intrude upon his grief, Maude stepped behind a large tree and waited, hoping that he would presently rise up of his own accord, and return home.

Meanwhile it grew quite dark, and so still that the inmates of that desolate cottage could almost hear the beating of their own hearts. Mrs. Conway arose at length to procure a light, and just at that moment a faint, moaning sound was heard, proceeding, as it seemed, from the bed where the corpse lay. Mrs. Lawrence clung fearfully to the side of her companion.

"Did you not hear something groaning?" whispered she.

"Yes, I thought so; but it might have been only the wind."

"Hush! There it is again!"

"Let me go!" exclaimed Mrs. Conway, hastily disengaging herself from the terrified grasp of her companion. "It is Hannah's voice!" And tearing aside the curtain from the foot of the bed, there was Hannah, sure enough, sitting upright in the dim moonlight, and looking wildly around her, like one awakened from a heavy sleep.

With ready presence of mind, Mrs. Conway threw a large shawl over the dead-clothes in which she was wrapped, and spoke to her calmly and soothingly, motioning to the mother, at the same time, to go out quietly and call for assistance; but Mrs. Lawrence stood still and motionless, as though her feet were glued to the floor.

"How cold it is!" murmured Hannah, shuddering as she spoke. "But what is the matter? Have I been very ill, mother?"

"Yes, yes; but keep quiet, dear child, you will be better soon!" And freeing her face, she laid her head gently back on the pillow, and went as fast as her tottering steps would carry her to summon medical assistance, and prepare Maude and Mr. Conway for what had happened, leaving the mother, still motionless and terror-stricken, in the darkness.

By the aid of heat, and restoratives constantly applied, Hannah soon began to rally, and by the morning was almost well, but for the weakness and exhaustion, and a strange feeling of weariness, beneath the influence of which she at length fell into a gentle slumber. How anxiously did they all listen to her calm regular breathing, and gaze upon that sweet face, once more coloured with the warm hue of life. How they longed to be able to get off the grave-clothes without her knowing it, fearing that the shock would be too great, but could not without disturbing her, which the doctor had strictly forbidden. How they wept, and prayed, and blessed God!

Presently Hannah opened her eyes, and fixing them upon the anxious faces that were watching over her, inquired of her mother if she had been long ill.

"No, my child, not very."

"Ah! I remember now—I was taken ill while we

were making the cakes; but it is only a fainting fit. By the bye, Maude," added she, as the girl came forward, and bent down to kiss her, "I hope you looked after them, for the dough was just rising, and they promised to be excellent."

Her cousin tried in vain to keep down her struggling gobs, and answer calmly; while Hannah, mistaking the cause of her emotion, added kindly,

"Well, never mind, dearest! We can easily make more; it was my fault for frightening you.—And mother, do not say a word to Robert, please, about my being ill; it is past now."

"You must not get up, Hannah; indeed you are not strong enough," exclaimed Mrs. Conway, trembling lest she should discover all.

"Oh, yes, I am so much better; and Maude and I have a thousand things to do. It was only the heat made me feel faint. But how came I by this shawl?" asked Hannah, as she endeavoured to unfasten it from about her shoulders. "It is Mrs. Conways!—Has she been here?"

"She is here now," replied the kind voice of her old friend, while a tear fell upon her uplifted brow; "but you must lie still, my child, and listen to what I am going to tell you."

"Please don't let it be a very long story, mother dear," said Hannah, as she flung her arms around her, and laid her head upon her bosom, like a playful and weary child.

Who shall attempt to describe her feelings when she heard all? feelings expressed rather by tears than words. Mrs. Conway understood them best, when she motioned to the rest that they should kneel down and pray for her, that she might never forget that solemn hour in which God had restored her to them, as it were from the dead.

Robert Conway was half beside himself when he heard the joyful news; and could not rest until he had gone in softly, and kissed her hand, as she lay pale and tranquil upon the bed: for, somehow, he dared not touch her lips, although she was his own betrothed bride. After that, many of the neighbours came just to look upon her, and congratulate the old people on the restoration of their child. But none spoke above their breath, for fear of disturbing her.

In a few days, Hannah rose up, and went about among them all just as usual, only that she was paler and graver; but no one wondered at that. The wedding did not take place until some time afterwards; when Robert received his young bride as the gift of God; and truly she brought a blessing with her. Hannah lived many years, and was a happy wife and mother, and what is better still, a happy Christian; meekly trusting in the merits of her Redeemer, and ready whenever it shall please God to call her to Himself.

There are many instances on record, somewhat similar to the above; but not all ending so happily. It was only a few days since we heard of a poor woman, living in an obscure country place, who suddenly became insensible, and was supposed dead. On the night previous to the interment, her sister, who occupied the next chamber, was disturbed by a slight noise, and looking in, saw the corpse sitting erect, and attempting, as it seemed, to remove the grave clothes from about its face. The terrified woman caught up her sleeping child from its cradle, and fled away, half naked as she was, to the house of a neighbour nearly a mile off; where she remained all night, although they only laughed at her, and fancied she must have been dreaming. The following morning, however, the appearance of the corpse fully corroborated her statement; giving fearful evidence of the struggle that had been going on between life and death. The poor woman might have been alive to this very day, had her sister only possessed presence of mind enough to assist instead of deserting her in that dark hour of untold agony. And yet we are ready to make every allowance in a case where none of

us can be quite certain that we should have had the courage to act differently.

The story of the sexton and the ring must be familiar to most of our readers; and we could tell them many others equally wild and wonderful—melancholy histories, for the most part, but not without their warning lesson both to the aged and the young.

THE DISCOVERY OF THE STEAM-ENGINE.

If some of the greatest philosophers of antiquity, or of the middle ages, could re-appear and reside for a year amongst Europeans, travelling through England, France, and Belgium, they would perhaps see many of their own brilliant guesses and profound musings expanded into the sciences of modern times. Pythagoras might see his theory of the universe taught in every school, and illustrated in popular treatises; and Roger Bacon behold his anticipations verified in the beautiful discoveries of modern chemistry. They often saw in dim outline, and amid the glimmering of twilight, the truths which we calmly contemplate by the light of a bright noon: thus in some departments our knowledge differs from that of former ages in *degree* rather than in kind; they had mounted one or two steps upwards, we have advanced a hundred.

But some of our discoveries are *wholly modern*, and never once, as far as we know, entered the minds of the ancient poets or sages. The steam-engine is one of these conquests of the world's old age, which its younger, that is, its *past* periods, did not even register as a "*may be so*," or a *possibility*; simply because the thing never entered their thoughts, never once projected its form along the horizon. Had it been proposed by some oracle or superior being as a problem to such men as Aristotle and Archimedes, they *might* have admitted the idea, but as a guess or speculation, it never once appears. This may reasonably excite some surprise, as one essential element of the steam-engine must have frequently presented itself to their notice. We allude to the force exerted by steam, which must have been observed whenever boiling water was covered.

We should have expected that some of the subtle intellects, then struggling to obtain clear views of the phenomena around, would have stooped from speculating on the subtilities of metaphysics, to examine so simple a fact, and one so close at hand, as steam. But as thousands have seen apples fall from the bough without thinking of gravitation, so many generations looked upon steam forcing itself from the vessel, without asking the question, "Cannot that *power* be made subservient to man, to lighten his labours and add to his joys?" Hard work and toilsome struggles were then, as now, the lot of men. What an amount of strength, and even of life, were expended on the pyramids! what efforts on the great Roman roads!—much of which steam power would have saved; but this mighty agent was allowed to remain unemployed, whilst the world toiled on, digging, building, and hauling navies through the deep, by the hand. Yet, during these periods, academies,—old, middle, and new, had risen, disputed, and departed; thousands of books had been written, even in those ages, and ten thousand curious speculations on things visible and invisible hazarded; but no man saw the sleeping giant, which in future ages should stretch his arms from the Thames to the Chinese sea, and make his voice to be heard at the poles. Thus the elements of power are often in the world, close at its doors, but the world sees them not. It is not our purpose to describe the steam-engine itself; such details are perhaps too technical for the pages of a magazine; we rather desire to note the successive steps by which man reached the full knowledge of this world-moving power.

Reader, enter some store-yard,—on one side you see a heap of coals, near is a brook, and in a corner lies a quantity of iron; hast thou skill to shape that iron, new that water, and so arrange those coals, that from them a power shall arise able to carry thee and all thy townspeople round the globe in five weeks? You are not much startled at the question; you have not, it may be, such mechanical knowledge, but feel quite assured that it is in the world,—that some whom you could name possess the power. Let us then trace the road by which this discovery has been gained.

For fifteen hundred years after the commencement of our era, men saw not the energies hidden in steam, and a whole academy of philosophers might have walked into the store-yard, and gazed upon the coal, iron, and water, without a thought of the steam-engine. During this long interval, however, a glance was taken by one man at steam as a moving power; it was but a recognition, for the force was not yet pressed into man's service.

The philosopher who first detected the applicability of steam to promote machine movement was an Egyptian mathematician and mechanist (engineer we should call him), Hero of Alexandria, about two hundred years before Christ, who, in one of his treatises entitled "Pneumatic Machines," describes a circular motion given to a wheel by steam rushing through the spokes. This, though but a sort of mechanical toy, might have led others, even Hero himself, to dwell on the powers of steam, but his treatise remained unnoticed, and his experiment pointed in vain toward the road of further discovery. The schoolmen debated, the crusaders shook Europe and Asia, artillery filled statesmen and archers with forebodings, and a new world had been found beyond the Atlantic; yet, amidst all this work of busy nations, steam power remained a hidden thing. At length, a singular revelation is made in 1543, and exhibited before thousands, but finds the world unprepared, and retires to its hiding place. In that year the inhabitants of Barcelona were startled by the announcement that a Spanish captain, named Blasco de Garay, had offered to navigate a ship without sails or oars, and that the government had deemed the plan worthy of a trial in the harbour of the city. The day arrived, one in the bright month of June, well fitted to enable the Catalonians to see the new wonder cut the waters. Commissioners were appointed to watch the experiment, and report the results to the authorities. A vessel of two hundred tons burden, called the Trinity, was actually moved by steam, acting upon wheels, before the astonished city. Now the reader might expect that the management of steam power then began to excite the attention of men, especially of all who were aiming at the development of human resources. A strange disappointment is felt when we see the Spanish government rewarding Garay, and hear the majority of the commissioners report in favour of his invention, whilst no further results follow. What was the cause of this? Prejudice against the novelty, and ignorance of the machine,—for de Garay kept his plan a secret,—may have prevented success. All that was known was that he used a boiler, and that wheels were turned by its agency. Is it possible, some one may ask, that a Spanish captain should invent the steam-engine, and unaided advance it to such perfection that a ship was moved through the waters by its action; and that such a discovery should be neglected by so ambitious a power as Spain? These things are stated *as facts*, and must be received as true, however extraordinary. The machinery may have been clumsy, the working bad, and the power small, but that Blasco de Garay navigated a vessel by steam in 1543, cannot be reasonably denied. The experiment had little or no influence on the subsequent history of the steam-engine, and must be regarded as one of those bold movements which fall from unattainableness to the age or the nations in which made. The attention of Europe had, however, been aroused;

men began to feel that steam contained within it some element of mighty force, and thus the hitherto neglected power attracted the watching eyes of philosophers. During the next hundred years some notions appear indicating this altered feeling.

An engineer of Louis XIII. who became clerk of the works to the Prince of Wales in the time of James I. paid some attention to the subject; and an Italian mechanist, named Giovanni Bianca, proposed to turn mills by steam. Thus, at the beginning of the seventeenth century men seemed watching for the birth of the new power. Amid the fury of theological strife, and the rancour of political warfare, whilst England was distracted by civil commotions, and battles raged by sea and land; the element destined to unite distant nations, and form the world into one great household, was slowly rising from its concealment of many ages. We now approach the period when the notion of steam power assumed a clear and distinct form, and took its place among the reasonable speculations and experiments of thoughtful men.

Edward Somerset, Marquis of Worcester, had engaged with ardour on the side of the unfortunate Charles I. and found himself at last in the Tower of London, his friends dead or exiled, his property in other hands, and the cause for which he had fought and suffered trampled to the dust.

What now occupied the thoughts of the Royalist noble? Some have enlivened the solitude of a dungeon by watching the habits of a spider, or observing the growth of a flower in their prison window; he turned his active mind to the unexplored realms of science, and gazed inquiringly along those paths at the entrance of which Bacon had raised the clear sign-post, with the finger of true philosophy pointing the stranger in the direction which the world had so often groped for, and so often missed. To this imprisoned nobleman is ascribed the first well-digested idea of the steam-engine. How did the thought reach him? By what is commonly called an accident, or more properly by the happy observation of a simple and most common occurrence, and by just reasoning upon the fact noticed.

We must imagine the marquis seated in his small prison-room; on the fire is a pot, in which his dinner is preparing,—his thoughts are not upon the meal, but flitting to and fro, across the numerous battle-fields, where the Stuart banner had drooped, or picturing the solemn and mournful circumstances of that 30th of January, 1649, when a king died by the headman's hand. These reflections have, however, too often before occupied his mind, which is, therefore, easily drawn from such gloomy reminiscences to the events close at hand. What is that upon which Edward Somerset gazes so fixedly? That fire is not the alchemist's furnace, nor that pot a Rosicrucian crucible, and yet his eyes refuse to move therefrom. Nought is visible, save the hissing steam rushing from the pot, and the sharp risings and fallings of the lid, forced up by the expanded vapour. He has heard of men who regarded steam as capable of becoming a strong and untiring servant of mankind, and now sees those feeble heavings of its infantine energies with some strange fluttering anticipations. New thoughts crowd upon him, from which he, closely interrogating, sees other, and still more startling, ideas rise. The quietude of a prison enabled him calmly to follow out and test his opinions, which were published after the Restoration, in a book entitled "The Scantling of One Hundred Inventions." Those who can obtain access to the work may read in the sixty-eighth invention the theory of the Marquis of Worcester, and discern the point in the line of discovery to which he reached. The production of steam in one vessel or boiler, and its passage to another, in which its force should act upon the machinery, were included in his theory, and this is still the principle of action in our modern engines. Thus the Marquis of Worcester first marked out the plan of this mighty machine.

A great step was now made in the discovery; the notion of the boiler in which the steam was raised from the water by heat, and the cylinder in which the expansive vapour is kept ready for action, were now exhibited to the active speculations of men. Let us mark the second great stage in the progress. This is also due to an Englishman, Sir Samuel Morland, who was master of the works to Charles II. and of such fame as an engineer, that Louis XIV. sought his assistance in some of the great works which distinguished his reign. When the powers treasured in steam became known, by the experiments of the author of "The Hundred Inventions," Morland began to examine the capabilities of heated water to produce a certain amount of steam. This was walking in the right path, avoiding all useless speculations and blind experiments for the road of patient investigation. To ascertain the volume of steam produced from a given quantity of water, was of the highest importance to the successful working of the new power. To use so dangerous a force without being able to calculate its effects, would have only resulted in disappointments, which might have led men to abandon the discovery already made, and thus have retarded the progress of the great machine. To prevent the new auxiliary from becoming the master instead of the servant of men, it was necessary to calculate its powers, observe its workings, and note, with a nice discrimination, its various developments. In this work Morland succeeded so well, that his results differ but little from those derived from the experience of our times. He drew up tables, exhibiting the expansions of certain volumes of water into steam, and thus supplied future engineers with a guide for their operations.

Two points were now gained,—a knowledge of the manner in which the steam should be collected for its appropriate action, and of its probable force when obtained. The boiler, the cylinder, the steam, were now prepared; who made the next advance, and what was its character? Denis Papin, a Frenchman, was driven from his native country by the cruelty and folly of Louis XIV. who, by revoking the edict of Nantes, compelled vast numbers of his Protestant subjects to leave France, and carry their ingenuity and industry to England. Papin became an intimate friend of Boyle, the scientific chemist, and a Fellow of the Royal Society. Some *gourmands* only know him as the inventor of a machine for extracting soup from bones, which apparatus is called "Papin's Digester," wherein, by the heat of steam, the largest bones are made to yield nutritious matter. Papin's studies, however, conducted him to objects of far greater importance than the preparation of soups, or the development of culinary arts. The reader is supposed to know, that, in order to communicate motion to a machine by steam, a bar, called a piston, must be moved to and fro by the force of the vapour. It is easily seen that a jet of steam rushing against one end of the piston will move it forwards; but how can it be brought back again? Only by the *withdrawal* of the steam, or by its *reduction to water*, in which case the piston will again be forced down by the mere weight of the atmosphere, acting with a pressure of 15lbs. on each square inch of surface. But how reduce the steam to the water whence it rose? By letting water flow upon the expanded vapour, which will then be instantly condensed to hot water, and permit the piston to fall through the vacuum thus produced. By such a succession of steam-jets pushing forwards the lever, and the condensation allowing of its return, is the whole movement of the steam-engine effected. The easy and ready production of the vacuum under the piston may be ascribed to Papin, who thus presented the steam-engine to the world, ready for all work, either upon the surface, or beneath the earth in deep mines. But much was yet required ere the power of the machine could be usefully developed; it might at that stage be likened to a strong-bodied, but rude and

awkward man, summoned to act as a soldier. The drill-sergeant looks at the raw recruit, and sees with pleasure the store of rough power lying in those bones and muscles, but also thinks of the drilling necessary to reduce that clumsy form to soldier-like activity and facility of movement.

The steam-engine was now fairly in the world, but as yet rude and cumbrous in its workings. But Science has taken it under her charge, and issues her commands to various teachers, who shall bring it to a beautiful precision and hair-breadth accuracy in its gigantic movements.

Captain Savery now begins his experiments, and, by various devices, advances the steam-engine to greater efficiency; he invents gauge-pipes, to indicate both the consumption of water and the production of steam, by which the chances of accidents are lessened, and further control obtained over the giant which men had set to work. Additional command was acquired by the introduction of the safety-valve to Savery's engine by Dr. Desaguliers, a clergyman, and lecturer on science in London; until this improvement was introduced, the engine-worker felt in constant dread of sudden explosions. The draining of deep mines was the great object to which these steam-engines were devoted; but they were unable to raise water more than ninety feet, a second or a third engine being used in the case of greater depths. Thus, if it were required to raise water from the depth of 270 feet, the first engine raised the water to a reservoir ninety feet from the bottom; from this reservoir the second engine raised it ninety feet more; making in all 180 feet; when the third engine began its operation, and raised the water to the surface. A vast expenditure of force was therefore necessary in these machines, and an immense outlay of fuel became requisite, all of which were serious drawbacks to the efficiency of the engines.

Thus, much was yet required to bring the steam-engine to its present high point as a moving force. Some improvements were effected by Newcomen, an iron-founder of Dartmouth, who took out a patent, and introduced his engines into extensive use; but these details need not detain us from the great inventions of the far-famed James Watt, who may be called the creator of the modern steam-engine, so numerous were his inventions, and so beneficial their results. To give an outline of his life is not our present object, but rather to describe the steps by which he perfected the machine, and reduced its once irregular and dangerous movements to a beautiful precision and security.

Watt's attention was first called to the defects of the existing engines by the examination of one made by Newcomen, and he soon perceived the rich harvest of fame and profit in store for the man who should develop the full powers of the steam-engine. He saw the *mode* in which this might be effected, and beheld the path leading to the temple of glory; but his instruments were too feeble to carry out his vast designs, and for a period many a bright idea was secluded in his thoughtful, scientific mind. At length, Boulton of Birmingham became the partner of Watt, placing a part of his foundry at the disposal of his friend, upon which the progress of Watt began.

The production of improved machinery was absolutely requisite to produce that smoothness of motion essential to the easy working of gigantic beams, rods, and pistons, which should combine the easiest motion with the utmost tightness in the cylinder, in order to confine the highly expanded steam. Mechanists could not be found to execute such delicate works: workmen were therefore to be trained ere Watt could exhibit his clear conceptions in operation. Many pages would scarcely suffice to describe fully the severe and simple logic, the subtle contrivances, and brilliant theorizing, by which he developed many of his improvements; we must content ourselves, therefore, with a statement of *results* only. Many of these consist of former disco-

veries worked up to greater precision: thus the steam under the piston was condensed before the time of Watt, but he detected much clumsiness in the method of effecting this, and much incompleteness in the work, as *all* the steam was not condensed, and the descent of the piston was therefore partly resisted by the remaining vapours. A great loss of power was the inevitable result of this error. The attempt to correct the defect led Watt into some most abstruse calculations, which he was compelled to pursue by theory alone, and reached, at last, by a beautiful guess, the truth sought. He also saw that the injection of water into the cylinder at all must cool the piston as it descended, whereas this should be kept as hot as the steam itself, which otherwise would be turned to water and its power lost. To remedy this, another series of thoughtful investigations, descending into the deep mysteries of latent and sensible heat, became necessary before the difficulty was overcome.

One of the most beautiful conceptions of Watt is shown in the arrangement called the "parallel motion," the object of which was to secure the steady and upright working of the piston; for in such rapid movements the slightest twisting of the works would soon shatter the machine. The production of such a direct motion may appear a simple matter, but it required all the mechanical skill of Watt's well-trained intellect to solve the delicate problem. The reader must remember, that a rod, suspended perpendicularly to one end of a moving beam, will not rise and fall in a straight line, but in a peculiar curve. This divergency of motion must shake and loosen the works, so as to destroy their airtight character. The problem proposed was to find a point, in the rod which, notwithstanding its oscillatory movements, *should always remain in the same straight line*; could this be discovered, the whole of the action might be kept free from undue vibrations. Such a point was found, and Watt enabled to apply all those improvements which depended upon the movement just described.

Another step now made gave additional security to the steam-engine, and illustrated the skill of Watt in overcoming difficulties. A valve, called the "throttle," regulated the supply of steam from the boiler; but the care required for its management was more than could be obtained from any save the most attentive workmen. Watt resolved, therefore, to make his engine its own regulator; and, after a train of hard thinking, invented the machine called "the governor." The principle was, to secure some means of making the increased velocity of the engine the means of checking the in-rush of the steam, and so reducing the undue rapidity of motion; whilst a too slow movement increased the supply of vapour and accelerated the action. Thus the most perfect regularity was secured by methods which excite the admiration of all who are able to appreciate the beauties of scientific mechanism.

These instances are sufficient to indicate the nature of the numerous improvements introduced by Watt, whose efforts excited the emulation of a host of followers, who have carried the powers of the steam-engine to a degree beyond the most sanguine expectations of Watt; so that whilst he could only promise a force sufficient to raise 500,000 lbs., others have furnished engines capable of lifting 125,000,000 lbs.; thus giving an increase of power in the proportion of 250 to 1. To these subsequent steps Watt, however, pointed the way; and since his time every part of the engine has been made a study, and various improvements in boilers, pistons, valves, wheels, furnaces, and smoke-tubes, have rewarded the perseverance of the engineer. Every day fresh discoveries may be expected to arise, by which a more excellent construction and simpler working shall be obtained. Since the opening of the Liverpool and Manchester railway, fresh facts have been accumulating for the guidance of our land-steamers, and from the time when Fulton cut the waters of the Hudson, divers ex-

periments have been yearly advancing the capabilities of steam navigation.

Whether this power of modern times shall continue its progress, or be laid aside for some combination of mightier forces, we know not; but, whilst we revere the divines, moralists, and poets, who have formed our earliest thoughts, let us also honour those who have discovered a means of uniting remotest nations in one bond of fellowship, and carrying civilization to distant lands. The discoverers in physical science must not be deemed mere caterers for our bodily pleasures, but men commissioned to aid in extending the noblest interests of mankind.

SPRATT AND FORBES'S LYCIA.

(SECOND NOTICE.)

THE second volume of this work will prove more attractive to the generality of readers than its predecessor, inasmuch as it contains less antiquarian detail, and is valuable to those who are seeking to improve their knowledge of the natural history, botany, and geology, &c. of Lycia. It opens with the account of the embarkation of the party for Rhodes; and details the views and melancholy end of Mr. Daniell. It is gratifying to find, from the last written documents of this gentleman, that much that he saw in his last journey corroborated the accounts given us by Captain Beaufort, one of the earliest explorers of those regions. The doubtful point in philology is mooted, as to whether the rock tombs are the construction of the normal Lycians or the Persians; in philology, so to speak, as it is by the inscriptions on these tombs that we are enabled to come to any conclusion. It seems, judging from the evidence here adduced, in addition to the previous observations and opinions of Mr. Sharpe, who has given great attention to the subject, that these monuments were the work of the Persians, and erected by them soon after their settlement in the country. The leech merchants collect their prey in a curious fashion.

"In the fountains on the yallahs, where we found the little Paludina, a Planaria abounds, identical with our common British Planaria fusca; and, in the marshes and lakes, such as Caralitia, the medicinal leech is plentiful. It is equally abundant in the marshes of the low country. In those near Xanthus, the leeches are gathered all the year round; but in the highlands, only in summer. To collect them, people go into the water, wading about with their legs and thighs bare, so that the leeches may stick to their skin. They then scrape them off, and put them into a bag. The leech-merchants carry them away in linen bags, which they soak in every stream or pool they came to. Each carries many of these bags suspended in a basket, and kept apart by twigs. Every day, such of the leeches as may have died are separated from the living, and thrown away. Smyrna is their usual destination, whence they are forwarded to the ports of France and Italy. The leeches are farmed by the Agas, but there is a profitable contraband trade driven. They are sold by the gatherers for about one hundred and twenty piastres the oke; which, even though a great many die, gives a large profit to the merchant. Sometimes, however, all die. There is a leech-bazaar held at Caisabar."—Vol. II. pp. 76, 77.

There is a species of spider, the Mygale, "that lives in a tube of earth, closed at its aperture by an earthy door, which opens and shuts for the entrance and exit of the animal, being suspended by a kind of hinge, constructed out of the silky web." It is presumed, this little Diogenes encloses many

an unwary victim in his den, whose power of escape must be small indeed, when once he enters the black hole. The "*lasciate ogni speranza voi ch'entrate*," should be the motto of this dismal abode.

Aristotle's observations, in his *History of Animals*, are entirely borne out by the investigations of the Lycian tourists. It is something to the credit of ancient writers, that that which was written ages ago is in commercial phraseology the staple commodity of our times. It has been often insisted on, that the work of the great naturalist should be more generally read than it is.

"The traveller who, when treading the shores of the coasts and islands of the *Ægean*, observes, as he can scarcely fail to do, the innumerable remains of the hard parts of cuttle-fishes, piled literally in heaps along the sands, or, when watching the Greek fishermen draw their nets, marks the number of these creatures mixed up with the abundance of true fishes taken, and equally prized as articles of food by the captors, can at once understand why the naturalists of ancient Greece should have treated so fully of the history of the *Cephalopoda*, and its poets have made allusions to them as familiar objects. In an English drama, such allusions would be out of place, and misunderstood. To a Greek audience the mention of a cuttle fish was as the mention of a herring among ourselves. The mob above the *diazoma* would appreciate the former, as the gods in our galleries would recognize the latter, as part and parcel of their household furniture. One of the most striking spectacles at night, on the shores of the *Ægean*, is to see the numerous torches glancing along the shores, and reflected by the still and clear sea, borne by poor fishermen, paddling as silently as possible over the rocky shallows, in search of the cuttle-fish, which, when seen lying beneath the waters, in wait for his prey, they dexterously spear, ere the creature has time to dart, with the rapidity of an arrow, from the weapon about to transfix his soft but firm body. As in ancient times, these mollusks constitute now a valuable part of the food of the poor, by whom they are chiefly used. The imprecation of the chorus, who, calling down upon their victim the extremity of ill fortune, desired that he might be reduced to a single cuttle-fish, and that a dog might come and snatch this last poor morsel from him,¹ would be as well appreciated in a modern Greek coffee-house, where curses, deep and lengthy, are now liberally bestowed by enraged gamblers on their successful opponents, as among the original admirers of Aristophanes. The Romans, if we may judge from the culinary receipts of Apicius, regarded a cooked cuttle-fish with more respect. We can ourselves bear testimony to its excellence. When well beaten, to render the flesh tender before being dressed, and then cut up into morsels, and served in a savoury brown stew, it makes a dish by no means to be despised, excellent in both substance and flavour. A modern Lycian dinner, in which stewed cuttle-fish formed the first, and roast porcupine the second course, would scarcely fail to be relished by an unprejudiced epicure in search of novelty.

"Granting, however, all the facilities of observing cuttle-fishes, which the *Ægean* pre-eminently affords, the account of the habits and structure of these animals, in the writings of Aristotle, must ever remain among the most admirable natural history essays ever written. If we bring together all that he records of these creatures in the several books of the *History of Animals*, we cannot fail to appreciate the position of the Stagyrte, as the greatest of naturalists, past and present; for none among them all ever combined such extraordinary powers of observing equally the structure of the individual and the habits of the species, with the highest capacity for generalization. Each fact narrated

(1) In the *Acharnes* of Aristophanes.

by Aristotle seems always to be told with reference to some law, floating, as it were, before his mind's eye, and to be fixed through the determination of the instance. Everything, too, is told in perfect good faith; hearsay narrations are related as such, and carefully distinguished from personal observations; a feature which places the natural history writings of Aristotle on a par with the highest productions of modern science. This cannot be said of any other ancient author who has treated of similar subjects. The philosophical spirit which pervades the *History of Animals*, distinguishes it from, and elevates it above, the great majority of the natural history writings of the moderns, and renders the study of that great work a sound course of reading in the education of the student of natural history. Or rather, such should be; for, unfortunately, the acquaintance of too many modern naturalists, with the writings of the Stagyrte, is confined to the bare knowledge of the existence of his memorable *History*."—Vol. ii. pp. 91—95.

In that very clever novel, "*The Falcon Family*," the history and habits of the human Sponge are detailed with capital humour and effect. We have here an account of the *Sponge of Commerce*.

"The sponge of commerce is found attached to rocks in various depths between three fathoms and thirty. When alive it is of a dull bluish black above, and of a dirty white beneath. There are several qualities, possibly indicating as many distinct species. The best are taken among the *Cyclades*. The sponge divers, however, are mostly people from the islands of the *Carian* coast; from *Calymnos*, and the islands between *Calymnos* and *Rhodes*. They go in little fleets of caiques, each of six or seven tons burden, and manned by six or eight men. The season for the fishery lasts from May until September. All the men dive in turn. They remain under water from one to three minutes. They descend to the bottom at various depths, between five fathoms and twenty, or even, though rarely, thirty. Very few of the *Archipelago* divers can descend so deep as the last-named depth, and it is doubtful whether they can work, in such case, when down. Some years ago a diver asserted he had bent a rope round the beam of a Turkish frigate, sunk in thirty fathoms water off *Scio*. Mr. Love, when engaged in raising the guns of some of the sunken ships, confirmed his statement, by finding the rope still bent round the beam. In deep water, a rope weighed by a stone is let down, by which the divers ascend when they have gathered the sponges. They carry nothing about their persons except a netted bag, which is attached to a hoop suspended round their necks; in this they place the sponges. In a good locality a diver may bring up fifty oke of sponges in a day. A very large sponge may weigh two okes. The weight is calculated from the sponges when they are dried. A sponge is dried in the sun, after being cleaned in sea-water; fresh-water rots it and turns it black. The slimy or animal matter is stamped out by the diver's feet. When dried, the sponges are strung in circles. They are sold at twenty-five drachmas an oke. The chief markets for them are *Smyrna*, *Rhodes*, and *Napoli*.

"The sponge fisheries were probably conducted among the ancient Greeks as they are now. Hence, information being obtainable with facility, we find a full account of the sponge in the writings of Aristotle. He appears to have been deeply interested in its history, on account of the link it seemed to present between the animal and vegetable nature. Therefore the question, whether sponges possessed sensation, is discussed by him more than once, and left undecided; the statements for and against their capacity of feeling are, however, fairly put forward. The same question is debated among naturalists at the present day, and, as anciently, there are not wanting advocates for either view. Aristotle distinguishes sponges under two heads, those that might be cleaned, and those which could not. Of the last he states that their substance was compact, but

perforated by large canals. They were more viscous than other sponges, and when dried, remained black. The description exactly applies to the common coast-line sponges of the Egean, useless for economic purposes. His account of the sponges of commerce is more detailed. He distinguishes three varieties: those which were lax and porous; those of thick and close texture; and a third kind, called sponges of Achilles, finer, more compact, and stronger than the others. These last were rarest, and used to be placed in helmets and in boots, as protections from pressure for the head and feet. They all grow on the rocks, adhering not by one point only, nor by the whole surface, but by some extent of the surface. The best kinds grow on the coasts which become suddenly deep. He attributes the superior fineness of texture in these deep-sea kinds to the greater uniformity of temperature of the water in such places. When alive, and before they are washed, they are black. Their canals are often inhabited by little crustacea. Such are the leading points of the account given of sponges in the fifth book of the *History of Animals*.—Vol. ii. pp. 124—128.

It happened, unfortunately, that our travellers were compelled to leave at a time when vegetation was at its greatest height and beauty; malaria of the most fatal kind would have encompassed them in its deadly fangs, had they played the laggard. They contrived, notwithstanding, to obtain a great many plants, some of which were new to the British flora. There appears to be an abundance of herbs. Anemones of all sorts abound, and some pretty varieties of the fritillary. The last chapter is devoted to the consideration of the geological structure of the country. The fact of many of the rock tombs appearing lower than they originally were, is fully accounted for by the increase in the thickness of the soil, which without doubt contains many treasures of antiquity embedded in it. There is an ingenious explanation offered of the nature and causes of the singular changes of form in the Cos fresh-water beds. Three appendices complete this volume; but for their contents we must refer our readers themselves to judge by personal examination. To those who take an interest in this part of Asia, these volumes cannot fail to prove a valuable acquisition; and it is to be remembered, that by the efforts only of diligent and accurate inquirers on the locality itself, can we arrive at any certain knowledge of a country,—its customs, manners, and peculiarities.

ENGLISH SCENERY.

DESCRIPTION OF A PICTURESQUE LANE.

ALL painters who have imitated the more confined scenes of nature, have been fond of making studies from old neglected bye-roads and hollow ways; and perhaps there are few spots that, in so small a compass, have a greater variety of that sort of beauty called picturesque; but I believe the instances are very rare of painters, who have turned out volunteers into a gentleman's walk or drive, either when made between artificial banks, or when the natural sides of banks have been improved.

Perhaps what is most immediately striking in a lane of this kind is its intricacy. Any winding road, indeed, especially where there are banks, must necessarily have some degree of intricacy; but in a dressed lane, every effort of art seems directed against that disposition of the ground—the sides are so regularly sloped, so regularly planted, and the space, when there is any, between them and the road, so uniformly levelled; the sweeps of the road so plainly artificial, the verges of grass that bound it so nicely edged—the whole, in short, has such an appear-

ance of having been made by a receipt, that curiously, that most active principle of pleasure, is almost extinguished. But in hollow-lands and bye-roads, all the leading features, and a thousand circumstances of detail, promote the natural intricacy of the ground; the turns are sudden and unprepared—the banks sometimes broken and abrupt—sometimes smooth and gently, but not uniformly, sloping—now wildly overhung with thickets of trees and bushes—now loosely skirted with wood—no regular verge of grass, no cut edges, no distinct lines of separation—all is mixed and blended together, and the border of the road itself, shaped by the mere tread of passengers and animals, is as unconstrained as the footsteps that formed it. Even the tracks of the wheels—for no circumstances are indifferent—contribute to the picturesque effect of the whole; the varied lines they describe just mark the way among trees and bushes—often some obstacle, a cluster of low thorns, a furze bush, a tussock, a large stone, forces the wheels into sudden and intricate turns—often a group of trees or a thicket occasions the road to separate into two parts, leaving a sort of island in the middle.

These are a few of the picturesque accidents, which in lanes and bye-roads attract the notice of painters. In many scenes of that kind, the varieties of form, of colour, and of light and shade which present themselves at every step are numberless; and it is a singular circumstance, that some of the most striking among them should be owing to the indiscriminate hacking of the peasant, nay, to the very decay that is occasioned by it. When opposed to the tameness of the poor pinioned trees—whatever their age—of a gentleman's plantation, drawn up straight and even together, there is often a sort of spirit and animation in the manner in which old neglected pollards stretch out their limbs quite across those hollow roads, in every wild and irregular direction; on some, the large knots and protuberances add to the ruggedness of their twisted trunks; in others, the deep hollow of the inside, the mosses on the bank, the rich yellow of the touch-wood, with the blackness of the more decayed substance, afford such variety of tints, of brilliant and mellow lights with deep and peculiar shades, as the finest timber tree, however beautiful in other respects, with all its health and vigour cannot exhibit.

This careless method of cutting, just as the farmer happened to want a few stakes or poles, gives infinite variety to the general outline of the banks. Near to one of these “unwedgeable and gnarled oaks,” often rises the slender elegant form of a young beech, ash, or birch, that had escaped the axe, whose tender bark and light foliage appear still more delicate and airy, when seen sideways against the rough bark and massy head of the oak. Sometimes it rises alone from the bank—sometimes from amid a cluster of rich hollies, or wild junipers—sometimes its light and upright stem is embraced by the projecting cedar-like boughs of the yew.

The ground itself in these lanes is as much varied in form, tint, and light and shade, as the plants that grow upon it; this, as usual, instead of owing anything to art, is, on the contrary, occasioned by accident and neglect. The winter torrents in some places wash down the mould from the upper grounds and form projections of various shapes, which, from the fatness of the soil, are generally enriched with the moss luxuriant vegetation; in other parts they tear the banks into deep hollows, discovering the different strata of earth, and the shaggy roots of trees. These hollows are frequently overgrown with wild roses, with honeysuckles, periwinkles, and other trailing plants, which with their flowers and pendant branches, have quite a different effect when hanging loosely over one of these recesses, opposed to its deep shade, and mixed with the fantastic roots of trees and the varied tints of the soil, from that which they produce when they are trimmed into bushes, or even along a shrubbery, where the ground has been worked into one uniform slope. In the summer-time these

little caverns afford a cool retreat for the sheep, and it is difficult to imagine a more beautiful fore-ground than is formed by the different groups of them in one of these lanes; some feeding on the patches of turf, that in the wider parts are intermixed with the fern and bushes; some lying in the niches they have worn in the banks among the roots of trees, and to which they have made many sidelong paths; some reposing in these deep recesses, their bowers

O'er-canopied with luscious eglantine.

—*Sir Uvedale Price on the Picturesque.*

Poetry.

In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.

COUNT GERO OF MONTFORT.¹

From the German of Schwab.

BY THE REV. HENRY THOMPSON, M. A. CANTAB.

It was De Montfort, age-worn knight,
Gaz'd on the lake's blue deep,
And mark'd the shallops float in light,
On the still wave asleep;
Earth, water, heaven, in dead repose;
And yearn'd to be at peace like those.

And, as he from that trance awoke,
He call'd his followers true,
And words of love and blessing spoke,
And bade a last adieu;
Took leave of lordship, towers, and land,
And rode to the far distant strand.

And lo! while there he listening stood,
Up sprang a freshening breeze;
And straight St. Peter's Abbot good
Upon the beach he sees.
A skiff with swelling sail lay nigh;
O, but his heart beat yearningly!

St. Peter's House, that stilly spot
Kiss'd by the rippling wave,
His soul, the fires of youth forgot,
Desires for home and grave.
All earthly gaude and joys laid by,
There will he serve his God, and die.

The Churchman's blest that counsel wise;
On board the Count he bore,
And for the cloister, with his prize,
Push'd lightly from the shore.
Now float they on the exulting blue;
O, but the Count exulted too!

Much mov'd, he spake, "O, couldst thou see,
Lord Abbot, half my joy!
That water gazes up at me,
Like mother on her boy!
For know, by yonder rocky Horn,
On shipboard I myself was born:

And as I in this shallop lie,
Rock'd on the glittering deep,
I feel once more in infancy
On cradle couch asleep;
My mother's voice is murmuring nigh,
And fills my ear with lullaby."
Meanwhile the bark drives cheerily on;
They see the tall Horn rise;
The Count, with mingling thoughts foredone,
Closes his weary eyes;
And by the rudder's even play,
Stretch'd on the deck he slumbering lay.

And as the light bark sweeps along,
His natal spot they near;
Then fell his mother's cradle song
So softly on his ear!
He opened his eyes, and cried, "How deep,
O mother, was that blessed sleep!"
He droop'd his weary lids once more,
Yet deeper on to rest.
Stay, shallop, stay! thy course is o'er—
In haven is thy guest.
The Abbot kneels before him now,
And signs the death-cross on his brow.
Make in the holy house his grave;
Amid the chantry lay:
By the warbling wave, at first that gave,
And now hath ta'en away:
In gentle peace, secure from harms,
He slumbers in the blue lake's arms.

*Rectory, Wrington,
Feb. 12, 1846.*

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne.*

BEWARE of misapplying Scripture. It is a thing easily done, but not so easily answered. I know not any one gap that hath let in more and more dangerous errors into the Church, than this,—that men take the word of the sacred text, fitted to particular occasions, and to the condition of the times wherein they were written, and then apply them to themselves and others, as they find them, without due respect had to the differences that may be between those times and cases and the present.—*Bishop Sanderson.*

AVOID as much as possible multiplicity of business. Never be curious to know what passes in the world, any further than duty obliges you; it will only distract the mind when it should be better employed.—*Bp. Wilson.*

IMPATIENCE is a quality sudden, eager, and insatiable, which grasps at all, and admits of no delay; scorning to wait God's leisure, and attend humbly and dutifully upon the issues of his wise and just providence.—*South.*

To be happy at home is the ultimate result of all ambition, the end to which every enterprise and labour tends, and of which every desire prompts the prosecution.—*Johnson.*

THOSE who quit their proper character to assume what does not belong to them, are for the greater part ignorant of both the character they leave and of the character they assume.—*Burke.*

Italian Peasant Girl in Prison.

H wherefore sought she daily at one spot
That one returning ray? 'Twas the same light
That on her native hills fell cheeringly:
But in the recollection of those hills
Was surely more of sorrow than of joy,
And she was sad enough. Yet ever still
In very thankfulness she hailed the sun,
Who on his daily pilgrimage of joy
Had e'en a thought for her.

SKETCH OF THE TRADITIONS OF GERMANY.

Let him who in youth has travelled through a poetic country say, when in the evening he has seated himself beside a ruined tower to listen to some old peasant telling him the legend of the castle of whose proud structure it was once a part, whether he has not beheld in imagination the battlements once more rising in frowning state, the banner once more floating above the donjon-keep, the steel corselet once more flashing in the court-yard. In the space of one or two centuries, how entire has been the transformation ! The Gothic chapel, the marble balconies sunk in gradual dilapidation under the hand of time, or in sudden ruin under that of man,—the vast armoury converted into a work-shop,—the steam-boat hissing and whizzing where once was heard only the lute of the lady of the castle, or the harp of the minstrel. But tradition has not yet enrolled amid her records these innovations. With eyes fixed upon the past, she beholds only by-gone days, and gathers up into the folds of her robe only the treasures of olden times. With one stroke of her wand, she can sweep away all this modern machinery, and revive, by memory's magic, the wizard-spells of the old castle, and call up the genius of the poetic past.

And, if there be a country in which we can thus rove at pleasure through the historic legends, the pious illusions, of popular credulity,—that country is Germany. There every plain has its genius, every mountain its mysterious cave, every lake its palace of crystal,—there, the fairy still lives, the sylph still waves its golden pinions,—there, at nightfall, the waters of the Elbe and the Rhine have still their sighs of love, the leaves rustle to the breath of mountain-spirits, and the castles from their craggy steeples recount their tales of war. Nevertheless, the pitiless hand of industrial improvement has been at work there, as elsewhere, amid those valleys peopled with such charming creations, and the Männlein (the Mannikin, the dwarf) has retreated in terror to its mountains. But turning, for a little while, from the railroad, the steam-engine, the factory, leaving Germany to its new system of excise, to its policemen and its merchants, let us invoke old Teutonia, and with one blast upon the wondrous horn of Tradition,—the *Wunderhorn*—resounding from the plains of Silesia to the romance-land of Saltzburgh, from the forests of Bohemia to the Thuringian woods—let us call up around us the slumbering crowd of fables and of sprites.

Amongst the traditions general throughout all Germany there are some whose origin is Oriental, some closely linked with those of India and Greece. These emigrating to the north, have been sung by Odin, and repeated in Scandinavia and in Suabia. Others have come from Provence, and but changed their costume in crossing the Rhine;—others, again, have been brought by pilgrims from the Holy Land, by the soldiers of the crusades. There are many whose origin is uncertain: found equally in the northern and southern provinces of France, in Ireland, and in Denmark, there is nothing to mark precisely the country to which they belong; but the greater part had their birth upon the soil of Germany; and whatever may be their origin, it is a curious thing to study the character of these traditions, to seek under their Germanic garb for the religious symbol or the historic fact they embody. Still more curious would it be to compare them in their numerous coincidences with those of other nations, to trace out their parentage, their successive transformations, and their filiation. But this is a difficult, and often an impossible,

task; for traditions have passed too quickly from one country to another to allow of their route being thus accurately marked out. As Campbell observes in his *Essay on English Poetry*,—"The migrations of science are difficult enough to be traced, but tradition travels on still lighter wings, and scatters the seed of her wild flowers imperceptibly over the world, till they surprise us by springing up with similarity in regions the most remotely divided."

And as no single country has given birth to them, so neither has any one age. They have been formed successively, and joined on like the several links of a long chain. Whenever the people were much excited by any event, or surprised at any phenomenon, they composed a legend, they invented a mythos. They supplied the place of reasoning by poetry,—of science by imagination. The historic legends of the people rest upon a sure basis, upon undoubted facts: but the facts have been adorned till they are wholly concealed, and all that is left us to lay hold upon is a name, or some characteristic trait of manners. Their marvellous legends spring from that mystic worship of nature, that species of secret pantheism, of which the middle ages have always recognised the principle, without ever formally adopting it as doctrine. The Northerners paid religious veneration to the luminaries, to the elements. The Lithuanians regarded the sun as the father of the earth, the moon as his wife, and the stars as their children. The Germans were wont, as they retired to rest at night, to salute the stars, for to them they were the eyes of Heaven; and they held festivals in honour of the summer and winter solstice. They did homage to the wind, and to the tempest, to animate and inanimate nature. Metals had for them peculiar properties; the rock grew on the mountains, and in the waters' depths; the plants contained potent juices, and magic odours; the birds predicted the future, and knew the secrets of men. In one old tradition, a dove guides a traveller to a treasure; in the *Edda*, two ravens relate each day to Odin what passes upon earth;—even the frogs had leached in their war-bells many a curious secret, and guarded in their deep grottoes caskets of gold and diamonds.

In this world of wonders, where each object was thus made instinct with life, and endowed with attributes of power, it is not to be wondered at that mountains so gigantic in their proportions, so wildly irregular in their form, should strike upon the imagination of the men of the middle ages. The people had no very clear idea of what lay behind those curtains of verdure, those immense caverns of stone; and they made of them the abode of fabulous beings, the tombs of their heroes and kings. The *Rosterberg* is filled with gold and silver. The *Ritterberg*, from time to time, was the scene of great miracles;—amongst many others is the following.

Three miners went to work in it for a whole week, and carried with them—the men had faith it must be owned—only their prayer-book, some oil in their lamp, and bread in their wallet for one day. Every morning before going to work, they, kneeling, commended themselves to Providence. One night, just as the oil was beginning to burn low in their lamp, a violent storm suddenly arose. The roof of the cavern in which they were at work is shaken, bursts open the rock, falls in with billows of sand, and the miners are entombed. But God, in reward of their piety, kept an empty space immediately around them, and renewed each day their provision of oil, and their morsel of food. Thus they lived, for seven years, in continual labour to extricate themselves from their prison, and in constant prayer. Their prayers were heard. Once again did they behold the blue sky above their heads, and were given once more to revisit their dear native village.

The *Wunderberg* is the most wonderful of all these mountains. There are found cities like ours, cloisters and churches, ramparts and palaces constructed by the *Männlein* (the dwarfs). There Charlemagne reposes in the midst of his bold peers. He is seated with his

(1) Extracted and translated from "*Souvenirs de Voyage*," by X. Mormier.

crown on his head, his sceptre in his hand, and before him a marble table. His white beard falls upon his chest, and is growing continually. When long enough to go three times round the table, the tree of liberty will again flourish upon the hill, the old emperor will come forth from his cavern, and a new era, an endless period of happiness and prosperity, will dawn upon the earth. But, alas! we of this century cannot hope to live to see that happy time, for the beard of Charlemagne is as yet only of sufficient length to go once round the fated table.

In the Kiffhauseu reposes Frederic Barbarossa, the other great German hero. Many a time has been seen his bald forehead lifted above the rocks, for he often quits his abode to breathe the fresh air. A shepherd who had led his flock to the mountain-top was once lighting his pipe, saying, as he did so, "Frederic, I smoke to thy health." On the instant, the hero appeared to him, and, to reward him for his remembrance of him, led him into a large hall where were a great number of knights. There he displayed to him rich armour, glittering swords, and gave him more gold than would satisfy a prince.

Upon the summit of these mountains, and in these vast caves, is the abode of the giants. Nothing can equal the monstrous size and strength of this race, whose creation, says the Edda, was prior to that of the first man. An immense rock that no effort could shake, is to them but a troublesome pebble in their shoe. An island flung into the midst of the ocean, is to them only a handful of earth which they let fall from their lap. When the god Thor, the god of the thunder, was going through Scandinavia, he came one night upon a large tent, where he slept quietly with his companion: the next day he perceived that his commodious lodging had been the thumb of a giant's glove. When the valiant Dietrich, of Berne, attacked Siegenot, that giant, to defend himself, tore up by the roots one of the mightiest trees of the forest, and the *Heldenbuck* (the Book of Heroes) says that since Adam never had existed so strong a man.

The grottoes of the hills are occupied by the dwarfs, who have also their cycle of traditions. An old German poem says, that God first created the dwarfs to cultivate the ground; then, the giants to destroy monsters; and, afterwards, the heroes to protect the poor dwarfs from the giants. In the symbolism of the North, the giants represent brute-force, mere matter; and the dwarfs the intellectual faculties, the mental powers. Notwithstanding their diminutive size, they are endowed with great strength. They erect splendid abodes, and in winter they forge metals, and fabricate sharp arrows and brilliant armour. No sword so good as that made by them; no helmet resists, as theirs does, the edge of the sword, the weight of the battle-axe. Whilst they are thus employed, their women spin the finest wool, the most delicate flax. The dwarfs are handsome and graceful, but so small that they can go through a key-hole. They marry, and bring up their children as Christians,—those of the Wunderberg sometimes go to the church at Saltzburgh. They are fond of dancing and music. Often in the fine summer evenings, they set off to dance in the meadows, and next day may be seen in the grass the wide circles they have marked. They love, also, to walk over the hills, to draw near to men, and to converse with them. They pity all that suffer, and reward generously any interest evinced in them, or any service rendered to them. Often have they protected the weak, maintained the cause of the oppressed, and woe to him who is guilty of an injustice, if they be called to avenge it. Should any one lose his way near their abode, they come to meet him, and bring him home to the shelter of their rocky roof.

One night, a student of Gottingen was surprised by a storm on the hill of Plissas. The rain had soaked

his dress, and the darkness was so great that he could not retrace his way. Suddenly there came up to him a *münnelein*,—a little man, quite grey,—who, taking his hand, led him through a cleft of the rock into a subterranean apartment, luxuriously fitted up, and brilliantly lighted. There was the wife of the *münnelein*, dressed in a robe of silk, richer far than was ever worn by wife of burgomaster; and there were his brothers, and his daughter, with her fair hair falling over her shoulders, and her exquisitely soft blue eye. The student thought her charming, and seeing her surrounded by such riches, would gladly have asked her in marriage, but that he was afraid to lose her on his way home to Gottingen, so infinitely small was she. They sat down to table, conversed on the topics of the day, the wars of Italy, and the death of the emperor; then each one knelt down, and the mistress of the house prayed; and, when the prayer was ended, the young girl took a silver torch, and led the student to the room prepared for him. The next day he left them reluctantly, for the short time he had passed with the family of the dwarf sufficed to make him attached to them. The *münnelein* gave him several precious stones, and the young girl smilingly handed him a cluster of nuts. On his arrival at Gottingen the nuts were so many fine pieces of good gold. From that day the student made many an effort to find the rocky door by which he had entered, but was never able to discover it.

Sometimes, too, the dwarfs ask hospitality from men, either because they find themselves too far from home, or because they wish to celebrate some solemn festival in more than ordinary state. One of them came one day to ask of a count, their neighbour, permission to dance in his castle. The count gave permission, and that very night a whole host of dwarfs descended from the hill, and spread themselves over the gardens, through the tufted hedges, and into every apartment of the castle. Some light the fires in the stoves, and prepare the supper; others, bearing garlands of flowers and silken tissues, hasten to decorate the hall. In a moment, the lustres are arranged—the golden torches blazing on the walls, and reflected in the mirrors. The dancers take the hand of their partners, the musicians tune their instruments, and the ball commences. What delight was there!—the whirl, like that of a set of birds taking their flight from the valley—like that of the leaves, the harvest which the wind has been reaping from the forest. The count himself joins in the merry round: they allot to him the tallest of all the dancers, but she whirls so rapidly that he cannot follow her. After the ball, all the tables were covered with embroidered cloths, with gold and silver plate. The dwarfs led the owner of the mansion to the place of honour, and helped him to meats of exquisite flavour, and to wines kept for centuries in marble butts in the mountains. Then all disappeared as if by magic, and the next day two delegates from the kingdom of the dwarfs came to thank the count for the hospitality he had extended to them, and presented him with a sword and a ring, telling him that these two treasures would bring him good fortune for ever.

Near akin to the family of the dwarfs are the race of Elves; but the latter are of a more refined and poetic nature. They are the brothers of the bright Djinn and of the Peri, brothers to Ariel and to Irisby. Their face is of the hue of the lily, and their vesture is woven of the moon-beams. They inhabit not the dark bowels of the mountains; they float about in the air, and balance themselves like the gilded butterfly on the slender stalk of a plant; a leaf serves them for pavilion, and they can live for a whole day on a little honey extracted from the cup of a flower, or on a dew-drop. The wives of the elves are of beauteous form and lovely face; they dance and sing all night upon the hills, and their voices are so soft, their singing so harmonious, that every passer-by pauses to listen. But none must approach them, none must mingle in their dance, for their look

(1) The same tradition exists in Normandy.

congeals the heart, and their kiss is death. The elves wear little glass slippers. He who could seize upon one of these slippers would be a rich man, for its owner would redeem it at any price.

There is another race, kindred with this, but less wandering than the elves, more social than the dwarfs,—I mean the race of domestic sprites, who seek for themselves a lodging in the peasant's cot, sleep in the barn, and warm themselves at the family hearth. The Germans call this sprite Kobold: he is the *Brownie* of Scotland, the *Servant* of Switzerland, the *Trolle* of Denmark, the *Goblin* of Normandy. The kobold is busy and active; he takes care of the horses, cleans the stable, guides the plough, and works at the harvest. If he be given no cause of offence, the masters of the house may take their ease, and the servants sleep in peace, for with the first light of day all the work is done. To secure his services for ever, it is only necessary to put every day a little milk in one corner of the house, and to sweep and keep clean and neat the room he occupies. In proportion as the kobold is zealous and devoted while he is pleased, so is he capricious and vindictive when offended. A young girl had a kobold in her service, and it was a blessing to see how he anticipated all her wishes,—how he exempted her from every troublesome task. One day she threw, in joke, some dirt into the cup of milk he was about to drink, and from that moment the kobold forsook her. She is now obliged to get up early, and to go to bed late, to toil incessantly, and yet, all the while, not to see her work advancing. Every day the implacable Kobold puts some fresh obstacle in her way; every day he compels her to endure some new misfortune. She takes up, with the greatest caution, a precious vase, and breaks it;—she warms water, and burns her fingers;—she prepares dinner, and puts a double quantity of salt into one dish, and none in the other. When we find fault with our cooks for breaking culinary laws, we are quite wrong,—the whole fault may lie with the kobolds.

The good Holla is the queen of domestic servants; it is she who encourages the young girls to work, and aids them in their efforts; it is she who comes at night to fill their distaffs with flax, to turn their spindles;—in short, she is the patroness of the German women, retired and modest, industrious, frugal, and contented.

Some parts of Germany admitted another sprite, also called a familiar spirit,—*spiritus familiaris*. He was put into a phial, and there was no more trouble about him. Every wish was carried out by a silent act of volition on his part. But he came from hell, and it was necessary to take good care and keep him in strict durance to the very moment of death, for otherwise he would carry you straight with him into darkness. A most difficult thing it was to get rid of him; the evil spirit had his mission to perform, and that was to take some one to the devil. Throw him into the water, he floats; pound him under a stone, he revives at once; put him into the fire, he comes out more brisk than ever. The only method of preventing his return is to put him into another house, or to sell him. A horse-dealer, reduced to poverty by a series of misfortunes, bought one day a little box from a stranger, who handed it to him as a talisman of good fortune, recommending him to keep it secret, and never to open it. From the moment this box came into his possession, the whole aspect of his fortunes changed. He found a treasure; he resumed his business; he undertook some bold and rash speculations,—not one failed. But his wife, a pious woman, began to suspect that some kind of sorcery was at the bottom of such wondrous luck. She opened the mysterious box one day, and beheld a great black fly make his escape through the window; a passer-by picked it up. From that hour the fortunes of the horse-dealer rapidly declined, and he became poorer and more wretched than ever.

(To be continued.)

SOME ACCOUNT OF DR. RADCLIFFE.*

DR. JOHN RADCLIFFE, the celebrated physician, whose name is perpetuated by his splendid benefactions to the University of Oxford, was born in Yorkshire, in the year 1650. Though, we are informed, his father was more intent on the improvement of his paternal acres, than on the cultivation of letters, yet his son early showed so much ability, that he resolved on giving him the advantage of a liberal education.

From the grammar-school, at Wakefield, where he made great progress, he was sent, at the early age of fifteen, to University college, Oxford; there he took his degree of B.A., in due time, and was made senior scholar of his college; but, as no fellowship became vacant, he removed to Lincoln college, of which he had previously been invited to become fellow. Having decided on the profession of medicine, he now gave himself up to the study of physic, and attended the different courses of anatomy, chemistry, and botany, delivered in the University. He took his degree of Master of Arts, in 1672, as it is said, with uncommon applause. It was his boast, that he did not prepare himself for the practice of the art of healing, by what he considered an useless application to the musty volumes of ancient medical science, but by a careful examination of the most valuable treatises that made their appearance in his own times. His books, while he was a student of medicine, though well chosen, were so few in number, that, being visited by Dr. Bathurst, the Master of Trinity college, and asked by him where was his library, Radcliffe replied by pointing to a few phials, a skeleton, and a herbal, in one corner of his room.

He became Bachelor of Medicine in 1675, and immediately began the exercise of his profession in the city of Oxford itself. At his first entrance upon the stage of action, he fell foul of the apothecaries, and experienced no small opposition from some of the most eminent of that calling, who decried his method of practice as being contrary to the one adopted by Dr. Lydal, at that time the most celebrated practitioner in the University. The method of Lydal was slow; that of Radcliffe, expeditious, prompt, and decisive; and his good sense, and superiority of talent, soon became so conspicuous, that his opponents, the apothecaries, were soon obliged to make interest with him,—“to have his prescriptions on their files.”

His success, as may readily be believed, was not received without feelings of envy, and his rivals maintained that his cures were all guess-work, and affected sarcastically to regret, that his friends, instead of breeding him up to physic, had not made a scholar of him. On the other hand, Radcliffe was not wanting in his own defence, nor sparing of abuse towards his antagonists, whom he bespattered with all sorts of opprobrious names, and derided, because of the slops, caudles, and diet drinks, with which they drenched their patients.

It was neither, however, by his abuse of others, nor by any empirical boldness, that, at this early period of his medical career, he seems to have completely gained the confidence of the public, but by his judicious method of treating the small-pox,—a method, indeed, which Sydenham had introduced into the art of medicine about ten years before Radcliffe established himself in Oxford. It consisted in the employment of the cooling treatment—a practice which seems to have been partly suggested by reasoning upon the nature of the disease, and which was amply sanctioned by experience. In

(1) Abridged and altered from “Lives of British Physicians.”

his original treatise on the small-pox, Sydenham dwells much upon the salutary influence of cold on those worst and most aggravated forms of that disease, which were sometimes brought on by the pernicious use of the heating and stimulating treatment then in vogue. This new method, however, was mistrusted by the faculty generally, who preferred following the ancient course. Radcliffe was free from the prejudices of his brethren; and one of the first fruits he reaped from his early determination to leave the trammels of authority, and willingly admit the light of recent discovery, was the most remarkable success of his practice in this very disease, in which he strictly followed the precepts laid down by Sydenham.

The small-pox was raging in the city and neighbourhood of Oxford, with great fatality; and, instead of stoving up his patients, as was done by other practitioners, Radcliffe employed the new method—exposed the sick to the free access of air, gave them cooling emulsions, and employed other approved antiphlogistic remedies,—and thus rescued more than one hundred from the jaws of death.

His success in the case of Lady Spencer, who appeared to be sinking under a complication of disorders, further spread his fame, and brought him into fashion among that lady's numerous connexions. So that, before he had practised two years, there were few families of credit, within reach of Oxford, who had not occasion to appreciate his professional skill.

Having received some affront, he quitted Lincoln college, and resigned his fellowship, but continued to reside in Oxford till his thirty-fourth year, when he removed to London, and settled in Bow-street, Covent Garden; there he had not been established more than a year, before he rose to the head of his profession, and received in daily fees the sum of 20 guineas. To this rapid success the pleasantness of his discourse, and his ready wit, are said greatly to have contributed; many even feigned themselves ill, for the pleasure of having a few minutes' conversation with the facetious doctor.

In 1686, he was appointed physician to the Princess Anne of Denmark; but his characteristic prudence prevented his ever being carried away by the *éclat* of royal patronage. During the triumphant progress of the Revolution, he was urged to accompany his distinguished patient to Nottingham, whither she went with the Bishop of London, there to remain till the storm should blow over; but, though sympathizing with the movement, he would not compromise himself to a cause involved in such risk, but made his numerous patients an excuse for remaining in London. And, even when William was fairly established on the throne, he declined the appointment of king's physician, with a salary higher than had yet been given to the office. The king, from gratitude, and admiration for the skill he had shown in the treatment of two of his foreign attendants, Mr. Bentinck (afterwards Earl of Portland) and Mr. Zulestein (Earl of Rochford), had presented him with 500 guineas at the time of offering his further patronage. The caution and worldly wisdom of Radcliffe were here again exhibited; for though he accepted the present, he begged to decline the appointment, considering that the settlement of the crown was then only in its infancy, and that accidents might occur to disturb its security. Nor did he lose by his refusal: for the weak condition of the king's health, who had, from his childhood, suffered from frequent attacks of asthma, required his constant professional assistance; so that it was said, that, one year with another, for the first eleven years of the reign of King William, Radcliffe received more than 600 guineas for his attendance upon his majesty, exclusive of what he received from the great officers of the Court.

These may serve as specimens of his prudence, and the following story, which may be best related in the words of his biographer, Pettis, affords a good example of his humour:—

"It will not be much out of the way to insert a diverting passage between Sir Godfrey Kneller, the king's chief face painter, and the doctor, since it happened near this time; and, though not altogether so advantageous to the doctor's memory as the generality of his sarcastic replies, yet will be of use to bring in a very happy turn of wit from him that speaks the rejoinder to it. The doctor's dwelling-house, as has been said before, was in Bow-street, Covent Garden, whereunto belonged a very convenient garden, that was contiguous to another at the back of it, appertaining to Sir Godfrey, which was extremely curious and inviting, from the many exotic plants, and the variety of flowers and greens which it abounded with. Now, as one wall divided both inclosures, and the doctor had some reason, from his intimacy with the knight, to think he would not give a denial to any reasonable request, so he took the freedom, when he was one day in company with the latter, after extolling his fine parterre and choice collection of herbs, flowers, &c., to desire the liberty of having a door made, for a free intercourse with both gardens, but in such a manner, as should not be inconvenient to either family. Sir Godfrey, who was and is a gentleman of extraordinary courtesy and humanity, very readily gave his consent; but the doctor's servants, instead of being strict observers of the terms of agreement, made such a havoc amongst his hortulanary curiosities, that Sir Godfrey was out of all patience, and found himself obliged, in a very becoming manner, to advertise their master of it, with his desires to him, to admonish them for the forbearance of such insolencies. Yet, notwithstanding this complaint, the grievance continued unredressed, so that the person aggrieved found himself under a necessity of letting him, that ought to make things easy, know, by one of his servants, that he should be obliged to brick up the door; in case of his complaints proving ineffectual. To this, the doctor, who is very often in a choleric temper, and, from the success of his practice, imagined every one under an obligation of hearing with him, returned answer, that Sir Godfrey might even do what he thought fit, in relation to the door, *so that he did but refrain from painting it*; alluding to his employment, than whom none was a more exquisite master of. Thereupon, the footman, after some hesitation in the delivery of his message, and several commands from his master to give it him, word for word, told him as above. 'Did my very good friend, Doctor Radcliffe, say so?' cried Sir Godfrey; 'go you back to him, and, after presenting my service to him, tell him that *I can take anything from him but his physic!*' A reply more biting than true, though allowable from what he had received from the aggressor; so, if the one was at the height of excellence in his unequalled skill in physic, the other had attained to as consummate an experience in the art and mystery of limning."

At the close of the year 1689, when he had gained additional credit and fame, by a cure he had performed upon the Duke of Beaufort, he was called in to consult with the king's physicians, Doctors Blount and Lawrence, and was so successful as to suggest means which speedily so far restored him to health, that he was enabled to join the army in Ireland, and gain the victory of the Boyne.

In 1691, the young Prince William, Duke of Gloucester, son of the Prince and Princess of Denmark, (afterwards queen Anne,) was taken ill of fainting fits, a complaint which had been fatal to several of their children, and his life was despaired of by the physicians. Radcliffe being sent for, first begged that the queen and princess, who should both be present, would rely solely upon him, and allow the use of no other prescriptions but his; and then, by the employment of a few outward and inward applications, restored the little patient to such a state of health, that he never had anything like a delirium from that time till the day of his death.

Queen Mary, who constantly visited the child, was so

pleased with Radcliffe, that she ordered her chamberlain to present him with 1000 guineas. His fame was now so great, that everybody flocked for his advice, and it is recorded that his neighbour, Dr. Gibbons, received 1000*l.* per annum from the overflow of patients who were not able to get admission to the great physician of the day. Hitherto, everything had prospered with him; but in the year 1692, his fortune was chequered with a considerable loss. Among other acquaintances, he had contracted a considerable familiarity with Betterton, the famous tragedian, and at his persuasion was induced to risk 5000*l.* in a venture to the East Indies: the ship sailed and had a favourable passage, when, on her return, she was taken by a Spanish vessel, and all her cargo, valued at 120,000*l.* captured by the enemy. This loss ruined the poor player; but Radcliffe received the disastrous intelligence at the Bull's Head Tavern, in Clare-market, (where he was enjoying himself with several persons of the first rank,) with great composure; desiring his companions not to interrupt the circulation of the glass, "for that he had no more to do but to go up so many pair of stairs to make himself whole again." Nor, it is said, did this pecuniary loss check the exercise of his liberal spirit, for it was in the course of this year that he contributed a considerable sum towards the repairs and embellishment of University college.

His "liberal spirit" is, indeed, one of the pleasantest features of his character. Many instances are recorded of his generous help towards those whose opinions he differed from. During the reign of King James, his friend, Obadiah Walker, of University college, himself a convert to Rome, had used all his endeavours to persuade Radcliffe to follow the same course. Though he rejected his friend's counsels, he continued his friendship: when Walker, after the Revolution, fell into poverty and distress, he allowed him to the day of his death a very handsome competency, and contributed largely to his funeral expenses. He also gave, through the Bishop of Norwich, large sums towards the relief of the non-juring clergy, and in the same year (1704), he settled 50*l.* a year for ever on the Society for the Propagation of the Gospel. Soon after, he sent, through the Bishop of Rochester, 300*l.* for the Episcopal clergy of Scotland, then undergoing great privations, though he had previously argued in favour of posthumous benefactions, with the bishop, who had dwelt much on the satisfaction which well-disposed men feel on seeing the result of their good deeds in their life time. But to return to his medical career.

In the month of December, 1694, Queen Mary was seized with the small-pox, and her sickness assumed the most alarming symptoms. Her majesty's physicians were at their wits' end, and it was decided by the Privy Council to send for Radcliffe, to avert, if possible, the calamity with which the nation was threatened. At first sight of the prescriptions, without having even entered the chamber of the royal patient, he exclaimed with his characteristic rudeness, that her majesty "was a dead woman," for it was impossible to do any good in her case, as no remedies had been given that were so contrary to the nature of the distemper: yet he would endeavour to do all that lay in him to give her some ease. In a short time there were some faint hopes of recovery, but his efforts were ultimately in vain, and the queen died. Some few months after this unhappy event, the doctor, who till then had kept himself in the good graces of the Princess Anne of Denmark, forfeited them, as it is said, owing to his too great addiction to the bottle, and after the following uncourtly manner. Her royal highness, being indisposed, caused him to be sent for; in answer to which he promised to come to St. James's soon after; as he did not, however, make his appearance, a messenger was again despatched after him, to inform him that the princess was extremely ill, and to describe the nature of her indisposition. When Radcliffe heard the symptoms detailed, he swore "that her highness's

distemper was nothing but the vapours, and that she was in as good a state of health as any woman breathing, could she but believe it." No skill or reputation could excuse this rudeness and levity; he was in consequence dismissed from his attendance on the princess, and Dr. Gibbons succeeded him in the care of her health. His credit with the king remained, notwithstanding undiminished, of which a splendid proof was given in the following year, by his being sent for to go abroad to attend the Earl of Albemarle, a great favourite of his majesty, and who had a considerable command in the army during the campaign which ended with the taking of Namur. Radcliffe remained in the camp a week only, was successful in the treatment of his patient, and received from King William 1200*l.*; from Lord Albemarle 400 guineas and a diamond ring; he was offered also the dignity of a baronet, which he begged to decline, on the plea of having no children to inherit the title. In 1697, after the king's return from Loo, having ratified the peace of Ryewick, his majesty found himself much indisposed at his palace at Kensington, and the advice of Radcliffe was had recourse to. The symptoms of the disease were dropsical, and, though not treated very properly by the other physicians, nor considered by them as threatening any immediate danger, were looked upon by him as of a formidable nature. The interview which Radcliffe had with his majesty is described by Pettis in the following words: "The king, when the doctor was admitted, was reading Sir Roger L'Estrange's new version of *Æsop's Fables*, and told him, that he had once more sent for him to try the effects of his great skill, notwithstanding he had been told by his body physicians, who were not sensible of his inward decay, that he might yet live many years, and would very speedily recover." Upon which the doctor, having put some interrogations to the king, very readily asked leave to turn to a fable in the book before him, which would let the king know how he had been treated, and read it to him in these words:—

"Pray, sir, how do you find yourself? says the doctor to his patient. Why, truly, says the patient, I have had a most violent sweat. Oh! the best sign in the world, quoth the doctor. And then a little while after he is at it again, with a, Pray how do you find your body? Alas! says the other, I have just now such a terrible fit of horror and shaking upon me! Why, this is all as it should be, says the physician, it shows a mighty strength of nature. And then he comes over him the third time with the same question again: Why, I am all swelled, says t'other, as if I had a dropsy. Best of all, quoth the doctor, and goes his way. Soon after this, comes one of the sick man's friends to him, with the same question, how he felt himself? Why, truly, so well, says he, that I am e'en ready to die of I know not how many good signs and tokens."

"May it please your majesty, yours and the sick man's case is very much the same," cries Radcliffe; "you are buoyed up with hopes that your malady will soon be driven away, by persons that are not apprised of means to do it, and know not the true cause of your ailment: but I must be plain with you, and tell you, that, in all probability, if your majesty will adhere to my prescriptions, it may be in my power to lengthen out your life for three or four years, but beyond that time nothing in physic can protract it, for the juices of your stomach are all vitiated; your whole mass of blood is corrupted, and your nutriment for the most part turns to water. However, if your majesty will forbear making long visits to the Earl of Bradford, (where the king was wont to drink very hard,) I'll try what can be done to make you live easily, though I cannot venture to say I can make you live longer than I have told you." He then left a receipt behind him, which was so happy in its effects as to enable the king not only to make a progress in the western parts of his kingdom, but to go abroad, and divert himself at his palace at Loo, in Holland.

(To be continued.)

THE FESTIVAL OF ALL-SAINTS' DAY.¹

In the south of Germany, the old and venerable custom of adorning the graves in the burying grounds on the first and second day of November with garlands and lamps, is still kept up. It is an affecting festival which the survivors prepare for their deceased relations and friends. On those days the whole population of the town assemble in the churchyard, and gaze with melancholy recollection, or joyful confidence in the future, on the adorned death-feast, and pray, while the priest, using the requisite forms, draws from the holy well the sacred flood with which he is to sprinkle the graves in order to consecrate them. Death, then garlanded with flowers, becomes a friendly teacher; the lamps and tapers are images of the everlasting light, and the passing from the joys of summer and autumn to the quiet advent time, involves a very peculiar preparation.

This festival is celebrated no where so beautifully as at Munich. On the morning of All-Saints' Day, the families greet each other over the resting-places of those they loved, arranging, adorning, and praying in faithful hope, or weeping in sad remembrance. These hours alone can be devoted to the feelings of the heart, for at noon the gates of the cemetery are opened to the public, who, less interested, though not less penetrated with emotion, wander through the large and well-planted garden.

There are but few signs of mourning to be seen. Light and life reign every where; the loveliest flowers and plants bloom on the graves; cypresses and weeping willows wave and rustle in the breeze; and, if any thing reminds us of the chilliness of death, or the gloom that we dread, it is the lifeless forms of the hired male and female grave-watchers, who stand near the mounds, to tend the lamps and flowers, mechanically repeating their rosary, contemplating sullenly and indifferently the imposing spectacle around them, and longing for the evening, when the reward which has been promised them is to be paid. In the evening these repugnant figures leave the garden, but they take away with them the flowers and lights, and the feast is at an end. The variegated lamps are hung up again in the rooms, and the flowers and plants are taken to the gardeners' hot-houses, to the milliner's shop-counter, or to the boudoir of some lovely maiden.

Such is life!

Speaking of this festival, a story occurs to me. I was once at this death-feast, and had just turned from a mound watered by the tears of a numerous family, to go into the more desolate parts of the grounds, where the watchers are more thinly scattered, and where only individual mourners are to be seen. Suddenly I stood before a friend whom I had not seen for many years. With a pale countenance and hollow eyes, he leaned upon an urn, and he shuddered like a criminal when I addressed him. My greeting was short but sincere; and my next question was,—"What is the matter with you: does your bride sleep here?" He shook his head and said, "A maiden rests here, who, in the bloom of her youth, sank into the grave, swept away by the drunken spirit of the dance. A maiden whom I never knew, and yet a bitter enemy, has robbed me of all my peace. Place yourself beside me on this hillock, and listen,—"

"Many years ago, business led me through this town, at this very time of the year, and I saw the festival that they are celebrating to-day. At that time this grave was newly made, and as abundantly adorned with flowers, as it is now destitute of them. This was natural, for the love and grief of a mother had adorned it with roses and branches, but love and grief soon laid the fond mother by the side of her only daughter. Now, no one cares for the beautiful dead as they did at that time, when all the town spoke of her, and I, a stranger, was curious to see her grave, and was tempted, in remembrance of her early departed charms, to take one of the

roses which bloomed on her place of rest. I stole the flower, and hastened to the gates, hearing it on my heart. There I perceived an inscription, affecting, simple, and touching. It ran thus: 'Respect the property of the dead!' I trembled involuntarily, conscious of my robbery; and the pious belief of my childish years was so strong, that I was on the point of returning the rose to the place whence I had taken it. Oh, that I had done so! but false shame was triumphant, and a species of free-thinking overcame the pure childish emotion. I returned home, indulged myself for some minutes with the rare beauty of the lovely flower, which did not appear to have grown in a hot-house, but in the fields by the Arno. I then placed it carefully in a glass of water, and left the inn to seek a friend.

"The evening passed merrily; I returned to my lodgings late, and quickly yielded myself to sleep, in which jovial toasts and cheerful jests seemed to sport around me. But these pleasant dreams soon disappeared, and softly and awfully the spectacle of the death-festival passed before me as in a magic-lantern; the grave on which I had stood, the field of flowers as though veiled in black, all rose before me, and in my dream I again stole the rose, escaped from the grounds pursued by owls, and, on reaching home again, threw myself exhausted on the bed. Suddenly the door opened, and a lovely form, enveloped in a linen shroud, passed through, glided up to my bed, and I shudderingly recognized it as the form of her whose property I had violated. I trembled with horror. 'Where is my rose?' asked the form with unspeakable sadness, and her features, in spite of her beauty, were anxious and threatening. 'What have I done to thee, that thou shouldst rob me? Is it thus thou honourst the dead? Where is my rose?' Incapable of speaking a word, I stretched out my arm, and pointed to the window where the rose was in water. The figure motioned for me to rise. I was involuntarily, but violently, drawn to the rose, which I seized, and the spirit flew with me through the window, into the cold night air, far over the town, to the cemetery, to her grave. All around was desolate; not a human sound was to be heard; but from all the graves coloured flowers were nodding; lights and torches streamed in sparkling abundance, and from every mound the dead were rising and bathing their heads in the brightness of the consecrated flames, in the fragrance of the flowers, and in the blessed dew that falls at midnight from heaven.

"The maiden's grave alone was dark and forsaken, and no flower blossomed on it.

"At a sign from the shadow, I scratched up the dry earth with my fingers, and planted the rose. Instantly the hill around flamed with the most burning colours, and the stars rocked themselves in the newly-sprung flowers. 'So, it is well,' said the figure, in a hollow voice; 'but now thou art mine!' The hill opened, the grave yawned on me, and the corpse, sinking like a light fluke of snow, drew me irresistibly down with her. The whole weight of the earth rushed upon me. Oppressed by the clods of earth, choked by the embraces of the ghost, I lost all consciousness—and I awoke, and found myself in bed, the bright sun shining full upon me, and with a sigh of relief, I set the past down entirely as a dream. But, as this dream seemed to become more and more impressed on my memory, I rose to convince myself that I had really only dreamt, but, on going to the window to look at my rose, and to breathe its fragrance, it had disappeared. The glass was empty; the window was firmly closed, and the door was bolted. All inquiries after the flower were in vain. No one had seen it, no one had taken it, and I was obliged to conceal my anguish, in order not to be laughed at by the irreligious, or shunned by the religious. But since that time my rest is gone, and from hour to hour I await the irreconcilable enemy, who will take me away to punish me for the violence I practised on her grave."

(1) From the Note Book of a Traveller.

Of course I said everything I could to assuage his melancholy—to banish his fear; but rooted prejudices are not easily taken from the mind. I proposed to him to accompany me to a merry company in vain; he had been to none for years, he said. I wished to carry him to a concert; it disgusted him. At length I recollected that I had been invited to a little party which was to be given that evening by an acquaintance of mine, who some days previously had married a young girl of obscure rank, but honest, pious, and industrious, and who, therefore, appeared likely to make my honest Werner happy. He had frequently shown me a variety of kind offices, and appeared sincerely attached to me.

My friend accompanied me to the frugal repast of these good people, and, at their patriarchal table, at which Werner's aged mother presided, like a household goddess, the mourner enjoyed an hour's peace; but the evil spirit came over him again, and, scarcely bidding the company farewell, he flew to his lodging, again to bury himself with his melancholy.

Werner and his family naturally asked the cause of this mournful frame of mind, and I answered, "It is because it is so mournful, that I would not willingly disturb the joys of this marriage festival by relating its cause;" and, in order to divert all curiosity from the subject, Werner begged his young wife to show me the beautiful bridal garland she had worn at her wedding. She brought out the box, and, with a blush of pleasure, she showed me the ornament, woven of fresh myrtle and artificial orange-blossoms.

Deeply and securely buried among the trembling leaves and stalks, I soon detected a flower unusual in a bridal garland—a rose. Werner smiled, as I pointed it out, and said, "That is a whim of my own. This faded flower, which has been preserved for years, is the foundation of our domestic happiness, the first pledge of our love; and therefore I took it from my pocket-book, and placed it, like a religious relic, in the bridal wreath. It is just five years ago to-day, when my Anna, who was then a poor servant-maid in the inn opposite, entered my shop. I had often seen the charming girl, but had never ventured to say how much I was attached to her. But on that evening she wore in her bosom this rose, almost shaming the blushes on her cheeks; and with this rose I opened my conversation. I spoke with courage and fire, confessed my affection, obtained Anna's in return, and received from her, as a pledge of it, this rose. Heaven be praised! it was a talisman which constantly bound us together, and has united us at last at the altar."

"It is most curious," said I, "as a rose has caused your happiness, so also a rose has caused my friend's misery."

I then related his story, and I remarked the lovely Anna first become red, then pale, and at last she interrupted me—"I recollect your friend now, and I acknowledge, with repentance, that my indiscretion has, perhaps, been the cause of his misfortunes. He lived in our inn; and in his room, which I arranged very late on the evening of All-Saints' Day, I found this magnificent flower, which allured and tempted me so much, that I took it away, convinced that the young gentleman would not think much about a rose which he had plucked the day before. It turned out differently. The landlady questioned us all severely about the lost flower; but could I confess its fate, without at the same time confessing my little theft, and my love to Werner?"

I started up, embraced Werner and Anna, and that very night I brought back my friend, who suddenly saw his anguish fall from him, like scales from the eyes; and, becoming instantly a new man, he thoroughly enjoyed the punch that we drank to the memory of that glorified being, whose grave had certainly caused my friend some unhappy hours, but had also founded the blessed happiness of a whole family.

RAMBLES IN BELGIUM.

No. V.—LOUVAIN AND WATERLOO.

It was good fortune which decided my taking a vigilante to Louvain, as it enabled me to see a much more pleasing part of the country than can be found on the line of railway from Brussels to Mechlin, and so on to Louvain: this latter is also a circuitous route.

These vigilantes are very convenient vehicles, and in appearance are something like the old hackney coaches, and something like the London street cabs, partaking of the nature of both, and yet preserving an individuality of their own. A party of four of us was taken to Louvain, a distance of sixteen miles, for nine francs. The road is much more picturesque the nearer it approaches Tervueren, being well wooded and hilly: not far off a mansion was to be seen of noble dimensions, which the driver said was a present from the Flemish nation to the Prince of Orange, since ascended to the Dutch throne; now, of course, his no longer. Everybody had so bepraised the Hôtel de Ville,—every one had said, when admiring the glorious pile at Brussels, "Oh! this is nothing, compared to the one at Louvain;" all books of travel and works on art were so unanimous in giving it the pre-eminence, and my expectations were so greatly excited, that I must fairly confess, when the driver of the vigilante deposited me beside it, I felt disappointed.

Although distinctly to this day preferring the solid magnificence of the Brussels hall, yet after few pausings, contemplations, looks and re-looks, so to speak, I was able to appreciate the beauties of the building before me. To say that it is profusely decorated from basement to roof affords little assistance to the imagination of the reader. It has three tiers of windows, with a gallery above; the roof is lofty, and has many small windows in it, rising one above another; there are three turrets on each side, with pinnacles, the centre of which are very high. All executed in very elaborate and florid Gothic style. It was erected in the middle of the fifteenth century, and is said to have cost 82,900 guilders. Internally there is not much deserving attention; there are some quaint old pictures and tapestry of no great value. It was pleasing to find that the townspeople appreciated the beauties of their famous "Lion;" for, whilst making some purchases at three shops, the three different vendors, who appeared certain that I was on my travels, were all loud and magniloquent in its praise,—one going so far as to request Monsieur to view it from all points of the compass, and to enter a wood near the town, where it might be viewed in a framework of leaves; it was then so superb that Monsieur would have a more exalted idea than he would be able to attain in any other position. Louvain was full of priests, promenading the streets in every direction: they have an imposing appearance in their long flowing black robes and three-cornered hats, though their gait is not particularly elegant or graceful, or their pace at all conspicuous in its solemnity. There was one of them whose figure was of a commanding height, and whose face was the very reflex of all good humours. I met him subsequently at Liege at the railway.

There are two descriptions of beer brewed in this town, which beverage is drunk in large quantities by the Belgians; it is somewhat difficult to say which of the two is the worst. The commoner sort is called *Peetermans*; the superior, the "*bière blanche*." In this latter wheat is used. The flavour of both sorts is most intolerable: but it would seem, by the accounts given of its sale, to be highly relished by the "*braves Belges*." There is truly no accounting for taste, and if this often quoted apothegm were at all likely to be forgotten, or out of date, a good draught of *Peetermans*, or the "*bière blanche*," would soon revive its memory. Yet,

strange to say, Louvain has high repute for its breweries and its beer; and I question much if Messrs. Barclay and Perkins dare venture a rivalry with Messrs. Renier and Hambrouk in the Low Countries. The cathedral of St. Peter having been especially mentioned by some French friends as possessing some paintings of great merit and value, I entered, prepared fully to admire one of Hans Hemling's works which decorates the altar, and a few others in the side aisles, etc. Here again disappointment succeeded expectation. It is in Bruges where Hemling has acquired his title to artistic glories. In that hospital where he lay sick and penitent may be found his finest productions. Louvain was formerly a place of considerable importance, and afforded a subsistence to many hundreds of weavers. Now how is the whole place altered!—streets almost desolate, houses uninhabited, decay and silence reigning in the once busy mart; its commerce, as compared with by-gone years, reduced to mere nothing; so it is, the palace of one generation becomes the ruin of another: and it has often occurred to me, how fine a subject for romance or epic poem might be furnished from this change in the destinies of the old cities of the world. Flanders could yield too many an illustration for so mournful a theme.

It was in Louvain that an insurrection broke out in 1380 against the Duke of Brabant, which produced consequences of no small moment to England. It induced a large body of weavers to emigrate and settle amongst the English artisans; and this simple circumstance laid the foundation of our woollen trade. My *adieux* to Louvain were made after I had inspected a very well laid out cemetery near the town, and enjoyed some more last views of the Hôtel de Ville, and then another vigilante was at hand to convey me to Waterloo.

It is of course expected of every Englishman to approach this battle plain with a doubly distilled mixture of gallant enthusiasm and patriotic devotion. Now, when we got to Quatre Bras, the wood was all gone; there was scarcely a solitary tree near the place. The forest of Soigné is conspicuous for a number of spruce-looking tall young beech and elm trees. The Chateau of Hougomont is fast losing its identity; new buildings are creeping up all round it; very little remains of its former state. The field where the great action of our time was fought is remarkable for possessing a great sand-hill, on which is deposited in triumphant glory the Belgian Lion,—magnificent trophy truly to the "braves Belges!" Whichever way the eye turns, it is invariably directed to this monstrous absurdity. And this is Waterloo!—really and literally Waterloo!—this the ground where a British hero won his proudest laurels, and where one of the greatest of human comets learnt the use of his heels!!! In vain the guide pointed to this part as the scene of a particular skirmish; and to that as the distinguishing vantage ground of such and such a battalion. In vain; for I could as soon fancy it all to have taken place on Hampstead Heath or Salisbury Plain. Look where I would, that horrid, stupid sand-hill, with its presiding genius, would intrude upon the sight, till I began to wonder why it did not roar. An orchard, with an old, worn out, battered gate, bearing impress of a cannonade, was the only spot I could hit upon as evidence palpable of the scene I had so often heard and read of. So I let the guide wander on and talk till there was every prospect of his telling the same tale ten times over. There was something about the place so utterly destitute of its associations, that no ideality would or could overcome. Corn was ripening and flax was growing all around; and why should it not be so? Why, indeed? But again that most offensive sand-hill—why should that be so? Why obtrude that tasteless monstrosity to scare her Britannic Majesty's lieges? To see the golden ears waving was all very well, symbolical of the happy peace which has survived those fearful scenes of carnage and desolation. But to behold that vile work of Art rising to disturb and destroy

the natural level of the plain is enough to raise the spleen of a Briton born and bred. So disappointed did I feel, that I could not help saying, when I dismissed the guide, that a man might as well pay to be shown the sea in the bay of Trafalgar, as to give his *douceur* for visiting Waterloo as it now is.

ON SOUND AND THE SENSE OF HEARING.

WHEN the reader is informed that all sounds result from vibrations, produced in an elastic body, and propagated through the air to the ear, it may not unnaturally occur to him to ask what is the cause of the different kinds of sound: what, for instance, is the difference between a *noise* and a musical *tone*.

An investigation of this subject has led to the curious conclusion, that, when a body vibrates with considerable rapidity and uniformity, a musical tone is produced; but if the vibrations be unequal among themselves, some being slower than others, the resulting sound is appreciated by the ear, not as a tone, but as a mere noise. When a wheeled carriage is passing over the stones of the street, each projecting stone with which the wheels come in contact receives a blow, and to a certain degree vibrates in consequence; but the stone has so little elasticity, that the resulting vibrations are not so regular and equable as to form a musical tone; nor are the successive percussions of the wheels against different stones so equal-timed or "isochronous" as to yield such a tone. Again, when the teeth of a saw work against a piece of wood, the successive contacts of the teeth with the wood are too unequal in their occurrence for the production of a musical tone. A file, working against a piece of metal, produces a sound approaching more nearly to a tone, partly because the teeth are finer, and because the substance is more perfectly elastic than wood.

Now in order to induce a belief that this isochronism of vibration occurs during the production of a musical tone, we may refer to the action of a common pendulum, or even a ball hung from a hook by a piece of string, and made to oscillate. We shall find that any one such pendulum will perform its oscillations in almost precisely the same length of time, whether the extent of the oscillation be great or small. If the pendulum or the ball have to pass through a larger arc, it moves proportionably quicker, whereby the path is gone over in the same time as a smaller arc. So, in the various musical instruments, the elasticity of the vibrating body is in general so equable, that the rapid vibrations to which we refer succeed each other after equal intervals of time. The parchment of a drum or a tambourine, the string of a violin or harp, the column of air in a flute or horn, the metal of a triangle or cymbals, however they may be excited to action, and however they may differ in quality of tone, all make their vibrations in an isochronous manner, and yield musical tones. The different qualities of the tones thus yielded are attributable partly to the material of which the instrument is made, and partly to the manner in which the vibrations are excited. Although the piano-forte, the harp, the guitar, the mandolin, and the violin, consist essentially of stretched cords, yet it is easy to distinguish the kind of tone belonging to each; and we may notice the following

points in endeavouring to explain the source of the difference: in the piano-forte, the strings are enclosed in a box, and are struck with a soft hammer; in the harp, they are open to the air, attached to a sounding-board at their lower ends, and struck with the fingers; in the guitar, they are likewise struck with the fingers, but have a sounding-board or case parallel with their length; in the mandolin, they have scarcely any sounding-board, and are struck with a quill or plectrum; in the violin, they are vibrated by the friction of a resined bow. In all these cases, the tone is modified in quality by the manner in which the string is vibrated, and by the presence or not of a sounding-board, which, being itself set into vibration, communicates vibrations of a peculiar kind to the air. In wind instruments, and in instruments of percussion, the same remarks apply. If the vibrations are brought about in a particular manner, the resulting tone has a character or quality belonging thereto.

Supposing, then, that any series of sounds, to which we are listening, have that character which we call musical, the next inquiry is, how a difference of pitch or acuteness is brought about. An octave-flute produces sounds of the same quality as a concert-flute, a quality essentially different from those yielded by stringed instruments; but the tones of the two flutes differ greatly in pitch or acuteness, those of the smaller flute being more acute than those of the larger. In all such cases, it is found that the more elevated tones result from a quicker series of vibrations, without relation to the manner in which those vibrations are made. If a string make one hundred vibrations in a second, these vibrations will be of the same kind, and will produce a sound of the same quality as those which are repeated from a similar string, with a rapidity of two hundred in a second; but the sound will differ in pitch or acuteness. As the pendulum of a clock will oscillate more quickly when its effective length is diminished, so will the vibrations of a column of air, a string, a spring, or a metal rod, be increased in rapidity, when the length of the vibrating body is diminished; and it has been found that whenever such a result is produced, the ear (or the mind) recognises the fact in the production of a more acute tone, than when the vibrating body was longer.

If it should be asked, why a rapid series of vibrations produce an acute sound, we can only meet the question by asking another,—why do vibrations produce sound at all? We have been desirous of reducing the inquiry to its simplest form hitherto, in order to explain the dependence of sonorous effects on the vibration of the sonorous body; but there is a point beyond which we cannot go, viz., the connexion between the physical effect and the mental perception, which we have represented by the verbs *to sound* and *to hear*. The ear appears to be an organ constituted in such a manner as to be affected by the vibrations of the air with which it is in contact; but the mental machinery, or the mental process which follows this affection, and which we designate as *perception*, will perhaps never be thoroughly understood. It may, however, be as well, briefly to notice the construction of the ear, and the opinions entertained respecting its action.

Anatomists, after a careful examination of the construction of various animals, have come to the conclusion, that the essential organ of hearing is a nerve or a set of nerves, and that the ear is merely a mechanism for effecting more completely that which could to a slight degree be brought about without it. Many of the lower animals enjoy the faculty of hearing to a limited extent, although unprovided with organs exclusively appropriated to the concentration and transmission of sound. A deaf person can find a slight degree of musical pleasure, by placing his hands on the case of a piano-forte while being played; the vibrations of the instrument impart a tremor to the frame which probably affects the auditory nerve. It is sup-

posed that a tremor, somewhat similar, communicated by the vibrations of the air, supplies the want of actual audition in the lower animals. A writer on this subject has observed:—"It is probable that even the lowest animals provided with a nervous system, are able to perceive the notices thus conveyed of external objects, and turn them to account in the degree necessary for their security and comfort. But to meet the increasing wants, and minister to the multiplied faculties of the more complete animals, various subsidiary parts are found to be added, in something like a regular succession, as we advance upwards in the scale, each lower grade possessing the rudiments of some additional provision more fully developed in the next above, till the organ reaches its greatest amplification in man and the other mammalia. The particular use of many of these subsidiary parts has not yet been explained. We know in general that they must increase the force and vividness of the impression; that they afford indications of its direction, and the means of appreciating minute shades of difference in its kind and degree, and in the frequency of its repetition; that some of them add to the security of the organ without impairing its delicacy; and that others serve to adjust its position, and to adapt it to various changes in the state of the atmosphere."

The external, or visible ear, called the *concha*, or *auricle*, consists of several pieces of elastic cartilage, expanded in a form more or less resembling an ear-trumpet in many animals. In man it serves the purpose of collecting the sonorous vibrations, and directing them into the cavity of the ear. From this passage, or channel, the *meatus auditorius externus*, leads to the *tympanum*, an inner portion of the ear. This passage proceeds at first upwards and forwards, then downwards and backwards, and finally in a horizontal direction, till it ends at the tympanum, or "drum," of the ear. The tympanum is a small hollow bony case, having at the exterior end, or side, a circular opening, covered by a stretched membrane, called the *membrana tympani*, or the membrane of the drum. Into the hollow of this drum, or tympanum, opens the end of a little tube, about two inches in length, called the eustachian tube, the other end of which opens into the pharynx, the cavity at the back of the mouth and nose. By means of this tube it has been supposed that the external air is admitted into the tympanum from the mouth and nose, to equipoise the pressure of the atmosphere on the other side of the membrane of the drum. Across the cavity of the drum, though not in a straight line, is extended a series of little bones, the smallest in the body, the exterior one of which is attached to the membrane just spoken of, while the interior one is attached to a membrane which separates the drum from an inner cavity of the ear, called the labyrinth. This labyrinth consists of a hollow, excavated as it were in the solid bone, and consisting of a middle, irregularly-shaped portion, and of different channels, which proceed from it in various directions. All these passages are lined by a membrane on which the sentient extremity of the auditory nerve is expanded in different shapes; from these it is collected into one trunk, and goes on to join a particular part of the brain, thus completing a communication between the external ear and the sensorium.

To describe the minuteness and exquisite beauty of the several parts of the ear, is a subject for a volume rather than a paragraph; yet, after all the researches which have been made by talented men, the precise office which each part fills in the phenomenon of hearing, is but little understood. Persons have been found who were deficient in some one or other of these parts; birds and small quadrupeds have been purposely deprived of them, for the sake of experiment; and a few valuable facts have thus been ascertained; but nothing like a rationale of the whole process has been obtained. So far as present observations go, it seems probable that

the form of the external ear concentrates the vibrations, and sends them inward through the channel to the membrane of the tympanum; that the membrane is thus set into vibration; that air is admitted to the drum through the eustachian tube, to counteract this pressure; that the chain of little bones communicates those vibrations to the membrane at the inner end of the drum; that this in its turn communicates a tremor to a limpid fluid contained in the cavities of the labyrinth; and lastly, that the nervous tissues in contact with this liquid, convey to the brain those peculiar impressions which we call sound. But how the various gradations and qualities of sound, whether noisy or musical, are thus detected by the ear, we shall probably never know.

It would appear that when the vibrations of a sonorous body vary in rapidity, there is a limit to the perception of them by the human ear. Savart found, from some experiments which he made with a revolving bar, that when only twenty or thirty impulses were given to the air in a second, the effect was scarcely audible; but that, as the rapidity increased, a musical note was produced, which became more and more acute as the number of impulses in a second was increased. On the other hand Dr. Wollaston has shown, that when sounds become extremely acute, in consequence of the rapidity of the vibrations which produce them, the human ear is less and less enabled to perceive them. He found that a friend, whose general hearing was good, could not hear the sound of a shrill organ-pipe; another person could never hear the chirping of the common grasshopper, or *gryllus campestris*; a third was equally insensible to the chirping of a common house-sparrow; while the sounds emitted by the house-cricket and the bat were equally inaudible to others. Wollaston thinks there are animals capable of hearing sounds utterly inaudible to human ears.

As a concluding remark, we may observe, that although there are many difficulties in the way of answering fully the question, what is sound? yet we shall gain a notion of the elements of the subject by remembering, that, in all ordinary instances of sound, there is a body in a state of rapid vibration; which vibrations are communicated to the surrounding air, and by it to the drum of the ear; and that when such vibrations are equable, rapid, and uniform, the ear (or mind) recognises the result as a musical tone, higher or lower according to the rapidity of vibration; whereas, if the vibrations be irregular, the result is merely a noise.

DON'T BE AFRAID.

A Tale.

"I HAVE got good news at last, Aunt," said Agnes Walton, stepping into the little room, called by courtesy a parlour, where Mrs. Lacy was occupied in what she designated "washing up the breakfast things," otherwise, rinsing a few cracked and handleless cups in a basin of dingy-coloured water; whilst her eldest daughter, Charlotte, went through the process of wiping them with a towel, which seemed to have seen more service than soap.

"What is it, Agnes?" cried both mother and daughter in a breath, and their cry was echoed by five little girls in torn shoes and soiled calico, who came rushing in at the sound, and Robert, the only man of the family, lifted his pale and careful-looking face from a borrowed newspaper, to which he devoted the time saved from his breakfast hour, with the quick inquiry, "What is it, Agnes? has your uncle sent you money?"

"Oh no!" said Agnes, in a half-offended tone, "I expect no money from any one; but, you remember Mrs. Carleton, the officer's widow, who used to lodge with us?—she keeps a nice shop in London now, and

knowing her to be a kind good woman, and always friendly to me, because I sewed for her four young children when she was sick, I wrote the other day, just to ask her if she knew of any little situation where one might earn bread in an honest way, for you know there is a large family at home, and no work for any but William. And here," continued the girl, producing an open letter, "she tells me that she wants an assistant in the shop, and, if I go up to London, she will teach me her business, and give me a small salary after the first year."

"Is that all?" muttered Charlotte, bundling by the soiled towel and cracked tea cups, for she knew how neat and clean Agnes and her family kept everything in their house.

"All!" said Agnes, "is it not a great matter, to have the prospect of doing decently for oneself? and, when I am well settled, I will try to find a place for you, Charlotte; wouldn't you like that?"

"Oh dear, no!" cried Charlotte, "I would be afraid to go all alone up to London; one doesn't know what might happen one in such a great bad city."

"Take care of yourself, and trust in Providence," said Agnes; "there are thousands at work in London, younger than either you or I, and, if people can't find work at home, they must go abroad, you know. Wasn't it well that I saved all I earned by plain work for the last twelve months? I have now a pound—whole twenty shillings—and a sixpence besides: that will take me up to Mrs. Carleton decently."

"Sure you would not think of going, Agnes!" said Mrs. Lacy, with eyes as wide as astonishment could make them, "all the way to London in search of a situation, just as if you couldn't live at home; you that has such a nice good brother to work for you, and so many little sisters to look after? Child, child, I wonder what your father and mother would say if they could only hear it, poor souls!"

"My father and mother would say it was well done," said Agnes, "to take some of the burthen off poor William's shoulders: he has wrought for us all long enough; and, though I could do something at home, I can do much better in London; besides, Ellen is now fit to take my place, and Alice, and Mary, and Elizabeth, will soon be growing up too: who knows but I might get them places?—but, good morning, all! for I must go home and get ready my things."

Agnes departed, and Mrs. Lacy and her eldest daughter remarked and marvelled over the affair, with occasional observations from the junior members of the family, who could only understand that their cousin Agnes was going away; but at length, they all agreed, that it was very foolish and very bold of her to take such a step. Mrs. Lacy wound up her concluding censures, with the declaration that Agnes was very bold any way, and Robert, who knew that his hour was expired, took up his well-worn hat, and quitted the room with a more melancholy look than usual.

Agnes Walton was the daughter of a respectable tradesman, living in the small and secluded village of Willowbrook, a little place like an overgrown hamlet, situated on the southern coast of England, on one of those broad and level downs, in which the writer of "the Dairyman's Daughter," "the Negro Servant," and many another tale dear to our early memories, so much delighted; fenced in by high chalk cliffs from the sea, and covered with pasture land and corn, in the midst of which stood the village, on the banks of a broad clear stream fringed with willows, from which the place was named, its house roofs half hidden by green hedgerows and luxuriant orchards.

We have said that Agnes' father was respectable, and the term is appropriate to an honest, industrious man, for such he was; but like too many of his class, William Walton married early, and saved nothing: he made what is called "a love match" with the daughter of a neighbouring and rather wealthy farmer, who might have brought a few hundreds, by way of portion, to a husband

nearer her own station; but as the girl chose differently, the only dowry vouchsafed to her was the indignation and dislike of her family, including her elder sister, who had been but a month before satisfactorily married to Mr. Robert George Lacy, the village attorney, and third cousin to the Squire of Willowbrook hall; for where was there ever an English village without a hall and a squire?

The sisters had been the only girls of their family: born among many boys, in childhood they had dressed their dolls together, and in youth arranged their curls at the same glass, (for farm houses were scarce of mirrors in those days,) but the currents of their wedded years flowed far apart, for the barriers of style and station rose between them. Mrs. Lacy inhabited a house of two stories, kept what in Willowbrook was called a drawing-room, and sported "her one-horse chaise and bit of livery," as the Caudle papers have it; while Mrs. Walton's dwelling-place was a low cottage, apart from the rest of the village, and standing alone under the old willow trees on the very margin of the stream: but it was covered with rose and honey-suckle, had flowers in the front and a neat garden in the rear: all Willowbrook knew that she kept no servant, and the family (for such things will come,) walked to church every Sunday "on their feet like other people," as an observing dame of the neighbourhood was wont to remark.

Such distinctions were sufficient to mark the respective positions of the sisters, particularly as Mr. Lacy was known to be the Squire's man of law. But in two things, at least, they were equal; first, that their children increased and grew like olive plants, if not much faster; and secondly, that they never thought of laying up any provision for their future days: but time, at length, still more equalized the fortunes of the growing branches. Mrs. Walton passed from her rose-covered cottage to a green grave, at the birth of her sixth child, and her poor husband, whose heart still held fast the love of his stealthy wooings, struggled on awhile with the desolation of his home, and followed her within the year, leaving five almost infant girls to the care of the older and only brother, William, a boy still in the years when tops and balls are precious, and marbles have an intrinsic value.

Mrs. Lacy had but little time to mourn the sister from whom fortune had so far estranged her, for the great destroyer entered her own dwelling also, and Mr. Lacy, in the midst of his apparently prosperous business, and village greatness, was suddenly summoned from this world by a fever, leaving his affairs embarrassed to such a degree that the sale of his effects scarcely paid his creditors, and his wife with seven children to provide for, besides her own singularly genteel ideas and rather useless habits: of course, friends and relations assembled to do what they could for the widow, and the result of their combined abilities was, that she and her family were housed in a small house, much like that occupied by the Walton's, though not so neatly kept, with some poor remnants of their former furniture, and the first-born Robert, (for by a curious coincidence of circumstances, Mrs. Lacy's children had amongst them but one boy, and he was the eldest,) was placed as an apprentice with Mr. Selby, a draper, who had lately set up in the village a shop which, like the rod of Aaron, swallowed up all its former establishments, for the like of it had never been seen in Willowbrook.

But the Walton's had no friends to take care of them; for their father had no relations but one married sister, a poor char-woman with a drunken husband, and, having lost her first baby, she took the youngest child to nurse in its place. Their mother's relatives looked coldly on the tradesman's children, and generally recommended the workhouse; but the orphans preferred their old cottage, and the owner (for such deeds of hopeful charity are still known amongst men,) allowed them to remain in it, free of all charges, till time or fortune should enable them to pay. But young William had learned something of his father's trade, and Agnes, who happened to be their eldest girl, could sew a little; Ellen, and Mary, and

Alice picked up their living by all sorts of small industry;—sometimes they went errands, and sometimes they went where people's wits are said to go—"a wool-gathering," like the children of the "Shepherd of Salisbury Plain," for Willowbrook was a pasture district, and sheep will leave wool on the bushes. So the orphan family lived on through many a summer, and many a winter too, for poverty can make out life in the country. At times they received assistance from some kind neighbours, who still remembered old friendship, and their dead parents; but often they had none except that of Providence, who, like the old world's Jupiter, still helps those that help themselves; and at length little Elizabeth came to join their company, for her good aunt finished her washing days, just when the little girl was able to go a wool-gathering with her sisters. But every year added strength to their hands, and means to their resources, for time is the trust of the young. As William grew older, his skill and employment increased, till his praise was in all the parish as a good and trusty tradesman. Agnes was in requisition by all who were fastidious in shirts, caps, or baby linen, and there was a taste for such things even in Willowbrook. Her sisters, one after another, became expert in the use of the needle, and added to the family finances by the practice of every useful art, from "straw plait," up to "Berlin;" and the Walton's were known as a decent, industrious family, who paid their own way, and wanted nothing but work from the world.

How the Lacys lived was for some time a problem to the whole village, for Robert was still in his apprenticeship, and Mrs. Lacy promulgated the fact, that "her girls, poor things! could do nothing for themselves," and nothing certainly they did that could bring in a farthing. Her own time, as well as that of her eldest daughter, was occupied by perpetually washing and patching up the remains of old finery, for the purpose of enabling that young lady to appear to advantage. As for the junior branches of the family, they were very seldom visible.

In the days of their mamma's glory, they had all, including the baby, (for, of course, there was one,) been daily exhibited on the village street, under the conduct of a very loud-speaking nurse, who drew the attention of both strangers and natives to the magnificence of their frocks, hats, and feathers. But those days were past, with all their grandeur, and Mrs. Lacy's chief care was now to keep them as much out of sight as possible, and fast shut up in the cottage, lest, as she expressed it, "they might learn bad habits, by associating with the children of common people;" for, Reader, the exclusive spirit hath its temples every where. To be sure, this arrangement did not much improve either the health or tempers of her little girls; but what are such considerations to prudent and determined mammas, compared with the indulgence of their own caprices or vanity! however, the grand mystery of Willowbrook was at length solved, for it became generally known that the family received an allowance in a quiet way from the parish, and, besides, sundry contributions from all who came within the pale of relationship, out of which consolidated fund Mrs. Lacy occasionally purchased white pinafores and gay-coloured calicoes, destined to be washed every second day; for the most merciless wearers of her household supplied their wants in the provision line, and drank tea at least three times per diem.

But the years that passed over the Lacy's, in paltry dependence, petty jealousies, bitter disputes, and all the mean miseries of an idle community, shut up in their poverty both of mind and purse, brought changes, though not bright ones, to Robert; he was naturally of a gentle and patient disposition, and his mother had so earnestly impressed upon him, that he was to be the staff of her age, and the support of his sisters, that Robert seemed to regard himself as a staff in good earnest, on which the weight of the whole family must lean.

Doubtless there was ballast enough in that connexion

to keep his youth steady; for, from a frank and handsome boy, he grew up a sober and very subdued young man, anxious to succeed, and extremely attentive to business: such boys are always sure to please their employers; and, as soon as Robert's apprenticeship expired, Mr. Selby engaged him as a shopman, with the usual amount of salary given by country drapers; but, small as that amount was, it would have left poor Robert savings, besides the supply of his own simple wants. However, such was not the destiny of his earnings, for, no sooner did the parish authorities discover that Mrs. Lacy's son was in the receipt of money, than they stopped the supplies; the few relations, whose patience was not already exhausted, also refused to be further taxed, on the same account. And Mrs. Lacy and Miss Charlotte, who now stood on the threshold of womanhood, with the deep-rooted consciousness that she was Attorney Lacy's daughter, and therefore could do nothing for her own support, patched and mangled, and drank tea as heretofore accustomed, till one penny of poor Robert's quarter's salary never beheld the succeeding quarter paid: and the good dame spent most of her leisure hours in lamenting that it was not in her power to send her little girls to Miss Green's nice day-school, where deportment and all sorts of fancy work were taught for two shillings a month, and observed to a friend who hinted that girls might learn to read at the charity school, "that Attorney Lacy's daughters could not be seen in such a place: no reading at all was better than that, for she knew those who had lived and married well without much learning, and Charlotte could teach her sisters, any way."

How Miss Charlotte fulfilled the duties of a governess we cannot tell, never having seen the fruits of her instruction; but one thing is certain, that, having a good deal of unoccupied time, the young lady improved her own mind with all the novels she could either buy or borrow, and took a special pleasure in reading the adventures of young noblemen, who were captivated by lovely faces seen through cottage windows; for in the truth of such tales both she and her mamma had an unwavering faith, particularly when they ended with a peal of bells, a bridal procession, and the instantaneous transformation of a young and beautiful peasant girl into a jewelled countess. At times indeed it seemed to have entered into their calculations that one of those marvellously rare events might occur in their own history; but Robert had no such visions; he laboured on with persevering though uncrowned industry: never was there a youth more anxious to learn or less prodigal of his gains, but the burthen was beyond his strength, and in spite of every effort the helpless dependent family continued pinched and poor. Meantime the village matrons observed that he was a discreet and deserving young man, and the girls hinted it was a pity he had so many sisters, for Robert was handsome and good, and the only amusement he sought, after the long toil of his busy day, was an evening visit to the cottage of the Waltons.

Mrs. Lacy had recollected their near relationship ever since her fortune sunk to the same level. The families in consequence became intimate as cousins ought to be, and the Waltons were found very useful in the way of small loans, and other obligations, which were not always returned, though the good dame remarked, in the secrecy of her own heart, "one could not forget they were a mere tradesman's children, and no equals for her family, who had seen better days."

But Robert seemed to think his best hours were spent beside the small open window where Agnes used to work. Young men will fall in love, however far it may be beyond their means, and the girls of the neighbourhood, always keen in such matters, could tell how his eye followed her light active figure, when his step was limited by the shop threshold, as she passed on those numberless errands that keep the early rose on the cheek of the young country needlewoman, in spite of

long sittings and late hours. They knew also that he walked to and from church by her side in his well-brushed though rather threadbare coat, for Robert's wardrobe was not extensive; but the sight or mention of a wedding always made him look strangely sad, like one who felt he could not afford to marry.

Some said that Robert was foolish for thinking of a girl so poor as Agnes, and others that Agnes was too wise to think of him; but none remarked that young Master Lently, the tallest of the rector's boarders, (for the good pastor of Willowbrook eked out his limited income by a private seminary,) sat directly opposite her in church, and was sure to bid her good-morrow at every stile in her many walks of necessity.

Master Lently was the son of a London merchant; his father had higher views for him than the counting-house, for an estate and title were the crowning visions of all the old man's commercial speculations.

Frederic, for that was the boy's name, was his only heir, and, being particularly anxious for religious and moral training, he committed his education for some years to his old acquaintance, the peaceful and the easy-tempered Rector of Willowbrook, for the old merchant was firmly convinced that boys could learn no evil in the country.

Master Lently was now eighteen, and talked much of setting out for Cambridge or Oxford, but still he did not go, and Agnes encountered him by the green lanes and hedge-rows oftener than usual. From frequent meetings she had formed a sort of acquaintance with the young gentleman, just sufficient to answer his good morning, and remark on the state of the weather; and, if her smile was more brief and bright than that bestowed on her sober and paternal cousin, Agnes knew too well the barriers that rose between their stations, and never permitted them to be passed, though Lently was said to be the best-natured and handsomest boy in the parish. But she was already sixteen, her young sisters were growing up around her, and all their arts could only keep want out of the cottage, besides, work would fail at times among so many hands, and, though William's earnings were on the increase, he called himself a man now, and cast long looks on Rose White, the blacksmith's eldest daughter. Agnes saw this, and had for some time contemplated resigning her office of chief needlewoman of Willowbrook, to her next sister, Ellen, who was now fully competent to fill it; but the prudent take no steps without making sure of their ground, and she accordingly consulted Mrs. Carleton.

That lady was, as Agnes had said, an officer's widow, whom disease had overtaken in her journey to London, where she intended to join her relations; her route lay through Willowbrook, and, as her funds were low, she found accommodations suited to them in the neat cottage of the Waltons, who practised a sort of subletting with the better part of their dwelling, in order to discharge their obligations to the kind owner who had spared their weaker days.

Mrs. Carleton was one of those who believe the world owes us all a living, and are determined to recover the debt. Her relations were people of business, and with their assistance she opened a handsome retail shop, in one of the quiet but respectable streets of the capital. Well might Agnes rejoice over her letter, for it was the return of "bread cast upon the waters," with the memory of many a kind and careful deed done to the sickly woman and her orphan children. Such things will come back; but blessed are their goings forth even when they never return.

Short and hasty were the young girl's preparations, for Mrs. Carleton had said, the sooner she came the better; but the Lacy's were in still greater haste discommodating the news, for news were scarce in Willowbrook, and therefore highly valued. All the village wished well to Agnes, but some joined in Mrs. Lacy's opinion that "she was very bold," and many wondered with Charlotte that she wasn't afraid. But another morn-

ing, at a still earlier hour, found her come to take leave of the Lacy's. She had got the farewells and good wishes of all Willowbrook, the rector and his pupils included; and Frederick Lently was out unusually early that morning, walking backwards and forwards in front of "The Golden Deer," where the southern stage stopped, on its way to London. Agnes had taken an outside seat, but the good people of Willowbrook thought that Frederick expected his father; however that might be, Agnes Walton made her parting arrangements; she gave her brother William a watchguard for himself, and a "Billen bag" for Rose, bestowed upon Ellen her cheap workbox with all its well-worn appurtenances, kissed all her little sisters, and promised to look out for places for them in London; and—Readers, they were not afraid—took solemn farewell of all the Lacy's, who were assembled in the parlour, and crying on the occasion; only Robert, for he stood at the door ready and determined to see her to the coach, which now came thundering on with all the temporary stir and tumult which a passing stage can create in the street of a quiet village: and, after many prayers not to think of going all alone, from her weeping Charlotte, mingled with the mother's strong recommendations to just "come straight back to her brother if she found London in the least disagreeable," Agnes wiped her eyes, slipped her arm in that of Robert, who drew it kindly in with "God bless and prosper you, Agnes; I know you'll come to something yet, and get some great match in London, but I'll never forget you," said the young shopman, as he helped her up to her outside place, about which Frederic Lently was marvellously busy, but all the world knew that he was good natured. "Thank you, Mr. Lently. Cousin, farewell!" said Agnes; and away drove the southern stage, in all the glory and importance of being the coach to London, for railways had never risen on the dreams of Willowbrook.

(To be continued.)

THE PASSAGE OF THE SPLÜGEN.

A FRAGMENT.

No person can pass from Milan to Lecco without being struck with the singular beauty of the scenery, increasing at each step in variety of feature and in richness of landscape. The hills, gently undulating, are clothed with trees of the richest verdure, from which vines hang in a succession of festoons, or are trained as roofed terraces, among which cottages and villas of the most dazzling whiteness sparkle in their softened outlines. A higher range of grey rock, on the crags of which many an ancient ruin frowns on the peaceful scene beneath, rises in the middle distance, preparing the eye by a rising and natural gradation for the stupendous forms and snowy crests of the distant Alps. The Adda, winding in its course through the narrowd vallies, gives additional life to the scene, now rich and bright in pastoral beauty, but still recollected as one of rapine and horror while occupied by the French army during its Italian campaign.

The writer of this little sketch performed this journey on a splendid evening of last summer, and it will be long, sufferer even as he was from acute illness, before the recollection of that gorgeous sunset, and the calm repose of that hour, will be effaced from his memory. Imperceptibly night drew on, but there was no darkness, for hardly had the Alps to the west lost the bright pink tinge of the setting sun, than those to the east were lit up by the brilliancy of the moon at its full, throwing a long flood of dancing light on the ripple of the Adda. He hardly regretted the circumstance, though in his then helpless state the position promised discomfort, if not danger, but the motion of the carriage became so insupportable, that he was compelled to alight, and to allow the vehicle to continue its course, while he feebly followed it at intervals, as

the freshness of the air, and the repose of nature, acting on the mind gave impetus to his powers. He sat down from time to time on the bank of the river, and rested against the mulberry-trees on its border, an object of silent curiosity and inspection to the patrols, and little caring as to the hour of his arrival at Lecco; but sympathy for his condition and alarm for his safety brought people from the town to his assistance. They had been alarmed by the report of the driver of the carriage, and, as they said, humanity would not allow them to leave a sick man on the road exposed to the violence of the storm which they were assured was approaching; nor were they mistaken, for shortly after they reached Lecco, lightning and distant thunder announced its vicinity. Soon the rain fell, and continued to fall in torrents for five hours, amidst lightning that lit up the surrounding mountains with a lurid glare, and peals of thunder, which boomed and echoed among them in a continuous roll.

The morning broke fine and cloudless, and nature was bright and fresh from the effects of the storm. The traveller mustered his energies, and engaged a little carriage to take him to Varenna, a small town on lake Como, where he proposed to join the steamboat, and to proceed in it to the end of the lake. Varenna has nothing to recommend it but its position and scenery. The church, and here and there a white building, alone distinguish it from the rock of which it otherwise seems to form a part, and which is fringed with olive and lemon trees, and cypresses of enormous growth and towering height.

Anticipating the appearance of the steamer, the traveller embarked in a small boat in order to enjoy uninterruptedly the beauty of the panorama, the green waters of the lake, the sloping hills, densely wooded with oak and chestnut-trees to their summit, and studded with innumerable villas and hamlets, and the towering Alps in the back ground, beneath whose snowy tops wreaths of cloud and vapour wind slowly along, like mysterious spirits in those inaccessible regions; but a strong gale, rushing through a ravine, accompanied with mist and rain, so agitated the waters, that the boatmen were alarmed and turned to gain the shore; he, however, compelled them to bring the head of the boat to the wind and to await the steamer. Resolution prevailed and the point was gained, but at the expense of a complete soaking to himself and luggage.

The storm soon passed, and again all was sunshine and beauty, and in less than two hours the steamer was moored along side the rude quay at Colico, a little rough spot at the navigable extremity of the lake. Here difficulties seemed to increase, for the place boasted but of one carriage, which was already engaged, and the diligence only passed through at midnight, so as to reach Chiavenna at six in the morning, in order to have the advantage of daylight to ascend the pass of the Splügen, and to get clear of the defile of the Via Mala. The request to be permitted to join in the solitary carriage was courteously acceded to, the driver having stipulated to take the party with whom the traveller was now associated, to Chiavenna at all risks, by boat or otherwise, if the report of a bridge on the road having been washed away should prove correct. For about two hours every thing progressed favourably, and the party were congratulating themselves on the storm of the previous evening, which had brought the mountain-torrents and waterfalls into full activity, some dashing madly through the gullies, and others either falling in a sheer stream from a precipitous height, or winding gently down the side of the mountains like silver threads, when suddenly the carriage came to a dead stop.

Here the work of devastation had begun, for an inconsiderable stream, swollen by the sudden and vast addition to its waters, and boiling furiously along, sweeping away trees and vineyards in its course, had covered the once cultivated surface with stones and rocks,

which, carried onwards by the impetuosity of the waters, had torn away the bridge, and had deposited themselves like a foaming barrier, which it was impossible to ford.

The cunning Italian, foiled in his attempt at imposition, turned sulkily round and drove off; but a boat was soon luckily procured, in which the party were conveyed to the little hamlet of Riva. On their course they perceived that two other bridges had been equally demolished, and the road elsewhere perfectly obliterated. At Riva no conveyances could be found but a country waggon and a little cart; the latter was appropriated to the luggage, and the former, furnished with some sacks filled with grass, was occupied by the traveller. The course lay through a valley about half a mile wide, mountains rising on either side to the height of three or four thousand feet, and here the scene of destruction was frightful. Immense crags, loosened from the mountains, had toppled down, crushing cottages and bearing every thing headlong in their course, had covered the road and large tracks of land with their débris; and the Splügen river, having burst its banks a little below Chiavenna, although its waters had now subsided into its bed, had swept over the land, leaving a deposit of mud and stones, and prostrate trees, where before all was life and promise; and, as if in mockery of the desolation, or to afford the unhappy owners an idea of where their property had been, a few solitary mulberry-trees had withstood the shock, and reared themselves amidst the ruins of the soil.

At Chiavenna, which stands on the rising ground at the foot of the Alps, and at the very mouth of the Splügen pass, the storm had burst with fearful violence, aggravated in its terrors by night and its uncertainties, and driving the terrified inhabitants to their churches for prayer and mercy. Happily its fury abated before positive destruction befall them, for the waters had already touched the crown of the arch of the bridge, and any additional rise would have burst them, and have spread the flood through the town; for the channel, being in a deep rocky gully, through which, even in its most quiet moods, the stream foams and tumbles with headlong impetuosity, was already full to its brink. In one hour the water subsided six feet, and by morning they were but little above their usual level: the town was saved, but its property in land was destroyed.

The travellers here engaged a carriage to take them over the Splügen, and by the Via Mala to Chur. The toilsome ascent occupied eight hours, the road occasionally passing over a natural slope in the mountains, and sometimes either along a shelf cut in the rocks themselves, or working in a zig-zag direction, where a direct progress is rendered impossible by the nature of the ground. It is a triumph of engineering skill, and as safe as such a hazardous undertaking can be; but there are spots where a few spare inches, and a rickety wooden fence, alone intervene between the carriage and the yawning precipice beneath. In no case is the valley at its foot more than a quarter of a mile wide, and is narrower by degrees till it is finally arrested by a wall of rock. A few scattered cottages here and there in that hollow, and along the road, tell of a scanty population, afflicted with goitre, and very—very poor.

It is curious to notice the gradual change and succession of vegetation in the ascent; vines, oaks, and chestnut trees, are soon left behind, and corn and maize give place to potatoes, and a scanty produce of barley on little patches of land here and there to be found; higher up, hay is cut six weeks later than in the plains, and at last vegetation of all kinds is stunted, and becomes little more than an effort. On the very summit of the pass, a wretched squad of men in the Austrian uniform reside, performing the double duty of police and custom-house officers, always cold, and rarely passing a day without rain or snow, which latter covers the hill sides throughout the year.

The utmost ingenuity has been displayed through the whole pass in forming the road, (an operation of only

three years,) along almost inaccessible tracts, in boring through rocks, and in avoiding the course of torrents, which discharge volumes of water, and fall in a sheer and uninterrupted line many hundreds of feet, adding grandeur to the scene, and depriving it of the feeling of weariness and satiety. At particular exposures, where snow-drifts would fill up and bar the way, covered passages of great length are erected, but still a snow storm must be fraught with the greatest danger to travellers, where a false step, or a slip of the horse, would hurl them to destruction.

The descent to the village of Splügen, on the Swiss side, is carried in an unbroken zig-zag direction down the side of the mountain, purple with a species of Azalea, and occupies less than an hour. In this valley the Rhine, as a mere brook of a few feet wide, struggles onwards, increasing however somewhat in width, and considerably in power, as it foams and works its way in falls and torrents through the precipitous and inaccessible gullies it has worn for itself at the base of the mountains through which the Via Mala runs. For miles this road, which would be more appropriately called *Periculpna*, is bounded on one side by the mountain rock, out of which it is cut, and on the other by a fearful precipice, against which a miserable wooden paling is the only protection; and, simply with the precaution of a skidded wheel, the drivers trot their horses along, and turn them round corners with the indifference of habit.

Accidents rarely occur, but a frightful one awaited the travellers. At a point where the road had slipped, leaving for some distance a bare passage for a carriage, and without any barrier or protection against danger and the depth beneath, one of the party, a Pole, insisting on the reckless folly of remaining in the carriage exposed to such fatal risk, got out with his wife, begging his companions to follow his example, and compelling the postilion to dismount and to lead his horses. A few seconds had barely elapsed before the near report of a gun alarmed the horses;—they swerved, and the wheels of the carriage trembled on the brink;—the ground crumbled beneath them, and the body of the carriage, inclining to the angle thus formed, overbalanced itself, hanging for one instant by a vigorous effort of the horses;—it was but an instant, for, falling on its side, it slid and rolled down the few feet of bank on the top of the rock, dragging the struggling horses with it;—they plunged, and made frantic efforts to maintain their ground; but the weight of the carriage, and the impetus given to it by this fall were beyond their power. It was terrible to see their agony and convulsive struggles as they were being dragged downwards; and when the carriage disappeared over the verge of the precipice, and their fate was inevitable, one animal, as, with the supernatural strength of despair, clung for a second to the brink with its fore feet, and then, falling backwards, uttered a shriek, which was beyond description appalling. A crash, and a dull heavy sound borne upwards, announced the catastrophe to the horror-stricken party.

When reason returned, and a sense of their providential escape had been as far expressed as the agonizing excitement of the moment would admit of, (a full and due acknowledgement was not omitted at an early time and an appropriate place,) the travellers bent over the chasm, a depth of several hundred feet, through which the Rhine boils furiously along, and where no human foot can gain access, and there, in a confused and mangled heap, among rocks and water-riven fragments of trees, lay the carcasses of the horses, and such a portion of the carriage as had not been swept into the stream, never to be recovered; a loss, as regarded the luggage, of great moment, particularly to the unfortunate Pole, who lost his all; but the look of joy and thankfulness for their escape, which passed between him and his young wife, as she clung to him for support, showed how little they considered the wreck of their property in comparison to the mercy which had spared them.—E. P. T.

A MISTAKEN VOCATION.

CHRISTIAN URBAN, first alto of the Royal Academy of Music, expired at Paris last week. He was a consummate musician, and highly esteemed in the musical world. Short, ill-shaped, invariably wearing a sky-blue coat, and dining every day at the same table at the Café Anglais, Urban was well known for his originality. But what, above all, distinguished him was an extreme devotion, the minute practices of which he scrupulously followed. He went to mass every day of the week, and on Sundays attended every service. At night he brought with him to the Opera orchestral books, which he read with unctious whenever he was permitted to quit his bow for a moment. You will ask why so devout an artist had engaged at the Opera. He deplored it, but had been obliged to enter the band. Urban had at first devoted his talents to sacred music, but it had not yielded him enough to live upon, and necessity had thrown him into the dramatic world a theatrical musician. All the resources of his mind were employed in reconciling his ideas with the exigencies of his profession. Whilst accompanying with his violin the song and the dance, he had remained a complete stranger to the spectacle, and to its pomp and fascinating attractions. He had made it a rule to keep his head constantly bent on his chest, and his eyes lowered on his music or prayer-book. On no account would he have infringed the duty he had imposed on himself, for the slightest infraction would have been to him an enormous sin. Never did his eyes venture across the proscenium; never did he see the end of the foot, or the lower part of the leg of a dancer, even when she executed her liveliest *pirouettes* or most celestial *entrechats*. He had a holy horror of such abominations. We do not exaggerate; it is literally true that Christian Urban was many years in the Opera orchestra without ever having seen the stage. He was as unacquainted with the *cantatrices* as with the *danceuses*. One day, in a drawing-room, he met a young and pretty woman, who addressed him as a person whom one often sees, and complimented him on his talents in flattering terms. "Who is that lady?" asked Urban. "What, don't you know her?" replied the master of the house. "I have never seen her." "Impossible! look at her well." "In vain do I look at her," reiterated Urban: "I assure you that I have never seen her before." He told the truth; and it was necessary to name Madame Dorus, whom he actually saw for the first time, although he had heard her sing for the last ten years. Urban knew no faces on the Opera stage, and knew as little of the plays as of the performers. He carefully avoided paying the least attention to those works of Satan; and the pious meditations into which he was plunged prevented his hearing the words of the lyric drama. Several modern works have exhibited on the stage the ceremonies and pomp of the Church. Urban considered it a profanation, and shuddered when he heard the chorus utter Church music. One evening, whilst a procession moved across the stage, he was seen to kneel in the orchestra, cross himself, and pray with joined hands, as if he had been at Notre Dame. At the moment death struck him, Urban was about to retire on a pension, and devote himself to monastic life, which promised him unmingled felicity. He has died, leaving the reputation of a very intelligent man, who, during twenty-five years never missed a single performance at the Opera, and never saw *Guillaume Tell*, *Robert le Diable*, the *Huguenots*, the *Juive*, *Sylphide*, nor *Giselle*—of a musician of the Opera band who was faithfully at his post every night during those twenty-five years, and who, though provided with excellent eyes, never saw Mademoiselle Falcon, Nourrit, Taglioni, Madame Stoltz, Duprez, Carlotta Grisi, or any other of the gods and goddesses of either song or ballet.—*Paris paper.*

Miscellaneous.

THOUGHTS ON AN ENGLISH LANDSCAPE.

TAKE the case of a common English landscape;—green meadows with fat cattle; canals, or navigable rivers; well-fenced, well-cultivated fields; neat, clean, scattered cottages; humble antique church, with churchyard elms; and crossing hedge-rows, all seen under bright skies, and in good weather: there is much beauty, as every one will acknowledge, in such a scene. But in what does the beauty consist? Not, certainly, in the mere mixture of colours and forms; for colours more pleasing, and lines more graceful, (according to any theory of grace that may be preferred,) might be spread upon a board, or a painter's pallet, without engaging the eye to a second glance, or raising the least emotion in the mind; but in the picture of human happiness, that is presented to our imaginations and affections,—and in the visible and unequivocal signs of comfort, and cheerful and peaceful enjoyment,—and of that secure and successful industry that insures its continuance,—and of the piety by which it is exalted,—and of the simplicity by which it is contrasted with the guilt and the fever of a city life,—in the images of health and temperance and plenty, which it exhibits to every eye,—and in the glimpses which it affords to warmer imaginations, of those primitive or fabulous times, when man was uncorrupted by luxury and ambition; and of those humble retreats on which we still delight to imagine that love and philosophy may find an unpolluted asylum.—*Lord Jeffrey.*

SOME Scotch officers were coasting along the shores of the Mediterranean in a felucca; when a woman's voice came warbling on their ears from the bosom of a grove; the air was that lovely, simple, and touching melody of their native land, *The Broom of the Cowdenknowes*. The associations it awakened were such as to make every chord of their manly hearts vibrate with emotion, and they wept. They landed in quest of the songstress, when, to their surprise, they discovered an old Scottish woman, seated at her cottage door, twirling her distaff, and lightening her task with these long-cherished strains of her youth. She was the widow of a soldier who had been killed in battle, and she had been thrown by the tide of accident into the spot where the gentlemen found her. Their grateful feelings prompted them to offer to convey her to her native country, in return for the delight they had experienced from the pleasurable associations with home which her notes had awakened. But, alas! all her friends were dead,—her native country was no longer her country,—she was, as it were, rooted in the soil where she now vegetated, and, perhaps, she enjoyed her indulgence in those visionary visitations to the scenes of her youth which the singing of its ballads procured for her, more than she could have done the really visiting her native land.

“My servant has a very good place of it, Sir. Why, besides her board and lodging, she has all my left-off clothes.”

ACCOUNT OF THE GREAT FLOOD AT DRESDEN, IN THE YEAR 1845.

[The following vivid description, embodying the personal experience of a native of Dresden, during the calamity referred to, has been communicated to one of the contributors to this Magazine, and now appears in print for the first time.]

THE year 1845 has been, and ever will be, especially memorable to the dwellers on the banks of the Elbe, on account of the high floods which, at the commencement of spring, overspread vast tracts of country, and caused much misery and loss of life, with the desolation of many a smiling valley and peaceful habitation. In no part of their course were these floods more terrific, or more awfully grand, than in the lovely valley of Dresden; where, however, they were happily less destructive than in some other parts of their wild career.

That you may understand my description the better, let me recall to your recollection the situation of Dresden and its environs with respect to the river Elbe. From Pirna, where the river breaks forth from the rocky walls which fetter its course all the way through the Saxon and Bohemian Switzerland, it rolls its waters along a wide open valley, which stretches in a north-westerly direction, nearly as far down as Meissen, a distance of about four German miles. At first, the river seems to prefer the vine-clad hills on its right bank to the cultivated fields and gardens on its left; but, about the middle of the valley, it appears to take a sudden fancy to the left side, and crosses over to it in an oblique direction. Midway on this oblique line stands the attractive little capital of Saxony, being situated in a plain, not much above the level of the river, but soon rising gently from it on either side. Thus portions of *Neustadt* (the New Town), which is on the right bank of the river, and portions of *Altstadt*, and *Friedrichstadt* (Old Town, and Frederic's Town), on the left bank, are comprised in the low-lying district close upon the Elbe, while the adjacent rising grounds are occupied by the chief part of the town. Facing the river on the Altstadt side, is the Brühlische Terrace, one of the great attractions of Dresden. This formed part of the ancient fortifications, and consists of bastions and high walls, rising nobly from the stream, whose waters vainly dash and murmur against its strong foundations. This terrace extends about eight hundred feet, and, at its western end, a handsome flight of steps leads down to the fine old bridge, overarched the river, and forming the only solid means of communication between the two chief portions of the town, Alt and Neustadt. Below the bridge, on both banks, are landing-places and wharfs for the goods brought up and down the river in boats. Farther down, on the left side, extends a low but lovely meadow ground, interspersed with avenues of lime-trees, called the *gehäge* (preserves), which is embraced by a large circuit of the river towards the north. Shoals of pebbles and sand, between the *gehäge* and the wharfs, indicate the mouth of a small tributary of the Elbe, called the *Weisseritz*, emerging from a rocky glen among the south-western hills. This little stream separates *Friedrichstadt*, the "west end" of Dresden, from *Altstadt*, the easterly portion. At the same spot also terminates a channel of the *Weisseritz*, called the *Mühlgraben*, or the Mill-stream, after having run through the western suburbs of Altstadt. If you bear these several particulars in

mind, you will the better understand the details of the calamity I am about to describe.

It cannot be forgotten that the chief feature in that remarkable winter was the enormous fall of snow in many of the continental countries, and the long continuance of that fleecy mantle, even to a period far beyond that which has been fixed on as the commencement of spring. Such masses of snow were drifted together, that, in the glens and ravines of the Saxon-Switzerland, as well as in the Silesian and Bohemian mountains, it lay to the depth of from twenty to thirty feet, and upwards. In the upper districts of the Saxon Erz-mountains (all along the Bohemian frontier left of the Elbe) it completely stopped up the roads, which had to be cleared at immense cost and labour. The cottages, in the highest parts of these mountains, were for weeks immersed in the downy billows to the very chimney-tops, and the inmates had literally to cut their passage out like miners.

For the benefit of these poor people, a pamphlet, with descriptive woodcuts, was offered for sale; and though in the latter the truth was somewhat overstepped, and an exaggerated picture was given of the wild wintry scenes of these desolate tracts, yet a better idea was given of the sad reality than could have been conveyed by words.

In the same way all Bohemia—from the mountain-tops, encircling this fine country, down to the bed of the Elbe, which receives their numerous streams—was loaded with the same dense wintry garment. From the end of February one thick layer of snow was buried by another and heavier one; and now, even over the minds of the least concerned persons, the secret fear of a dangerous *eisgang* began to creep. This apprehension was more than confirmed by reference to the chronicles of past centuries, which showed that a similar state of weather had always proved fatal in its consequences to the districts bordering on the rivers, especially the Elbe. To meet the impending evil, government now began to take vigorous measures for the security of life and property. At different points along the river, officials were stationed to warn those of the inhabitants most exposed to danger, and to arrange and direct the proper measures of safety by word and action, causing families to retreat in time, with all their moveables, to places of refuge prepared for them. To these wise precautions it is chiefly to be attributed that the loss of human life, and the destruction of property, were so small, compared with the great extent of the calamity. At proper distances pieces of ordnance were stationed, to announce, with the alacrity of thunder, the breaking up of the ice at any point, from the Bohemian down to the Russian frontiers. Amidst these apprehensions and preparations holy Easter had drawn near, and at last appeared, but with it no sign of genial spring, not as Göthe so beautifully has it:—

"Vom Eise befreit sind Strom und Bäche
Durch des Frühlings holden, belebenden Blick;
Im Thale grünet Hoffnung-Glück;
Der alte Winter, in seiner Schwäche,
Zog sich in rauhe Berge zurück." (2)

GÖTHE.—Faust.

Raging storms came on, accompanied by thickly whirling showers of snow, now and then changing into drizzling rain. Mists and heavy clouds at other times obscured the sun, the thermometer still keeping the freezing point. On the first day of the Easter holidays the river was crowded with skaters, sliders, and sledging parties, and a fair was even talked of, as likely to be shortly established on the frozen stream. A friend of mine, who had long been confined to his room by illness, had set his mind on a skating expedition on the

(1) The general breaking up of the ice is thus denominated in Germany.

(2) Rivers and brooks are liberated from ice by the gentle, vivifying glance of Spring; the joy of hope is verdant in the valleys; old Winter in his weakness withdraws to desolate mountains.

second Easter holyday; and he was enabled to perform it, although under very unfavourable circumstances. For it was on that day early in the morning that the weather changed decidedly, and earth, air, and sky indicated that the last day of surly winter was at hand. The streaming rain, however, was, for nearly the whole of this and the following day, quite unavailing over the thick masses of snow, which imbibed it like thousands of sponges; and it was not until a warm southerly gale began to breathe over the vast expanse that the solid mass began to dissolve by degrees into its original form. No sooner had this melting commenced, than torrents of water came pouring down the roofs, rushing from every corner and recess of houses, and soon turning streets and squares into lakes and pools of water, from which bubbling rivulets ran out in every direction. The sewers were wholly insufficient to swallow the hundreds of small torrents, and indeed soon became choked up.

A strange sight it was when at last the tiles and slates on the roofs of houses and churches re-appeared! Not so quickly were the pavement and ground restored to view. With pickaxes, spades, and every kind of breaking implement, they had to be freed from their burden, and heavy cart-loads of icy matter were constantly moving towards the river, and crowds of workmen were busy all over the town making, at least, the foot-ways passable. Out of town all remained apparently unmoved and stationary. The highways seemed, as it were, *Macadamized* with compact snow, wedged together into an icy substance. Only the tops of the most prominent hills were peeping forth their melancholy dark heads, looking over the white waste, now changing by degrees into a muddy, greyish coloured dress. But the smaller rivers, swelled by the incessant rains and melting snows, now began to uplift and break their icy crust. The Weisseritz and Bräueritz-river in the immediate neighbourhood of Dresden, the Lockwitz-Bach, and several others, soon succeeded in throwing off the fetters which had chained them in such a long bondage. The harmless manner in which this was effected seemed to many persons a good omen respecting the Elbe Eisgang; but, alas! this proved a mere delusion, very soon to be overthrown. Towards the evening of Mary (Lady) day the thaw became rapid, and here and there the fields on the hill-sides were laid bare; several instances of little avalanches likewise occurred in the hilly districts of the surrounding country. As a remarkable phenomenon, it was observed that near the lovely village of Kreische, nine miles distant from Dresden, in the afternoon of the said day, the whole mass of snow covering one side of the hills was suddenly lifted up, and tumbled down with a crashing noise. This was owing to the numerous little springs which stud this slope, and of which there are great numbers in the hilly districts generally. Rumours from the Bohemian frontier now asserted that the breaking of the ice was about to take place. To numbers of people this was a cause of anxiety and watchfulness, while to others it merely served as a zest to their curiosity and love of sight-seeing. Every ear was now intent for the sound of cannon, the signal that the ice was moving. Yet the whole of Wednesday passed without the expected sign, and not a few grew tired and impatient of watching for it.

It was not until late in the afternoon of Thursday, 27th of March, that a deep and awful sound rolled over the town. It struck every ear and heart. In a few minutes thousands of inhabitants were roused, and poured forth from every house and street towards the river. When I arrived there, which was scarcely more than a quarter of an hour from the firing of the first shot, every point along the whole extent of the Brühlische Terrace, as well as both sides of the bridge, was closely occupied by spectators, on whose faces curiosity mixed with traces of anxiety was the prevailing feature. After several attempts I succeeded in catching

a glimpse of the river, and a very surprising one it was. Below the bridge the river presented its clear and quiet mirror nearly as far as the eye could reach, only in the distance a compact mass of ice slowly and majestically made its retreat, like a defeated enemy who reluctantly gives way after stout resistance. Above the bridge, however, the river was still firmly fettered by the ice, and no immediate sign of its delivery appearing, the multitude dispersed to their homes, with the exception of those who, unwilling to be absent when the catastrophe occurred, took possession of the taverns on the high ground, whence they could obtain a good view of the bridge and of the river. Incredible would it have appeared to them, had any one stood up and declared, that in two days the wild waves should occupy the very place on which they stood, and spread a desolation hitherto unknown.

As matters stood, a general feeling began to prevail that all would go off well, the open state of the stream below the bridge having, as it appeared, removed the danger of a stoppage across the river, and thus given promise of the general safety.

The *Elbmesser*, an instrument to mark the height of the water in the Elbe, and which was affixed to the middle pillar of the bridge, now became an object of general interest, but there was nothing yet to excite apprehension. The *Elbmesser* is divided into ten parts or *ellen*, and at close of day the water did not reach higher than the fourth *elle*. Night came on and quietly passed over; but at five o'clock in the morning of Friday, the thunder of cannon broke the rest of the people all along the river from the Bohemian to the Prussian frontier. At seven o'clock the ice was in full motion near Dresden. The darkness of the morning had hidden the interesting sight of the first heaving up and bursting asunder of the icy coat by the swell of waters beneath; but the view of the river was still imposing and beautiful. Not a glimpse of the water bearing the heavy load could be obtained, and so thickly was it thronged with, for the most part, very large pieces of ice, that it appeared as if the whole contents of the stream were solid, yet in motion. There was no room for what Bürger beautifully describes—

“Die Schollen rollten Schluss auf Schluss
Von beiden Ufern hier und dort.”

Towards five o'clock in the afternoon, twelve hours after the early signal, the water had already risen seven *ellen* over the usual level, and as the rain continued it was very much to be feared that a still higher rising would take place. A crack down one of the middle pillars of the bridge was now a truly awful sight. The far-spread torrent, with majestic grandeur bore downwards enormous blocks of ice, which, arriving at the bridge, seemed to pause in astonishment at the resistance they found, then like giants leaned against the noble building which trembled and groaned under their weight. Yet it bravely withstood their shocks, and gradually crushed and crumbled its powerful enemies, which were then driven furiously through the narrowed arches and whelmed in the roaring whirlpools below. Listlessly stared the thousands of spectators on this grand spectacle when night again closed the scene.

On the following morning, (Saturday the 29th,) there was a return of cold. The thermometer stood at thirty, and the rain changed into a heavy fall of snow. Every one eagerly sought the *Elbmesser*, but turned in disappointment away on finding that inch after inch was being lost in the swelling waters. The increase at this time was generally attributed to the junction of the Elbe waters with those of the Eger, which poured down the melted snows of an extensive mountain region. The dark yellowish colour of the waters was indicative of this having taken place. The river was not now so densely crowded with masses of ice, but in the intervals

(1) The noise of contending flakes of ice resounded from both banks hither and thither.

already were seen broken rafts and timbers, articles of furniture, boats, planks, &c., the too sure signs of the inroads which the inundation was making higher up the river. The situation of several of the more populous parts of the town had become very precarious. The Elbmesser, towards evening, stood at seven and a half. In the lower streets of Friedrichstadt, and those touching the Mühlgraben, and at different quarters at the foot of the Brühlische Terrace, all was bustle and hurry to remove goods and furniture, children, and sick or aged persons, from the ground-floor lodgings, into which the water was rushing with impetuosity. Already the vaults of the theatre began to fill, and in a short time reached the parterre (pit). Boats were sent on carriages to all points where they were then likely to be wanted, and fishermen and the military were ordered to attend them. Bridges were set up, consisting of tressels boarded over with planks to keep up the communication from house to house along the streets, but these soon became unavailing from the swell of the water, so that it was necessary to replace them by boats, removing the bridges to places where they might still be available. A great many doors of houses in the inundated streets were now half their height in water, and the inmates were obliged to go out and come in at the window of the first story.

I must now speak more particularly of my own personal situation in these critical days. You cannot have forgotten my abode at the lower end of the Hundsgasse, near where it joins the Gerbergasse. At the place where the two streets meet, the above mentioned Mühlgraben passes by, carrying the muddy sediment which it has taken up in its course through a considerable portion of the town, with a quick and winding course, to the river. By previous inundations the occupants of the houses near this Graben, and in my immediate neighbourhood, well know that if the water on the Elbmesser reaches seven it will be on a level with this channel, and that any further rising must be followed by an overflow and a consequent swamping of the whole Gerbergasse and lower part of Hundsgasse. The reaching of this seven had (as already described) taken place, and it might be about five o'clock when the water began to wash over the pavement at the end of our street. You remember that the house I inhabit consists of a huge building fronting the street, with two wings stretching backwards, thus forming three sides of a square, enclosing a spacious court-yard, the fourth side being made up by a range of houses close upon the Mühlgraben. Thus we had the enemy in front and in the rear, and soon might be fairly surrounded. I occupied with my family the right wing, which does not properly deserve that name, as it is detached from the other parts, and can only be reached by crossing the yard. The ground-floor of the house is raised about an *elle* above the road, so that you have to ascend three stone steps on entering. Now, when the court-yard had filled with water, we were effectually cut off from the inhabitants of the chief building and left wing. For this extremity no provision whatever had been made, as no one could for a moment suppose that the water would reach so high. We ourselves felt quite easy on the subject, until we saw the water approaching the street door on Sunday morning. Then in all haste we sent out for supplies of water, bread, and sundry other necessaries, and carried up stores of wood and coals to the upper part of the house, where also my little daughter conveyed four chickens, for whose safety she was anxious. Thus we prepared for the siege as well as we could in the hurry of the few hours left us, in which it was possible to pass to and fro. Still we did not think of removing a single article of furniture, clinging still to the hope that, in filling the court-yard, the waters would have reached their height, and would then gradually retire. Fallacious hope, speedily to be disappointed!

SOME ACCOUNT OF DR. RADCLIFFE.¹

In 1699, the Duke of Gloucester, heir presumptive to the crown, was taken ill; and, notwithstanding the antipathy felt by his mother the Princess of Denmark to the personal attendance of Radcliffe, he was sent for: he pronounced the case hopeless, and vented his abuse upon the two other physicians in no measured terms. He told them, "that it would have been happy for this nation had the first been bred up a basket-maker (which was his father's profession), and the last continued making havock of nouns and pronouns, in the quality of a country schoolmaster, rather than have ventured out of his reach, in the practice of an art he was an utter stranger to, and for which he ought to have been whipped with one of his own rods."

At the close of this year, the king, on his return from Holland, where he had not very strictly followed the prudent advice given by Radcliffe, being much out of order, sent for him again to the palace at Kensington. In reply to some questions put by the physician, the king, showing his swollen ankles, which formed a striking contrast with the rest of his emaciated body, exclaimed, "Doctor what think you of these?"

"Why, truly," said he, "I would not have your majesty's two legs for your three kingdoms."

With this ill-timed jest, though it passed unnoticed at the moment, the professional attendance of Radcliffe at court terminated, nor would the king ever suffer him to come again into his presence, notwithstanding the Earl of Albemarle, who was then chief favourite, used all his interest to reinstate him in favour. After the death of King William, which soon after took place, an attempt was made to overcome the repugnance which was felt towards Radcliffe by Queen Anne, but she would by no means consent to his coming at that time to court, alleging, in reply to the recommendations of his friends, that he would send her word again that her ailment was nothing else but the vapours. His advice was, nevertheless, frequently resorted to on the various occasions of her majesty's illness, and for his opinions and prescriptions he was most liberally rewarded.

Radcliffe's keen sighted knowledge of the effects of intemperance did not preserve him from falling into that fashionable vice of the times. There is a singular letter on record from him to the Duke of Beaufort, on the death of their mutual friend Lord Craven, which, while it expresses most affectionate regret for his loss, and some self-accusation at having encouraged his excesses by sharing in them, yet strikes the reader with surprise, that a man, in many respects conscientious, should take so low and slight a view of the moral guilt of a course of intemperance, and only lament his friend's self-indulgence for the fatal consequences that ensued to his bodily health. "His lordship," he says, "from a particular freedom of living which he took, and always indulged himself in, had contracted an obesity of body, that, through want of exercise, made him entirely averse to it. This disposition bred an ill habit of body in him, from whence proceeded dropsical symptoms, which I endeavoured to prevent the effects of by proper remedies. Nor could they have proved unsuccessful, had his lordship been of a less hospitable temper, or the nobility and gentry been less taken with the sweetness of his conversation, and affability of his deportment. Alas! I tremble for your Grace when I consider that all these good qualities, that were so eminent and conspicuous in my dear breathless lord, occasioned the very loss of them for other noblemen's imitation; for by these engaging, these attractive and alluring virtues, the best good-natured companion that ever lived is lost for ever, lost to all our hopes and wishes, and had it not in his power to abstain from what was his infelicity, while it was thought to be his comfort.

"Poor William, Lord Craven! How did I flatter myself with the uninterrupted enjoyment of his inviolate and unalterable friendship during the residue of those few years of life that are allotted for me! how have I dwelled upon the contemplation of his future acts of affection, loyalty, and beneficence to the church, the state, and the commonwealth, when I should be laid low in the earth, and be devoid of means to see and admire 'em. . . . What is incumbent on me is to request of your Grace to take care of a life so important as yours is, in this dearth of great and valuable men, and to assure you that, while you consult the preservation of your health, by letting the exercises of the field share with the pleasures of the bottle; in so doing your Grace will not only give length of days to that which is mortal in your own earthly fabric, but for some time longer prevent the return of that frail timent of clay to its first origin, which as yet continues to be dragged on by, my dear duke,

"Your Grace's most obliged and faithful servant,

"JOHN RADCLIFFE."

Two years after the date of this letter, the Duke of Beaufort was taken ill of the small-pox and the manner in which Radcliffe treated both the disease and the friends of the patient, is thus given by Pettis:—"The doctor was sent for, and found his Grace's window-shutters closed up in such a manner, by the old lady duchess his grandmother's orders, that not a breath of air could come into the room, which almost deprived the duke of the very means of respiration. This method had been observed by the physicians in her Grace's youthful days, and this she was resolved to abide by, as the most proper in this conjuncture, being fearful that her grandson might otherwise catch cold, and by the means of it lose a life which was so precious to her and the whole nation. She had also taken a resolution to give her attendance upon the duke in person during his sickness, and was in the most violent consternation and passion imaginable, when Dr. Radcliffe, at his first visit, ordered the curtains of the bed to be drawn open, and the light to be let in, as usual, into his bed-room.

"Now!" said the duchess, "have you a mind to kill my grandson? Is this the tenderness and affection you have always expressed for his person? 'Tis most certain his grandfather and I were used after another manner; nor shall he be treated otherwise than we were, since we recovered and lived to a great age, without any such dangerous experiments."

"All this may be," replied the doctor, with his wonted plainness and sincerity; "but I must be free with your Grace, and tell you, unless you will give me your word that you'll instantly go home to Chelsea, and leave the duke wholly to my care, I shall not stir one foot for him: which if you will do, without intermeddling with your unnecessary advice, my life for his that he never miscarries, but will be at liberty to pay you a visit in a month's time."

"When, at last, with abundance of difficulty, that good lady was persuaded to acquiesce, and give way to the entreaties of the duke and other noble relations, and had the satisfaction to see her grandson in the time limited at Chelsea, restored to perfect health; inasmuch that she had such an implicit belief in the doctor's skill afterwards, that though she was in the eighty-fifth year of her age at that very time, she declared it was her opinion she should never die while he lived, it being in his power to give length to her days by his never-failing medicines."

During the stay of Prince Eugene in England, which took place this year, he condescended to accept an invitation to dine with Radcliffe, who is said to have treated his princely guest after the fashion of true English hospitality: instead of the ragouts, and other French dishes, with which the nobility entertained him, the doctor ordered his own table to be covered with barons of beef, legs of mutton and pork, and other

substantial British viands; and directed some strong beer, seven years old, to be served round to the company, in addition to foreign wines. The prince was so pleased with this national repast, that, on taking his leave, he addressed Radcliffe in French, to the following effect:—"Doctor, I have been fed at other tables like a courtier, but received at yours as a soldier, for which I am highly indebted to you; since I must tell you that I am more ambitious of being called by the latter appellation than the former. Nor can I wonder at the bravery of the British nation, that has such food and liquors of their own growth, as what you have this day given me a proof of."

In the year 1713, he was elected member of parliament for Buckingham, and began now to retire from practice, recommending Dr. Mead to his patients. During his short sitting in the House he is recorded to have made two speeches, one in favour of the Malt-tax Bill, the other in support of a Bill against the Growth of Schism.

On the 28th of July, 1714, Queen Anne was seized with the sickness which terminated her life. Radcliffe was at this time not in London, but confined by a fit of the gout at his house at Carshalton, in Surrey. Notwithstanding his enemies accused him of refusing to give his professional advice in the case of his sovereign, and a member of parliament went even so far as to move, on the 5th of August, four days after the death of the queen, that Radcliffe should be summoned to attend in his place, in order to be censured for not waiting upon her majesty in her last extremity, in a letter to a friend he indignantly repels this accusation, while he justifies the treatment of her physicians, and says, "I know the nature of attending on crowned heads in their last moments too well, to be fond of waiting on them without being sent for by a proper authority. However, as ill as I was, I would have went to the queen in a horse-litter, had either her majesty, or those in commission next her, commanded me to do so. You may tell Sir John (his accuser) as much, and assure him from me, that his zeal for her majesty will not excuse his ill usage of a friend," &c.

The tide of popular feeling was, however, strong against him, and he was not without apprehension of suffering even personal violence in case he ventured out; for he speaks in a letter of having received several anonymous letters threatening to pull him to pieces if he came to London.

He lived only a short time after this, falling, according to his biographer, a victim to the ingratitude of a thankless world, and the fury of the gout. He died on the 1st of November, 1714, in the sixty-fifth year of his age. He never married, and in the course of his practice accumulated great wealth, which, by his will, was disposed of as follows:—

His Yorkshire estate he left to University College for the foundation of two travelling fellowships; to St. Bartholomew's Hospital he gave for ever the yearly sum of 500*l.* for mending the diet of the patients, and the further yearly sum of 100*l.* for buying linen; 5,000*l.* for the enlargement of the building of University College; 40,000*l.* for the building of a library at Oxford, and when the library should be built, 150*l.* per annum to the librarian, and 100*l.* per annum for to buy books. The rest of his property he left in trust to his executors, to be applied by them to such charitable purposes as they should think best. Besides the Radcliffe Library, which was finished and opened in 1749, the observatory and public infirmary at Oxford were built from these funds, the guardians of which have ever been found ready to contribute, according to their means, to every charitable and useful purpose.

Radcliffe's body lay in state at the house where he died till the 27th of November; from thence it was escorted to his favourite city, Oxford, where he was buried with great pomp in St. Mary's church.

Richardson relates of Radcliffe, that he once said to

Dr. Mead, "I love you, and now I will tell you a sure secret to make your fortune: *use all mankind ill.*" If this saying applies only to roughness and rudeness of manner, it seems to be a secret discovered and practised by other successful members of his profession. Though capable of great acts of generosity, he owned himself to be avaricious, and expressed a great dislike to changing a guinea, because, he said, "it slips away so fast." The authority we have already quoted even says, that he would put off the payment of just debts till the patience of his creditors was worn out. There is a story of a paviour, who after long and fruitless attempts to get his money, caught him just getting out of his chariot at his own door in Bloomsbury-square, and set upon him.

"Why, you rascal," said the doctor, "do you pretend to be paid for such a piece of work? why, you have spoiled my pavement, and then covered it over with earth, to hide your bad work."

"Doctor," said the paviour, "mine is not the only bad work that the earth hides."

"You dog, you," said Radcliffe, "are you a wit? you must be poor, come in;" and paid him.

If this fondness for money be truly imputed to him, it must at the same time be admitted by all that.

"Though he were unsatisfied in getting, (which was a sin,) yet in bestowing he was most princely."

SKETCH OF THE TRADITIONS OF GERMANY.¹

THE lakes, the streams, the rivers, have also their fairy spells, their enchantments. There is the Merman, who ascends, from time to time, a sand-bank, to bask in the sun, singing to allure the passers-by. The merman is, like the dwarfs, complaisant enough when let alone, but inexorable to those who have once offended him. He is of small size, and slender form. He has green teeth, and wears a green hat; but, in the bosom of the ocean-deep, upon the golden soil which the waves hide from our view, he erects palaces of mother-of-pearl and coral. Shells, blue as the azure sky, yellow and violet-hued like the opal, bright as the ruby, tapestry the walls; while garlands, ever fresh and verdant, wreath around his dwelling. He drinks out of a cup of amber, and lies upon an ivory couch. Here, he passes his solitary life, sometimes singing, sometimes swimming over his rich domains, and luring to his palace the souls of the drowned. A peasant, who dwelt on the borders of a lake, had made acquaintance with the merman of the place: they sometimes met on its shores, and chatted together like good neighbours. One day, the merman proposed to show him his abode; and, drawing him gently into the waters, he displayed to him, one after another, his splendid halls. At the extreme end of the royal habitation the peasant perceived a small room, in which were some phials hermetically sealed. He inquired what they contained; and the merman replied that these were the souls of the drowned. After this aquatic excursion, the peasant returns to land; the fate of the poor souls touches his heart with pity, and he resolves to deliver them. He watched his opportunity when he knew the merman was out, approached the lake, and, commending himself to God, plunges boldly beneath the waters. His good angel supports and guides him on the way. He regains the abode of the fiend; and, entering the mysterious chamber, opens every phial, and the souls dart joyously from their prison, and spring upwards to the light and air.

The Nixes, or Spirits of the Mountain, are more beautiful and less cruel than the merman; but they, too, sing to draw the fisherman into their toils. Rarely

can those who once listen to them resist them; and the passing traveller, fascinated by the magic melody, plunges into the stream to hear it more distinctly; and the boatman, on his way home, turns again his bark towards them, and is lost in the treacherous flood. But more especially in the evening, near mills,—on the brink of cascades,—do the fountain nymphs sing their sweetest songs. They have, it is said, eleven different melodies. At a certain distance, a man may listen to ten of them without too great risk; but, let them once come to the eleventh, and old men and children, the sick and the lame, the very chairs and tables, must yield to the wondrous notes, and all begin to dance.

The Nix, or female water spirit, has, like the Siren, the half of the body very beautiful; the rest resembles the tail of a fish. They often come to the surface of the water to play on their harps, or comb with a golden comb their long fair hair. A huntsman having perceived one, and taken aim at her, she laughed in scorn, plunged beneath the waves, and the next day the daring one was found drowned. Sometimes they go, all pale and shivering, and sit all night beside the fires lighted by the shepherds in the fields. They seek the love of mortals, and lavish upon him who loves them every mark of tender attachment, but on condition that he never speaks of them. Some of them have the power of daily leaving the lake in which they dwell, but they must return at an appointed hour. The story runs, that once three young nymphs used to come every evening to visit a hamlet in the neighbourhood of their lake. They entered the peasant's house with their distaff, and sat working, with the other women, round the fire. Every one delighted in them, for many were the wondrous tales they knew, and the sweet songs they sang. But no sooner did eleven strike upon the church-clock, than they departed, and no entreaty could induce them to prolong their stay. A youth became enamoured of one of them, and, to detain them longer, put back the clock, and the young maidens left not till midnight; but the next day were seen on the surface of the lake three stains of blood, and from that time they never again appeared.²

The Germans regarded all these spirits as beings not very orthodox in their nature; and yet they believed that Christianity extended even to them the law of redeeming love and mercy. A child was walking by the river's side, and perceived a nix playing on his harp, and singing to its chords: "Why dost thou sing so mirthfully, poor wretch?" said the child; "knowest thou not that one day thou wilt be for ever lost and condemned?" At these words the nix drooped his head, and wept. The child went away, and told this scene to his father, who was a priest, and who said to him: "Thou wert wrong thus to grieve the water-sprite, for neither he nor his race will be lost." The child ran back to the nix, and repeated his father's words, and instantly the poor spirit took up again his harp, and touched it to strains of joy.

But, if certain chronicles are to be believed, there were other inhabitants beside the nixes in the lakes and rivers. At night, when the heaven was bright, and the water calm, beneath the transparent surface might be seen churches and fortresses; nay, even the hallowed sound of bells has been heard through the crystal wave.³ Sometimes, too, the waters have been the scene of mighty miracles. On the borders of the Lake of Steinberg there once lived a knight, who, by pillage and crime, had become the terror of the country. One day, a young girl happening to pass, he flew at her, and attempted to drag her into his castle. She asked per-

(1) It only requires a glance at the phoca, with its round head, its large green eyes, so soft, so gentle, and its ferried bosom, to perceive how easy it was for it to become the object of popular superstition. Thus the Greeks made of it the Siren; the Germans and Danes, the Water Spirit; and the savages of America termed it the Demon of the Waters.

(2) Southey has embodied this popular belief in a poem, called "The Submarine City."

mission to kneel for a few moments in prayer. She obtained it; commended herself to the Virgin, and then flung herself into the lake,—when, lo, the waters divided, and she passed through the lake as through a meadow! The knight would have followed, but the waves closed over him, and he disappeared. Even now, not unfrequently, are heard, issuing at night from the lake, his tones of anger, and his plaints of love.

All the northern nations attributed a mighty influence to springs, fountains, and rivers. They went at certain periods of the year to draw water from them, and used them in all occult practices. Sometimes in honour of them, they lighted torches on the banks of a river, and they looked upon a troubled fountain as an omen of misfortune, and upon a dried-up spring as a prediction of mourning. Russian tradition speaks of a miraculous water which cured wounds and restored the dead to life, and the German legendary annals recount many prodigies of a similar nature.

The elves, the dwarfs, the kobolds, the nixes, compose the ordinary cycle of traditions; but the Germans found place in their large credulity for a vast number of other spirits,—for the wood nymphs, and the nymphs of the valley; for the fairies whose office it was, like the Parcae and the Nornas, to rule over the destiny of man, to weave and cut at pleasure the thread of his existence; for the warrior virgins who presided over the battlefield, and for the magicians who predicted the future. They had full room for apparitions, for human beings spell-bound in the mountains, or changed into serpents. At Bryneburg, a girl, who was killed by a thunderbolt, appears every night in the midst of the ruins, and during a storm comes to the help of those who invoke her aid. There is another besides, half woman, half snake, who holds in her hand a bunch of keys, and a casket of gold, waiting till some youth who has never known the love of woman, breaks by a threefold kiss the magic spell that enthralled her. In the Castle of Bodo a young girl, who had died for love, rises every night in her shroud, and makes her way, with her white veil and garland of flowers, to the room of any stranger who arrives there. She is still beautiful, though bearing upon her forehead the pale hue of death, and a glance from those eyes, whose brightness the slumber of the grave has not dimmed, is sufficient to trouble the gazer. She approaches the stranger, and speaks to him in soft and melodious tones,—should he not repel her, she puts a ring on his finger, imprints a kiss upon his lips, and calls him her betrothed. But if fares with her betrothed as with that of Lenora, their nuptial chamber is the tomb, a shroud their marriage-bed. Once a young knight slept in this castle, and listened to the maiden's voice; the next day, as he rode off, he perceived three old women crouching by the wayside, and stooping over a coarse thread which they were twisting with their shrivelled and bony fingers.

"What are you about there?" said he to them.

"We weave thy shroud!" answered the old women, and three days after, the young knight was dead.

Frequently the German legend is nothing but the symbol of some moral principle, some lesson of virtue. In order to remember a precept, the people needed a poetic image, and they translated or transfigured into a legend the words of the priest, or the instruction of the father of the family.

A man in his passion for hunting has profaned the Sabbath, and carried his pack of hounds through the corn field of a widow; he is condemned to hunt to the end of the world, to run night and day through the thickets, over the rocks, after a stag which he can never overtake. This legend is to be found in every country of the north, as well as in some of the French provinces,—Brittany, for instance, and Franche Comté.

A young girl persists in marrying against the will of her mother, who curses her, and dies. The very night of the wedding, a fearful storm bursts over the castle, he walls are thrown down, the nuptial couch changed

into stone. The young girl appears on the mountain-top, chained to a bed, with the ravens devouring her.

In a time of scarcity, a bishop of Mayence turned a deaf ear to the complaints and applications of the poor, and as a punishment from heaven, an army of mice penetrated into his abode, and devoured all the stores he had amassed. In vain did he employ every means to destroy them; the mice appeared every day in swarms, and the house was overrun by them. In order to escape them, he crossed the Rhine, and built a huge and strong tower at Bingen; but the mice swam after him, and devoured him in his fortress.

The following legend presents a moral contrast to this, and must not be omitted. A poor pedlar was travelling on foot through the plains of Bohemia, his purse empty, his wallet empty. He was far from any habitation, and a morsel of bread spared from his yesterday's dinner was all that he had. He sat down near a fountain and began his frugal repast, without any hope of a second that day. While there, a mouse approached him and looked up in his face imploringly, as if asking an alms. "Poor little animal!" said the pedlar, "thou art still more destitute than I am; this is all I have left, but I will not eat without thee." And he crumbled his bread, and placed it before her. His breakfast over, he went to take a drink at the fountain, and as he returned, guess what he saw! the little mouse bringing one by one broad pieces of gold to his wallet. She had already brought three, and was gone for a fourth. He followed her, widened the hole at which she got in, and found a treasure.

If, from these legends of human beings, we descend a step in the scale of creation, we come upon all the apocryphal animals so often described by the credulous of the middle ages. Here are the horned wolves with eye of fire, and bloody jaw and tusk, whose counterpart is found in the Russian traditions; as well as the winged wolf, who sometimes changes into a man, and combats sword in hand, then resumes his wolfskin, and takes his sudden flight. Here are serpents issuing from their caves, with a crown of gold upon their heads; here the dragon, stern and horrible, which plays such a prominent part in the Edda and the Niebelungen, in the Iseult Wiser and the Kumpfe Viser.¹ Spencer, in his "Faery Queen," describes the dragon as having a body monstrous, horrible, and vast, swollen with wrath and with bloody gore, covered all over with brazen scales; the sharpness of his cruel rending claws exceeding sharpest steel; deep, devouring jaws, in which were set three ranks of iron teeth,—with blazing eyes like two bright shining shields, while from his mouth, which gaped like the grisly mouth of hell, exhaled a cloud of smothering smoke, and noisome sulphurous stench; his wings were like two sails in which the wind was gathered full, with which, when he did beat the air,

"The cloudes before him fled for terror great,

And all the heavens stood still, amazed with his threat."

The Germans represented the dragon as a monstrous animal, guarding treasures; sometimes also as an infernal being to whom every year a victim must be devoted. The dragon who killed Regner Ladbrok, the valiant king of Denmark, had grown up with the wedge of gold under him. The dragon of Frankenstein spread his fearful claws over the fountain, the only provision of water for the whole country, and none could draw any from it, unless from time to time a young maiden was delivered up to him; a knight killed him, but the dragon had scratched him in the knee, and the knight died of it. In Switzerland, whenever a storm has broken the trees of the forest, the peasants say to this day, "the dragon has been passing by!" A shepherd fell one day into an immense cave, where he perceived two dragons. He was a pious man, and commended him-

(1) Kumpfe Viser is a collection of Danish heroic songs, first published in 1591.

self to his God, and the dragons did him no hurt. But he could not get out, and he passed the whole winter there, living like his formidable hosts on some kind of saline substance that he found on the walls of the cave. When Spring came, he observed that the dragons were about to take flight; he fastened himself to the tail of one of them; and, thus suspended to it, he was carried out of the pit. Once upon *terra firma* he bade adieu to his aerial courser, and went off by himself.

Upon the banks of the Rhine, not far from the fair city of Bonn, the traveller perceives, in the midst of seven mountains, a rock covered with ruins, rising towards heaven like a pyramid. It is called Drachenfels (the Rock of the Dragon). Byron's description of it renders every other superfluous:—

The castle crag of Drachenfels
Frowns o'er the wide and winding Rhine,
Whose breast of waters broadly swells
Between the banks which bear the vine;
And hills all rich with blossomed trees,
And fields which promise corn and wine,
And scattered cities crowning these
Whose fair white walls along them shine;

And peasant girls, with deep blue eyes,
And hands which offer early flowers,
Walk smiling o'er this paradise:
Above the frequent feudal towers
Though green leaves lift their walls of grey,
And many a rock which deeply lours,
And noble arch in proud decay,
Look o'er this vale of vintage bowers.

The river nobly foams and flows,
The charm of this enchanted ground,
And all its thousand turns disclose
Some fresher beauty varying round;
The haughtiest breast its wish might bound
Through life to dwell delighted here;
Nor could on earth a spot be found
To nature and to me so dear.

In the days of paganism a dragon took up his abode upon the steep rock, and to him the people of the place offered up their prisoners of war. One day, in one of their frequent battles, they took a young girl, whom they devoted to the monster. But the young girl was a Christian; she calmly proceeded to the place of death, and, the moment when the dragon, with horrible roar, darted upon her, she drew forth a crucifix and showed it to him. At sight of it the monster uttered a fearful howl, rushed back into his cave, and was seen no more: but the people, witnesses of this miracle, listened to the preaching of the gospel, and abjured paganism.

FRANK FAIRLEGH;

OR, OLD COMPANIONS IN NEW SCENES.

PART THE THIRD.

TO THE READER.

A FAIR good morrow to thee, Courteous Reader; how has the world treated thee, since thou and I held pleasant converse together? Has Fortune smiled on thee? then let thy face reflect the sun-beam of her smile, and, with thy kindly dispositions fostered by its genial influence, do thou look favourably upon others, and in particular upon Frank Fairleigh. But perchance the fickle dame has proved an unkind step-mother to thee, thwarted a pet scheme, brought some favourite "gazelle" of thy imagination to an untimely end, and, having

suddenly grown "virtuous" herself, mulcted of thee thy fair allowance of "cakes and ale!" Never heed her frowns, dear Reader; there is comfort in store for thee even yet. Turn to your "Old Companions," for sympathy and consolation. Frank Fairleigh, sententious Frank himself, shall give you a little of the wholesome advice by which he strives to regulate his own conduct, though being human, and one-and-twenty, he does sometimes fall short of the standard of perfection. Sweet Clara Saville shall fix her deep blue eyes upon you, with an expression of melancholy interest—dear little Fanny shall smile encouragement—Harry Oaklands shall tell you "that it is the worst plan possible to worry and excite yourself about even's that are past, for there's nothing in the world tires one like that sort of thing"—Freddy Coleman shall inform you that "there's not a bit of use in pulling a long face about it, and making yourself look a regular 'caution to owls,'" advising you, if the case is a very bad one, to "put it into the governor's hands, for lawyers are up to all sorts of knowing dodges for helping a fellow:"—while rough but good-natured Lawless shall slap you on the back with painful heartiness, as he recommends you "Never to say die, but to keep up your pluck and be jolly; and if it's any thing in the horse way, that has gone wrong with you, apply to him, and he'll put you up to a move or two which shall prevent that sort of thing bothering you for the future—"Eh, don't you see?"

Yes, Reader, you can't do better than forget your annoyances, in accompanying your "Old Companions" through the following "New Scenes," and by way of beginning, see if you can contrive to feel any interest in—

CHAP. I.

THE STRUGGLE IN CHESTERTON MEADOW.

HAVING now no one to interfere with me, I determined to read as hard as my powers, mental and bodily, would allow, so as to give my talents, be they great or small, full scope, and endeavour to evince my gratitude to my unknown benefactor in the only manner that lay open to me, *i. e.* by proving to him that his liberality had not been thrown away. As the men began to come up, I took care to let it be generally known among my friends that I was reading steadily and in earnest, with a view of going out in honours, and when they became convinced that this was the case, and that whenever I "sporting the door," there was positively "no admittance," they left me to my fate, as one who, in the words of Lawless, "having strayed from the paths of virtue and—eh!—what do you call it?—jollity—had fallen a victim to the vice of mathematics—not a hope of recovery—a regular case of Hydrostatics on the brain—eh! don't you see?"

Besides the regular college tutor, I secured the assistance of what, in the slang of the day, we irreverently termed "a coach," which vehicle, for the conveyance of heavy learning, (from himself to his pupils,) consisted of a gentleman who, but few years older than those whom he taught, possessed more practical knowledge and a greater aptitude for the highest scientific research, than it had ever before been my fate to meet with combined in any one individual. Under his able tuition I advanced rapidly, and reading men began to look upon me as a somewhat formidable rival. Several of my opponents, however, were men of first-rate talent, whose powers of mind, as I could not for a moment disguise from myself, were infinitely superior to my own, and with whom my only chance of competing would be by the exercise of indefatigable perseverance and industry. Daylight, therefore, (which at

this season did not make its appearance over early,) found me book in hand, and midnight saw me still seated at my desk—sometimes with a wet towel bound round my head, to cool the throbbing of my heated brow; at others, with a tea-pot of strong green tea by my side, to arouse and stimulate my wearied faculties from two to four; conventional specifics, of which, by the way, I very quickly discovered the fallacy.

A fear of completely knocking up, however, induced me to preserve some little method in my madness. I laid down a rule to walk every day, and thus, although I grew pale and thin, no very dangerous effects appeared likely to ensue from my exertions.

One evening, about a week before the examinations were to begin, I was taking my usual constitutional after Hall, accident having prevented my doing so at the accustomed time; and careless which way I turned my steps, crossed the river at Moore's, and followed the foot-path which led across the fields to the village of Chesterton. There had been a cattle-fair at some place in the neighbourhood, which had drawn together a number of disreputable characters, and in the course of my walk, I had passed two or three parties of rather suspicious looking men. Having nothing valuable about me, however, I continued my walk. I had advanced some half mile or more, when I was roused from my meditations by a cry of "thieves! thieves! help, ho! thieves, I say!" accompanied by the sound of blows. On looking round, I perceived I was close to a hedge and stile, across which the foot-path led, and from the farther side of which the sounds proceeded. It was growing dark, but there still remained light enough to distinguish objects at a moderate distance. To bound over the stile, and cast my eyes around, was the work of a moment, nor was I much longer in taking part in an affray which was going on.

The person whose cries I had heard, was a stout little man, respectfully dressed, who was defending himself vigorously with what seemed, in the twilight, a club, but which turned out eventually to be an umbrella, against the attacks of a tall strapping fellow, in a rough frieze coat, who was endeavouring to wrest his weapon from him. A more formidable adversary was however approaching, in the person of a second ruffian, who had just armed himself with a thick stake out of the hedge, and was creeping cautiously up behind the shorter man, with the evident intention of knocking him on the head. I instantly determined to frustrate his benevolent design, and there was no time to lose, if I wished my assistance to prove of any avail. Shouting, therefore, as well to intimidate the scoundrels, as to let the person attacked know that there was succour at hand, I sprang upon the man who held the cudgel, and seizing his uplifted arm, succeeded in averting the coming blow from the stranger's head, who ignorant of the impending danger, was making most furious thrusts at his assailant with the point of his umbrella, a novel mode of attack, which seemed to perplex and annoy that individual in no small degree.

I had, however, but little time allowed me to make observations, as the fellow with whom I had interfered, as soon as he perceived that he had only an unarmed man to deal with, appeared determined not to give up his hopes of plunder without a struggle, and freeing his wrist by a powerful jerk, he aimed a blow at me with the bludgeon, which, had it taken effect, would at once have ended all my anxieties, and brought this voracious history to an abrupt and untimely conclusion—fortunately, however, for "my gentle public," (you do think so, now don't you, kind Reader?) and their humble servant, I was able, by dodging on one side, to avoid the stroke, and seeing that matters had now become serious, I closed with him, and after a short, but severe struggle, had the satisfaction of depositing him flat on his back on the green sward. As he fell, he dropped his stick, of which I immediately possessed myself, and planting my foot upon his chest to prevent his rising, I turned

to see how the other combatants were getting on. Dame Fortune had not in this instance acted up to her usual principle of favouring the brave, for the hero of the umbrella, having struggled gallantly for the preservation of his property and person, had apparently at length been overpowered, and, when I turned towards him, was lying on the ground, while his assailant was endeavouring to rifle his pockets, a matter which was rendered anything but easy of accomplishment, by reason of the energetic kicks and struggles of the fallen warrior. It was clear that if I would not have the unfortunate little man robbed before my very eyes, I must go to his assistance—giving therefore my prostrate foe a tap on the head with the stake, by way of a hint to lie still, I advanced to the rescue with uplifted weapon—no sooner did the rascal perceive my approach, than, quitting the fallen man, he sprang up, and without waiting to be attacked, took to his heels, and ran off as fast as his legs would carry him, an example, which his companion, seeing the coast clear, hastened to emulate.

My first act, as soon as the thieves had departed, was to assist the old gentleman to rise. As soon as he was on his legs again, he shook himself, as if to ascertain that he was uninjured, and exclaimed, "Umph! they're gone, ar? they? the scoundrels, high time they should, I think; where's my umbrella? umph! second I've lost this year,—just like me."

The voice, the manner, but above all, the emphatic grunts, and the final self-accusing soliloquy, "just like me," could proceed but from one person, my old Helmsstone acquaintance, Mr. Frampton; though by what strange chance he should be found wandering at owl-light in a meadow near Cambridge, passed my comprehension to conceive. Feeling secure, from the alteration which had taken place in me since I had last seen him, that he would be unable to recognise me, I determined to amuse myself a little at his expense, before I made myself known to him. In pursuance of this plan, I picked up his umbrella, and handed it to him, saying in an assumed voice as I did so, "Here is your umbrella, Sir."

"Thank ye, young man, thank ye, cost five-and-twenty shillings last Friday week; umph! might have got a cotton one for less than one quarter the money, that would have done just as well to thump thieves with—a fool and his money—just like me, umph!"

"I hope you are not injured by your fall, or the rough treatment you have been subjected to?" inquired I.

"Umph! injured?" was the reply—"I've got a great bump on the back of my head, and burst all the buttons off my waistcoat,—I don't know whether you call that injured; but I can tell you, I got away from the Thugs at Strangleabad without any such injuries: Umph!"

"It was fortunate that I happened to come up just when I did," observed I.

"Umph! glad you think so," was the answer—"if that stick had come down upon your skull, as he meant it to do, you would not have found it quite so fortunate, I've a notion—Umph! all the same, I'm much obliged to you; I might have been robbed and murdered too, if it had not been for you, young man, and if you'll walk home with me to the 'Hoop, (there's a name for an inn!) I'll give you a couple of sovereigns, and that's more than you've earned before to-day, I'll be bound—umph!"

"I shall be delighted to see you safe home, Sir, but you will excuse my declining your pecuniary offer, though I must plead guilty to the charge of not having earned as much,—I believe I might say, in my whole life, before."

"Umph! I see,—a gentleman, eh? and I to offer him money,—just like me—a lord, or a duke, I shouldn't wonder—there are all sorts and sizes of 'em here, they tell me—ask him to dinner—Umph! Perhaps you'll do me the honour of dining with me, young man—my lord, I mean,—mulligatawny—cat smothered in rice, which they call curry, kibobs, and kickshaws—the cook

is not so bad for a while; but you should go to India, if you care about eating—that's the place for cookery, Sir."

"I shall have much pleasure in accepting your invitation," replied I, "if you will allow me to run away directly after dinner: I am reading for my degree, and time is precious with me just now."

"Umph! so it should be always. So you are one of the cap and gown gentlemen, eh?" (Then came an aside: "Cap, indeed! it's a fool's cap would fit one half of 'em best.") "Pray may I ask what college you belong to, Mr. —?"

"Lekh is my name, sir—Lekh of Trinity."

"Umph, Trinity: just the man I wanted to get hold of. My name's Frampton, Mr. Lee: they know me well at the India House, Sir. When we've had a bit of dinner, and washed this horrid fog out of our throats with a few glasses of wine, I shall be glad to ask you a question or two. Umph!"

"Any information it may be in my power to afford you," I began—

"That'll do, Sir, that'll do," was the reply. "Perhaps you won't be quite so ready, when you hear what it is I want." Then, in an under tone—"Tell me a parcel of lies, most likely: I know how these young stamps hang by one another, and think it high fun 'to do the governor,' as they call it. Umph!"

On our arrival at the Hoop, we were ushered into one of the best sitting-rooms the inn afforded, where a blazing fire soon effaced all traces of the wet-blanket-like fog in which we had been so lately enveloped. I was shown into a comfortable dressing-room, to get ready for dinner, an opportunity of which I availed myself, to render my appearance as unlike what it had been in former days as circumstances would allow, before again subjecting myself to Mr. Frampton's scrutiny. For this purpose, I combed my hair back from my face as far as possible, and brushed my whiskers (an acquisition of which I had only lately become possessed) as prominently forward as the growth of the crop permitted. I poked my shirt-collar entirely out of sight, and tied my black neckcloth stiffly up under my chin, and finally buttoned my coat so as to show off the breadth of my shoulders to the greatest advantage. Thus accoutred, and drawing myself up to my full height, I hastened to rejoin Mr. Frampton. My arrangements seemed thoroughly to have answered their purpose, for he gazed at me without evincing the slightest symptom of recognition. He shook me by the hand, however, and thanked me more cordially than he had yet done for the assistance rendered him, and then rang for dinner. The bill of fare embraced all the Asiatic luxuries he had enumerated, to which, on the strength of his having invited a guest, sundry European dishes were added; and with appetites sharpened by our recent adventures, we did full justice to the good cheer that was set before us.

THE EXHIBITION OF THE ROYAL ACADEMY.

At no period within our recollection has the position of British Art been so exalted—so full of brilliant promise and performance—as in the present season. The metropolis, the provinces too, are every where rife with Art: it is the leading topic of every conversation, public or private; and "the Exhibition" is no longer alone in its glory in London; but the off-shoots of the Royal Academy are flourishing in every direction, and exhibitions of pictures are to be enjoyed in most of the large towns of the empire.

The influence of this love of Art is evident at every turn, and it spreads through the pursuits of every-day life. Our buildings, public and private, are altogether of better character than formerly, as regards the architecture of their exteriors, and the decoration of their

interiors. We have exhibitions of improved domestic manufactures—of house furniture and fittings,—to stimulate our artisans. This taste has, doubtless, been much fostered by the advances in the illustrated character of our popular literature: illustration is no longer shut up in expensive books, but is extended to our very newspapers, and every class of periodical publication. Of course, there are many grades of excellence in all these artistical productions: in our own sphere, we have made it an object to educate the reader *artistically*, by engravings of pictures that aim at the improvement of the mind and heart through the gratification of the eye; and awaken the gentler passions by the purity of sentiment, and generosity of motive, which the artists of such productions seek to inculcate. To the combined genius of composition and colour—in other words, the pictorial art—even the uneducated eye is not insensible: hence, the effect of this spread of art upon the popular mind is of illimitable influence; and it has, unquestionably, taken the most beneficial direction in leading men from those fierce contentions of "words, words, words," which not long since rendered our cheap literature occasionally offensive to well-regulated minds, and the lovers of social order.

At the moment we write it is the high carnival time of Art in the metropolis. There are open four large Picture Exhibitions, besides the parent Academy; then, there are single pictures, and private galleries to be seen for the trouble of application. The Queen has opened her palace for the exhibition of Winterhalter's two pictures of Her Majesty and the Royal Family; the Ex-Minister has invited the representatives of the educated classes to view his splendid collection; and, no sooner is a portion of the new Palace of Parliament fitted for the reception of the Peers, than the public are admitted by thousands to witness its elaborate beauty and skill. Last month, too, the Art-Union of London distributed some 10,000*l.* worth of prizes through the length and breadth of the empire; and the dispersion of collections of pictures, by sale, is, beyond all precedent, extensive; all which is, more or less, an unmistakable sign of the dominion which the love of Art is exercising over the minds of the people.

The reported excellence of the present Exhibition of the Royal Academy was such as to make us doubt its realisation. However, the opening of the doors on Monday, the 3d inst., soon dispelled all doubt on the matter. Last year, an artist in our hearing declared the Exhibition of 1846 to be the best collection that had been assembled for forty years: then, said an elder brother artist, it is the finest since the institution of the Academy. The general impression is, that the present Exhibition is, in many respects, superior to that of last year: whilst the master-minds of the Academy assert their high position in some of the leading pictures, there is abundance of early achievement as well as promise of talent in other directions: the maturity is flourishing, and the youth in full vigour. The general characteristics are a comparative paucity of portraits; a remarkable absence (with two or three great exceptions) of historical subjects; and an abundance of refreshing scenes of nature, such as gladden the eye and heart, and enlist the sympathies of every visitor; for, in the language of the venerable president, quoted as the epigraph to the catalogue, "To Nature still we must look, through the productions of the great masters, and consider even the best works of antiquity but as the telescopes of taste, to mend our vision, not to bound our view." (*Sheep's Elements of Art.*)

The Exhibition comprises some 700 paintings, in the principal rooms; besides as many drawings and miniatures, architectural subjects, and works in sculpture. Of the 1450 productions we can only notice those of leading excellence, as our arrangements will not allow us to follow the example of some critics, in extending our notice to the duration of the Exhibition.

To begin with pictures of the highest class, we must

take Mr. Etty's *Joan of Arc*, a very large triptic, or storied picture in three compartments, which, with a row of pictures above and beneath, occupies nearly the entire side of the east room. This large picture is about thirty feet long by thirty feet high: the first, or left compartment, represents Joan of Arc, on finding the sword she had dreamt of, in the church of St. Catherine de Fierbois, devoting herself and it to the service of God and her country. The centre, or larger compartment, shows Joan on horseback, making a sortie from the gates of Orleans, upon the enemies of France; and the right-hand division portrays the hapless maiden, after rendering the most signal services to her prince and people, suffering martyrdom at the stake. The sad episode of heroism is wonderfully told: the seizure of the sword is powerfully conceived; the grandeur of the sortie, and the devotedness of the heroine, as her charger gallops over the vanquished and slain foe; and the fervour of the dying heroine;—are all impressive beyond description. There may be defects of drawing in various points of the composition; but the colouring, especially of the flesh, is masterly; and there is a barbaric picturesqueness in the triple scene, which is a startling novelty in British art. The picture has been purchased for the sum of 2,500 guineas, a sum which we hope may prove an incentive to the aspirants to heroic art. Though somewhat out of place, we may here notice Mr. Etty's other contribution—*Aglais, Thalia, and Euphrosyne*, grouped with much of the antique taste, and coloured with the painter's usual success in such subjects, in which he is unapproached.

Mr. Frost's only contribution, *Una*, a poetic impersonation from Spenser, is a charming picture: the lovely maiden is surrounded by "faire hamadryades," "light-foot naiades," and "satyres," in a "woody" scene of beautiful picturesqueness; and the dancing figures in the right-hand distance are the very fascination of painting. This fine work attracted the admiration of the Queen, on Her Majesty's visit to the Academy; and it is stated to have been purchased for the royal collection. In exquisite composition, drawing and colouring, this picture is, perhaps, unequalled in the present Exhibition.

Mr. Maclise's productions are two groups from Moore's Melodies; pretty conceptions of Irish character, but cold and opaque in colouring. The painter's other work is more ambitious—*Noah's Sacrifice*: "the ark resteth on Mount Ararat, the bow is set in the cloud." The passing of the living creatures from the ark is the most successful portion of the picture; the bow lacks refraction, and prismatic effect; and the figure of Noah is equally unsuccessful. Even setting aside the masterly treatment of the same scene by the older painters, Mr. Maclise's work is poor and unsatisfactory.

Near this picture hangs Mr. Turner's single contribution, *The Hero of a Hundred Fights*, a sort of allegory of the casting of Mr. Wyatt's colossal statue of "the great Duke;" with more method, and less extravagance, than Mr. Turner has shown of late, but still sadly puzzling to matter-of-fact, unpoetic spectators. The kitchen esculents in the foreground may be set down as ludicrous; but the foundery, on the right, and the statue in the centre, enveloped in one of the painter's wonderful combinations of colour, will disarm some sceptics as to Mr. Turner's genius; he has many strange fancies, but this is not his strangest, by several degrees.

Another single picture of mark is Mr. Herbert's *Our Saviour subject to his Parents at Nazareth*. The scene is out of doors: Joseph is at work as a carpenter, the Virgin is spinning, and the Saviour is entering, bearing a basket; at his feet is a heap of chips, two of which have fallen crosswise:

"Behold the cross, which chance would oft design
Upon the floor of Joseph's homely shed,
Across thy brow serene and heart divine
A rising cloud of sorrows would spread."

The Virgin is watching intensely the effect of "the cross" upon the youthful Saviour, and the expression of her face is truly beautiful. The Christ is by no means so successfully represented. The background of the picture is stated in the catalogue to be painted from a very careful drawing made at Nazareth.

Mr. Hart has three pictures: one from Scripture, *Righteousness and Peace*, two full-length figures kissing each other; the second is *Milton's Visit to Galileo in the Prison of the Inquisition*, wherein the numerous accessories denote the free-thinking astronomer to be far from uncomfortably lodged. Mr. Hart's third picture, *Toilet Musings*, is a sort of half-character portrait, cleverly painted.

Mr. Leslie, R.A., has also two scriptural subjects—*Martha and Mary*, and *The Pharisee and the Publican*. Both, to our thinking, are poor in composition and colour. The same artist's *Children at Play* proves much more attractive: a little girl is playing "the lady" of the party; and bears her parasol with the air of an *élégante*; and two younger children, driven by a third, with their pinafores for reins, are "playing at horses." These incidents are very winning, but the room is cold and dreary. The children are portraits.

Mr. Harvey, an Edinburgh artist, has a striking picture—*Quitting the Manor*,—the minister leaving the church after the disruption of 1843. It is cleverly painted, though somewhat objectionable in tone and colour.

Here may be noticed a work of small dimensions, but highly artistic character—*Neptune assigning to Britannia the Empire of the Sea*, a sketch for a fresco to be painted at Osborne House for the Queen. This is Mr. Dyce's only contribution: it is cleverly conceived, and has a Rubens-like glow of colour. It has been purchased by the Marquis of Lansdowne.

Mr. Elmore has two pictures. One is from Lord Byron's *Beppo*, and consists of three figures—Lance, her lover, and the Mussulman: it is a pleasing work, but of no higher mark. The second picture is *The Invention of the Stocking-loom*: Lee, after his expulsion from college, sitting with his wife, watching her knitting, by which means he conceived the idea of imitating those movements by the stocking-machine. We admire this work as well for the artist's clever treatment as for the national interest of the subject: it proves very attractive in the Exhibition.

Lance has two largish fruit-pieces, one of which has more composition in it than usual. This is *from the Lake—just shot*: a wild duck, some splendid fruit, a richly chased gold tankard,—all very cleverly grouped, and their gorgeoussness relieved by a nicely painted distance—"the lake." The other picture, *From the Garden—just gathered*, is some magnificent fruit, grouped as it were by Nature, and painted without any of the superb accessories of art. Both pictures are full of rich colouring and masterly manipulation.

The excellence of the English school in landscape is nobly maintained by Stanfield, Roberts, Lee, and Creswick. Stanfield has six pictures—two of them, *Naples* and *Dort*, of great brilliancy and finish. *On the Zuyder Zee* is almost redolent of spray. His largest picture, *French Troops fording the Margra, Sarzana and the Carrara Mountains in the distance*, is a glorious scene. David Roberts's three pictures are—*a Spanish Scene*, *the West Front of Antwerp Cathedral*, and *Edinburgh*; all of characteristic power and beauty. The architectural wonder of Antwerp has its exquisite detail lit up by a splendid sun. Lee's five pictures evince his advance in colouring: *A Misty Morning, with Figures*, *the Watering-place*, and *the Miller's Boat*, are charming productions. Creswick sparkles in his building streams and sunlit trees: one of his five pictures, *the London road a hundred years ago*, with a waggon on the hill-top, has a sort of historical interest. We must not omit to notice *Mule Chabod, North Wales*, a charming picture, by T. Danby: the water, hills, and trees,

and a large bird, are alike admirably painted; and an unmistakable testimony to the excellence of this work is, that it has been purchased by a brother artist in the same class, Mr Creswick. Sidney Cooper has a large Cuyplish picture, *Among the Cumberland Mountains*, with cattle, wonderfully painted.

Witherington has three genuine pictures of English rural life—the *Mid-day Retreat*, *Going to Market*, and *the Village*; the latter with the green—

"The sheltered cot, the cultivated farm,
The never-failing brook, the busy mill,
The decent church that tops the neighbouring hill,
* * * * *

The playful children just let loose from school."

The painter has closely followed the poet, and the touches of truthful nature are very delightful at every point.

Landseer has two large pictures of great power. *The Drive—shooting deer on the pass*, has two men in the foreground, one holding back a couple of fine dogs, the other loading his rifle for a second shot; a capital group. The driving deer on the Black Mount, Glen-Urchy Forest, the background and distance, are hardly as successful as usual; though the picture requires to be seen in bright weather, and such was not the characteristic of the opening day. Landseer's other contribution, *Portrait of Van Amburgh, as he appeared with his Animals at the London Theatres*, is a commission from the Duke of Wellington, who wished to have a picture exemplifying the power of the human eye. The lion-tamer, an excellent likeness, stands in the centre in a den, with tigers on one side, lions on the other, iron bars before him, and a whip in his hand, denoting, however, that something more than "the power of the eye" enables him to maintain his dominion over the quailing lion and the crouching tiger. The rage of the lions is fearfully depicted, and the characteristics of the two specimens of one genus are admirably preserved. There may, however, be some difference of opinion as to the choice of the subject; and, as we have intimated, it scarcely supports the moral—"the power of the eye." "Mr. Humanity Martin" would have protested by way of criticism.

In that class of paintings which may be distinguished as domestic or familiar from its illustrating scenes of every-day life, there are several masterly productions. In such works, by the way, history descends from her stilts, and teaches us many fine humanities for rule and conduct; and philosophy is thus blended with the most popular mode of teaching social duties, for it would be difficult to name a more welcome castigator of human failings and follies than the painting moralist.

Foremost of these pictures is Mr. Mulready's *Burchill offering to assist Sophia in sowing an aftergrowth of hay for the Rev. W. Primrose, the Vicar*, we need scarcely add from Goldsmith's fine English story. The incident is capitally told: Burchill and Sophia are most prominent; in the mid distance, the vicar is watching the pair, and in the back-ground, the young folks playing with the hay, is admirable. The composition is admirable; the colouring beautiful; and the finish so high as make the entire work (about eighteen by twenty inches) resemble a first-class work on ivory. It is stated to be a commission from Sir Thomas Baring, and is, in every way, a worthy companion to Mr. Mulready's *Choosing the Wedding-gown*, in last year's exhibition, and which was purchased by Mr. Sheepshanks, of Rutland Gate, for 1,000 guineas. This munificent patron of art commissioned Mr. Webster to paint the next subject of our notice—*A Village Choir*, from Washington Irving's Sketch Book; here is cousin Simon leading the band of village amateurs, the deep solemn mouths, and loud ringing mouths, of the country bumpkins: their stolidity contrasts excellently with Simon's ardour, and the variety of expression of the whole band, aiming at one common end, is cleverly preserved; the singing girls in front are beautifully painted, especially the earnest simplicity of one of them.

Mr. Redgrave has contributed five pictures of this class, the most important of which is *Fashion's Slaves*—a lady reclining on a couch, and pointing with a scent-bottle in her hand to a clock, denoting that a milliner is behind her time with a dress. The moral is unexceptionable: the poor overworked dress-maker, timid and sorrowful, is a touching portrait of a class of sufferers from what is termed high civilization; and the luxurious and thoughtless folly of fashion is admirably personified. It must prove a sad lesson to many a "lady patroness."

Another of the social abuses of our day is satired in a picture of one of the follies of the last century—*The South-sea Bubble: or 'Change Alley in 1720*, by Mr. E. M. Ward; the tables with clerks, in the Alley, and the eager strife of churchmen and dissenters, whigs and Tories, country gentlemen and brokers, and lady gamblers, as well as the accessories of the locality, make up a work of Hogarthian treatment. Perhaps, the figures are somewhat crowded, and the contrasts are sometimes forced; still, everything contributes to the main story; the famishing boy and the fine lady are an excellent juxtaposition. The picture is very attractive to visitors, for it has a reflex in the railway mania of our own day, and must be a sort of painting lecture to committee-men and directors.

Mr. Frank Stone has a pair of pictures—*The Impending Mate*, and *Mated*, which have been separated in the hanging, although they explain one another—Love foreshadowed in a game of chess. In one picture, the swain and the innamorata are seated at a game of chess; the position of the pieces, by the way, is a first-rate problem. There is, however, as much love as chess in the play. In the companion picture, the battle is settled; the chess-board is put aside, and the wooer is telling his love at the feet of the girl. The pictures are largish; the scene a sort of gallery open to a graceful landscape; and the costume the best of the last century. The girl is exquisitely beautiful, the young man, perhaps, a little too *silky*. They are painted with very high finish, and are very charming works.

Two large pictures, of a Wilkie-like character, tell of the simple joys of rural life,

"When, loose to festive joy, the country round
Laughs with the loud sincerity of mirth."

The first is Mr. Frith's *English Merry-making, a hundred years ago*, a scene of out-door festivity, of "sunshine holiday and chequered shade," which it were hard to describe save by the pencil. The second work to which we have alluded, is Mr. F. Goodall's scene, with the same epigraph as Mr. Frith's, in the catalogue, from Milton's *L'Allegro*. Mr. Goodall's scene is at a village ale-house door; the dance in the centre is charming. We have called these pictures Wilkie-like, but it is only in choice of subject and treatment—not in colouring or finish. There are three or four rising artists in this walk, whose contributions we regret we have not room to individualize.

Portraiture is ably sustained in the collection: the works are fewer than usual; and, we think, of superior character, which is a two-fold improvement. Grant takes the lead: he is the Gain-borough of his day; figures and back-grounds, how beautiful; then for his horses, only look at No. 127: his three-quarter portrait of Hon. Mrs. Wortley is, perhaps, his finest picture; his portraits of Lady Dalmeny and Mr. Sidney Herbert, too, are capital. Mr. Watson Gordon's portraits are in another style of excellence: his whole-length of Principal Lee is admirable. Knight has but two portraits—Mr. Bright, M.P., a whole-length; and Holman, the Blind Traveller, half-length; the head of the latter is surely too large. Of Pickersgill's eight portraits, the best, as well as the most interesting, is a three-quarter of Mr. Hallam, the historian. Mrs. Carpenter's "Mother and Child" are excellently painted; and a large full-length portrait by an amateur, is remarkably finished. We miss Linnell's masterly portraiture; he

has but three works here, and one only a portrait, a lady, admirably painted.

The drawings and miniatures include some fine productions. Richmond and Chalon take the lead in the former; and Sir W. Ross and Thorburn in the latter. Carrick, too, has some fine portraits; and there is a curious pen-and-ink presentation of Jenny Lind, by Minasi, a venerable artist lately rescued from blindness and poverty.

The "Architecture" room contains but few drawings of that class; never do we remember so little castle-in-the-air-building as this season.

The Sculpture Room has a few poetical groups, over and above the average of busts. Marshall's *First Step*, (a child learning to run alone,) and Mac Dowell's *Early Sorrow*, (a maiden unconventional,) struck us as among the best specimens. A small marble bust of the Prince of Wales, executed for the Queen, by Mrs. Thoneycroft, is a clever performance.

In this glance at the entire exhibition, limited to a few columns, it is impossible to do justice to all the successful aspirants to academic honours, who, we rejoice to say, are very numerous.

At parting, we may mention that Mr. Etty's large triple picture, (Joan of Arc,) which certainly has not his usual finish, will, at the close of the exhibition, receive "more work;" it will then be a magnificent specimen of heroic painting. We may notice, by the way, the objection by some, that in the sortie Joan is not sufficiently excited: this is intentional on the part of the artist, and is intended to convey the idea of Joan's *inspiration*, and not the expression of those passions which actuate more ordinary characters: her superior power is told in the serenity of self-possession.

THE GREAT KING'S DAUGHTER.

THERE was a great king who reigned at Rome, who had one son and four daughters. The son, Candidus, was fair, wise, bold and courteous. His daughters were Justice, Truth, Mercy and Peace. The two elder were of commanding forms and severe features, the two younger of slight stature and mild countenances. Desirous of finding a suitable bride for his heir, the great king searched frequently among the regal families, until he chose the daughter of the king of Jerusalem, whose beauty was the theme of every writer at her father's court.

With great pomp the young princess was brought to Rome, and the wedding celebrated amid the joyous admiration of the people, and the hearty congratulations of the great king and his family. For a time all went well, and the young prince rejoiced daily more and more in the beauty of his young wife. But the tempter was nigh at hand, and the peace of the prince was soon blasted. A noble, the confidential servant of the great king, a man of many and fair words, and wherewithal crafty, seduced the young mind of the princess, and led her away by flattery from the prince her husband.

The infidelity of the princess became at length known to Candidus and to the great king his father, and the punishment of the law was awarded upon the faithless princess. Publicly divorced from her husband, and repudiated from him with the loss of every honour, she soon reaped the bitter fruits of her sin. Neglected and deserted by the noble who had led her to sin, she wandered from place to place, begging her bread, and praying for death as a deliverance from her abject misery.

The heart of the young prince was torn with conflicting emotions,—anger at the ingratitude of his wife, and yet love, fervent love for her in despite of her infidelity, and pity for her many sorrows. At last his love and pity overcame his anger, and he sent some of his nobles to seek for her, and recall her to his father's court. Readily did the nobles hasten on their mission, for the princess was greatly beloved.

"Lady," said they, when they found the princess in a far distant country, nearly worn out with hunger, fatigue, and sorrow—"Lady, return in perfect safety; thy lord the prince calls thee back to him; fear nothing."

"Great and mighty lords," meekly rejoined the princess, "tell my lord the prince, that right willingly would I obey his commands were I able so to do."

"Unable, Lady! are we not here to convey thee back to our lord, thy prince?"

"Know ye not the imperial law; if a man marry and his wife prove unfaithful, he shall give her a writing of divorce; and from that day is she no longer his wife!"

"Truly, it is as you say, Lady!"

"Know ye not that to me such a writing was given, for that I was unfaithful to my lord the prince. How can I then return unto my lord?"

"Is not our lord greater than the law which he has made himself? Since, then, he is disposed to forget and pardon; return in peace, secure from punishment or reproach."

"How shall I know that his wishes are such? If my lord would assure me of it, would deign to come and kiss me with the kiss of his lips, then should I be sure of his favour."

Firm in her determination, the nobles brought back the heavy tidings to the prince. Then he called together his wise men, and sought out from among them one that would go and persuade the princess to return. One by one the sages refused the task, and the prince could only send again his former nobles.

"Lady," said they, "thus saith the prince, What can I do for you, there is not a man in my dominions that will execute my wishes."

Sorely wept the princess, but she feared to return, because the law was strict, and the great king was just though merciful. Then went the prince in before his father and bowed before him, and prayed a favour. And when the great king had raised him up and kissed his right cheek, he said, "Speak, my son, and let thy wishes be known unto thy father."

"Father, my love for my erring wife compels me to reseek her society. Twice have I sent to her to persuade her to return, but she fears the imperial law, and refuses to come back, unless assured by me that she may return in peace and security."

"Go, then, my son, in thy might, and reinstate the penitent in the seat from which she has fallen; and you, great and mighty lords, go before our son, and tell the princess how he comes to recal her without punishment and without reproach."

"Father and great king," interposed Justice, "art thou just, and is thy judgment righteous? Is it fit that she who was once unfaithful should again be our brother's wife, the partner of his future throne. You sanctioned the writing of divorce; to the law, therefore, let her appeal. One such violation of justice forbids my being any longer accounted your child."

"My father," said Truth, who stood by the great king, "our sister has spoken truly. You have adjudged this woman to be faithless to our brother. If you permit her now to return, what do you but destroy the very essence of Truth, and prevent me too from fulfilling any more the offices of your daughter?"

"Nay, father," interposed Mercy, "am not I also thy child, and wilt thou abandon Mercy? Forgive, then, the offence of this penitent woman, else never more can I acknowledge thee as my father."

Peace, too, would have spoken for the penitent; but when she saw that there was discord between her father and his daughters, she fled to a far-off place. Justice and Truth, however, swerved not from their purpose, and hastened to place in their father's hand a naked sword.

"Father and great king," said they, "we present you with the sword of Justice. Take it, and strike the faithless woman who hath wronged our brother."

"Enough, father, enough," exclaimed Mercy, rushing forward and snatching the weapon from their hands. "Long have you reigned, and your inclinations been our father's law. Now forbear: is it not fit that my wishes should sometimes be listened to? Am not I also the king's daughter?"

"Truly hast thou spoken, sister," rejoined Justice; "long have we reigned. Yea, and long will we preserve our authority: but come, let us call back our brother, who is wiser than us all, and let him be our judge."

Then Candidus, who had been hastening the needful preparations for his departure, returned to the king's apartment, and heard how Justice and Truth demanded the infliction of the law, whilst Mercy and Peace advocated a free forgiveness.

"My beloved sisters," said Candidus, "the flight of our sister Peace, whom your miserable shifts has driven away, little satisfies. This ought not to be and shall not. As for my faithless wife, I am prepared to undergo her punishment myself."

"If this be your determination, oh my brother," said Justice, "we cannot oppose you."

"Sister," said the prince, turning to Mercy, "use your endeavour to restore my hapless wife. But, should I receive her and she again falls into sin, do you design to renew your intercession?"

"Yes, brother, again and again, if she be but penitent." Then the prince conducted back his sister Peace, and caused each of the others to embrace her in turn: and when concord was thus restored, he set out in search of his penitent wife, and brought her back with every honour.

ALLAN CUNNINGHAM'S POEMS.

THIS little volume consists of the poetry of a man who was in every way worthy of following in the footsteps of the immortal Burns. Sir Walter Scott—Scotland's high priest in the regions of historical romance, himself a poet, and an excellent critic of poetry—was one of the first to recognise the genius of Allan Cunningham, and his discrimination, assisted by the zealous enthusiasm of the Ettrick Shepherd, brought the humble-minded sculptor into public notice.

It is speaking in language higher than all words of praise to say, that there are some verses in this book which Burns himself might have written. To those who love the sweet phrases, and soft and harmonious utterances, of true Scottish song, the lyrics will prove treasures indeed—household beauties, to be sung and listened to through many a summer's day. The collection is divided into three parts; the first containing the imitations of the old ballad Jacobite reliques. These ballads were published in 1810, and brought out by Cromek as veritable remains of Nithsdale and Galloway song. "Short-sighted man,"—"Bonnie Lady Anne,"—"It's hame and it's hame,"—"She's gane to dwell in Heaven," and "Thou hast sworn," are conceived in a spirit of the most poetical fervour. "The Return of Spring" is a lovely composition.

"Could Winter be awa', my love,
And Spring be in her prime,
The breath o' heaven stirs a' to life—
The grasshoppers to chime;
The birds canna contain themselves
Upon the sprouting tree;
But loudly, loudly sing o' love—
A theme which pleaseth me.
The blackbird is a 'rawkie loun,
And kens the gate o' love,
Fu' weel the sickit mavis kens
The melting lift manna move,
The gowd-spink woe in gentle note,
And ever singeth he,
Come here, come here, my spousal dame,—
A theme which pleaseth me.

What says the sangster rose-linnet?
His breast is beating high:
Come here, come here, my ruddy mate,
The gate o' love to try.
The lav'rock calls his freckled mate,
Frae near the sun's be-bree;
Come, make on the knowe our nest, my love,—
A theme which pleaseth me."

The verses which follow, and conclude the song, are equally good, and will remind the reader of the "Smiling Spring," a song written by Burns for Johnson's "Musical Museum;" and one of his most charming lyrics.

"The Mermaid of Galloway," we regret, is too long for our columns, and to quote a line of it in any way would be a sorry mutilation. It is a romantic legend, garbed in a dress of the choicest poetry.

The Second Part consists of Poems and Miscellaneous Pieces. Listen to the "Poet's Invitation":—

"My youngest, fairest, come;
For not the sunshine following showers,
Nor fruit buds to the wintry bowers,
Nor lady-bracken to the hind,
Nor warm bark to the tender rind,
Nor song-bird to the sprouting tree,
Nor heath-bell to the gathering bee,
Nor golden daylight to ad eyes,
Nor morn-star showing larks to rise,
Nor son long lost in some far part,
Who leaps back to his mother's heart,
Nor lily to Dalswinton lea,
Nor moonlight to the fairy,
Can be so dear as thou to me,
My youngest one, my Mary.

The sea-pieces are enough to rouse the blood of all the "English gentlemen who live at home at ease." There is a daring vaunt in them which will find an echo in the heart of many a sailor who loves the sea as his dearest and best mistress. But more to our taste is the "Poet's Bridal-day song." There is a tenderness and beauty in this which makes itself felt and understood in a moment. The Third Part is made up of Songs. The very first has music in it. It is to be hoped that it may find some one among our living composers who will marry it to a melody worthy of its vigour.

"A wet sheet and a flowing sea,
A wind that follows fast,
And fills the white and rustling sail,
And bends the gallant mast,
And bends the gallant mast, my boys,
While, like the eagle free,
Away the good ship flies, and leaves
Old England on the lea.

* * * * *
There's tempest in yon horned moon,
And lightning in yon cloud;
And hark, the music, mariners!
The wind is piping loud;
The wind is piping loud, my boys,
The lightning flashing fer—
While the hollow oak our palace is,
Our heritage the sea."

No description of a poet's lady-love can exceed in simplicity and natural grace the lines that occur in "Know ye the fair one." Here is real poetry—

"Her lips are like the red rosebud,
Dew-parted in a morn of June,
Her voice is gentler than the sound
Of some far heard and heavenly tune."

"The Broken Heart of Anais" is a fair specimen of the earnest force of a man who writes with the feelings genuine and inherent in a lover of the beautiful. Ousting flowers alike in lady's garden or on heathery moor, the poet is ever true and faithful to his vocation; he tunes his lyre to remembrance with the fond emotions that gladden his inmost heart, regardless whether the music floats along the delicate perceptions of his brain, caught from tones that swell in lofty hall, or wander from

peasant lips on village green—so that he retains the melody ere it is lost to him for ever. Of the right craft was Allan Cunningham, and it is a worthy tribute to the memory of so excellent and amiable a father, that his son has in this shape brought together all that he could collect of remains so valuable.

Before quitting this very interesting volume, let us recommend the patient consideration of the modesty which so long a time shrouded its author from public observation, to the aspirant for worldly honours—worldly fame. It is a merit not very common in these high-pressure, progressive times. For the rest, very dull must that heart be, whose throbbings are not quickened by the perusal of many of these sweet songs.

RAMBLES IN BELGIUM.

No. VI.—NAMUR & HUY.

FROM the moment I set foot at Ostend, on Flemish soil, to the time of my departure from Waterloo, I had seen nothing but a flat, level, though fertile, country. The scenery on the road to Namur, however, improves at every step. The banks of the Meuse are beautiful. After passing Sombrefe and Temploux, the road winds a devious way through a most luxuriant valley, on one side of which may be seen the lovely river gliding on, skirting banks and rocks covered with vegetation in its richest garb; and every now and then adorned with a picturesque chateau. There was one point in particular which reminded me of my old favourite ride from Bake-well to Matlock,—the same masses of ivy-covered rock, the same sort of trees growing in every occasional crevice, and the river below like a glittering snake, all bright in the glowing sunshine. There is a hill before Namur can be entered, which is very steep, and adds to the effect of the striking situation of the old town. There is a drawbridge and several very tortuous alleys, all which had to be crossed and traversed before I could reach the Hotel de Harcamp. I was astonished to see the number of cutlers' shops in one of the strange irregular streets, forgetting for the moment that I was in the Belgian Sheffield. If the knives that lay before us at the Hotel, and with which we attempted to cut our meat, when summoned to the early table-d'hôte, were an example of the manufactory of steel, I may safely say my Yorkshire acquaintance need be under no sort of apprehension of being cut out. A lady who was determined to test the merits of some articles temptingly displayed in a large though low shop, was doomed to discover that she had made a bad bargain, for, out of three penknives, two were broken at the first trial. The chagrin of the fair purchaser appeared to be a source of much merriment to some mustachioed and whiskered gentleman to whom she was relating her mishap, and the grapes were swallowed between a grin and a laugh as he listened to the story of the fractured blades. As soon as I could leave the table I departed on a tour round the place. The church, or cathedral, as it is more properly called, is of very little interest. There is the tomb of the gallant Don John of Austria, who died near Namur, from the effects of poison, administered to him by the emissaries of his brother, Philip II. of Spain. An old tradition has asserted, that the reason of this very unbrotherly act was the belief of Philip, that Elizabeth of England would bestow her hand on the conquering hero of so many valorous days. However true it may be that Philip was influenced by such a motive for his brother's assassination, there do not exist any authentic data for supposing our English monarch ever contemplated such an alliance. The church of St. Loup is one mass of decorations, gildings, arabesques, quaint confessionals, coloured marbles, and carvings. Coming from the daylight it had a handsome appearance. The ceiling is elaborately chased in white stone,

and is stated to have been the unassisted work of a monk of the order of Jesus.

There was no necessity or wish to stay longer at Namur, especially as Liege was to be attained on the morrow; so, packing the baggage into the vigilante, which was to follow with the lady of the penknife and her friend, I set out with a dapper little Frenchman to walk part of the road by the Meuse. It was a fine afternoon, and the sun, pouring down his warmest rays, lit the whole route with a genial influence. My companion was in raptures, everything was *conneur de rom*, the air was so light and so bright, the river so cool, so deliciously captivating, the scenery so majestic, that in his phrases I began to think hyperbole was thoroughly exhausted. Nothing could or would arrest his exclamations, which were so constantly on the increase, that on arriving at a turn of the road, where the river was making an angle, as if to show how sportive Nature will be, a fresh series broke out with redoubled vigour, to such an extent, indeed, that I feared nothing but the waters of the Meuse could cool him. However, on we rambled till night and the vigilante overtook us at the door of a small hostelry, where I was rash enough to taste a most horrible liqueur, called Absinthe, the remembrance of which clings to my palate yet, and which "an rhubarb, senna, or purgative draught," can exceed in bitterness. I must be a faithful chronicler, and as such confess that it was highly relished by all my fellow-travellers. It was late when we entered Huy, and rest was very needful after our long walk. Morning was over the Meuse before I could lose myself, an effect of restlessness, tired as I was, I could not help attributing to the execrable Absinthe.

Huy is, like Namur, strongly fortified; its situation on the river is most romantic. The fortress is placed on a rock, and commands the river on either side. Every one of the little party wished to see the works, and permission having been accorded, we paced through them. The rock itself is made to assist in forming places for cannon, &c., where it has been excavated with great care. It is due to the authorities to say that they were very obliging and courteous, sparing no pains to show and explain every thing that attracted our notice. A very richly carved gateway abuts on the cathedral, which is said to have been founded by Peter the Hermit. A hasty glance at the interior was sufficient to see that it was of the Gothic order, and of very elegant design.

It was necessary to cross a bridge on our retreat from Huy, and to pursue the road to Liege on the left bank of the river. We had proceeded a short distance further, when the first vineyard that I had seen in Belgium presented itself. Certainly it had a pretty look; the clusters of purple grapes twined, as it were, round with the green leaves and graceful tendrils; one seemed as it were insensibly reminded of Italy, and those beautiful representations of the old masters, where they so frequently introduce a vineyard in the background of their choicest subjects. I must in justice to dear Old England give the preference, beautiful as some of the vineyards are, to the hop gardens of Kent. The poles are higher, and group themselves into more fantastic forms when swayed or tossed by the wanton winds. The aroma of the hop, too, is so delicious, and there is not that tendency to fall utterly prostrate in the vines, that so often militates to the prejudice of the grape-vine. The grapes we tasted at a house near Huy were of pleasant flavour, not too sweet, and small, both singly and in bunches. Some wine made from the same vines at the last year's vintage was most unpalatable, and afforded a bad specimen of the general quality, of which we were told it was a fair average.

There are some noble views, comprising rock, river, trees, winding roads, luxuriant pastures, retired chateaux, to be seen between Huy and Liege. As this latter place is neared, however, the face of the country assumes a more cultivated aspect, and the rocks and forest-crowned heights recede into a beautiful fertile valley.

Poetry.

In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.

VILLAGE LYRICS.

No. I.—THE SANCTUARY.

W. BRAILSFORD.

STILL clings the ivy to the wall;
Still the elm tree's shadows fall,
Over grave and tomb:
Still flows the gentle river on,
With a sweet murmur of its own
Music in the gloom.

And still, from yonder moss-grown tower,
The bell is heard at Sabbath hour,
Calling men to pray.
Many a heart, that now lies cold,
Underneath the darkness mould,
Bent its thoughts this way.

Ah! the days of our childhood's spring,
When the mind was a gallant thing,
Strong to do and dare:
As life's summer creepeth slowly,
Losing sense of symbols holy,
How it droops to care!

Ever to the world grown fonder,
How we droop, and seldom ponder
On our early time:
When the sound of the village bell
Subdued old griefs, like magic spell
From some eastern clime;

Bringing thoughts of peace and heaven,
With no measure of earth's leaven;
Pointing, with the spire,
To that highest source of sweetness,
Where perfection, and completeness,
Are the soul's desire.

Yet, sometime in the busy crowd,
When cares and woes the spirits shroud,
Bells upon the wind
Will tremble o'er the wearied brain,
And bring in gentle calm again
The old Church left behind.

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne*.

How common it is to hear people talk about conscience, and yet how few there are who consider what it is; for conscience is an agreement or coincidence of the judgment of man with the judgment of God. When conscience condemns what God approves, or approves what God condemns, it is no longer conscience, but deceit and delusion. The conscience of the Quaker assures him that it is needless to be baptized, and the conscience of the Socinian scruples the worship of the Church of England as idolatry; but there is no more reason in the one or the other than in that conscience of the Musselmans which sends them two thousand miles on a pilgrimage to the tomb of their false prophet.—*Jones of Nayland*.

THE other morning I happened to rise earlier than ordinary, and thought I could not pass my time better

than to go upon the admonition of the morning bells to the church prayers at six of the clock. I was there the first of any in the congregation, and had the opportunity, however I made use of it, to look back on all my life, and contemplate the blessing and advantage of such stated early hours for offering ourselves to our Creator, and prepossess ourselves with the love of him, and the hopes we have from him against the snares of business and pleasure in the ensuing day. . . . Were this morning solemnity as much in vogue, even as it is now, at more advanced hours of the day, it would necessarily have so good an effect upon us, as to make us more disengaged and cheerful in conversation, and less artful and insincere in business. The world would be quite another place than it is now the rest of the day, and every face would have an alacrity in it which can be borrowed from no other reflections but those which give us the assured protection of Omnipotence.—*Addison*.

FEET OF THE CHINESE WOMEN.

THAT a whole race should take so much trouble, inflicting and undergoing so much pain, to deface and damage the body, is strange. It is the most universal and curious kind of mutilation practised in any country, and shows how dangerous it is to permit fashion, leagued with false notions of beauty, to tamper with the wholesome operations of nature. There is little doubt that the practice began at first in a small way and with slight results, in a desire of doing what they might, by artificial contrivances, to help in the formation of a small well-arched, female foot, and that it crept on with increasing force, though by scarcely perceptible movements, till it reached its present universal extent, and power of at once destroying all the beauty of the foot, and all but annihilating its functions. While the foot is stunted and crippled the leg wastes, loses its symmetrical roundness and waving outline, and, though other parts of the body are still in a state of vigorous growth, shrinks and withers like a palsied limb. It need scarcely be added that such a condition of the lower extremities must interfere materially with the power of locomotion. Walking is difficult and painful, the gait being uncertain and waddling: the maimed object totters, is in continual danger of falling, and, beyond short distances in girlhood, gladly avails herself of the help of a stick. Yet all this is done and suffered, sacrificing at once beauty and usefulness, in the absurd ambition of completing Nature's operations, and surpassing the scheme of creative wisdom.—*Wilson's Medical Notes on China*.

N.B.—A Stamped Edition of this Periodical can be forwarded free of postage on application to the Publisher, for the convenience of parties residing at a distance, 2s. 6d. per quarter.

The Children in the Wood.

(FROM THE NEW WATER-COLOUR EXHIBITION.)

ACCOUNT OF THE GREAT FLOOD AT DRESDEN, IN THE YEAR 1845.¹

THE night from Saturday to Sunday was stormy and cold; but, notwithstanding this latter favourable circumstance, the water had risen up to eight *ellen*, the height of the famous inundation of 1799, and still continued rising. With terror the people watched the register, and saw inch after inch continually gained by the raging waves. When, on the morning of this never-to-be-forgotten sabbath, I went to the door of my house, I was dismayed at the progress the water had made during the night, and hastily ran back to order all those preparations which I have already named. When this was done, I became desirous of getting a survey of the dominion of the flood in other parts of the town, as far as anxiety respecting my own situation would allow. In two hours the water had overstepped our threshold, and tanners in their great coats were busy erecting the tressel-bridge in our street, to which, from every door, a board led over. Having thus a mode of egress, I soon directed my steps to the great focus of attraction, the bridge, and Brühlische Terrace; but you cannot form an idea, from my poor description, in any measure adequate to the reality of the sight which the river presented. If you can picture to yourself a quiet, inoffensive, nay, ever-amiable and lovely being, wrought up by some extraordinary occurrence to a height of passion, bordering on frenzy, then you may have something of the impression I wish to convey. On passing through the Zwinger, at the entrance leading towards the river, I was met by a rush of water, which, gushing out from one of the sewers, seemed the fierce messenger to announce the speedy occupation also of this pretty spot. Arrived at the Terrace, I stood fixed to the earth in awe and admiration, not unmixed with inward shuddering. For now, it might be about noon, the water-mark was already over nine, and very little below the enormous floods of 1784. Frightful was the rush of the torrent through the arches of the bridge, for the bed of the river is narrowed at that part by the houses on both sides, and by the Brühlische Terrace. The water was actually higher by an *elle* on one side of the bridge than on the other, several of the arches being entirely stopped up: it seemed, indeed, but too probable, that, in consequence of the enormous weight it had to sustain, the noble structure would at length be swept away. For it was not the pressure of water alone which threatened destruction; it was rather the enormous quantities of timber floating down the river. Large trunks of trees, masts, and beams, either with their thick ends ran against the piers like catapults of old, or, swinging round, came across the arches, where, tossed by the fury of the torrent, they were splintered into a thousand fragments. Still, the bulwark of by-gone centuries nobly withstood these shocks, and carriages and passengers went over it with the fullest confidence in its solidity and long-tried excellence. In the place of the ice, the stream was now perfectly covered, not only with the larger species of timber, but with thousands of logs cut short for firewood, together with stores of planks and boards from timber-yards. Some of these latter were situated in the lower parts of the town, and within sight of the Brühlische Terrace, whence the havoc could be clearly discerned. It was really distressing to see how, one by one, the valuable stores, built up in huge stacks, were lifted up majestically from their places, carried into the middle of the stream, and then overturned, and scattered widely over the river. But still more distressing was it to distinguish, among the floating materials, portions of human habitations—house-doors,

thresholds, pieces of furniture, garden-fences, railings, &c., betokening the heavy accidents which must have befallen the villages and towns higher up the river. Glancing across the vast expanse of water to the opposite side, the eye could partly discern the inroads the flood had made into Neustadt and the more eastern suburbs. All the chief streets of those parts opening on the river, together with a number of small lanes running into them, were extensively flooded, those at the eastern extremity chiefly by the back-water of a brook coming there into the right bank of the Elbe. The most imposing view of the whole scene was gained by persons standing in the garden of the Japanese palace. From this height they could clearly see the imminent danger which threatened the bridge and town. Looking downwards, the whole valley appeared like a wide and extensive lake, out of which only the trees, forming the avenues of the Gohege, raised their lofty heads: on the opposite side, poor Friederichstadt looked out from the waves, a second Venice. Leading to the last-mentioned suburb from Altstadt, is a fine avenue of chestnut trees, more than a hundred years old. This connexion was now nearly cut off for foot-passengers, and was only kept up by an odd medley of conveyances. Besides a few boats that plied between the insulated spots, there were also several carts, droskies, and other vehicles, in full activity, carrying over heavy loads of people, not so much as a matter of necessity, but for the enjoyment and amusement of the younger portion of the populace, who, in their thoughtlessness, were delighted with a state of things, which to their elders was a matter of sadness and anxiety. To gratify their eagerness to cross the flooded way, robust men were seen, with large boots up to the thighs, wading through the water, and bearing in succession not a few of the crowd for a trifling sum. At the end of this avenue there is a bridge over the Weisseritz leading to Friederichstadt. From this bridge, whose arches were now nearly filled up, a good view of the havoc going on might also be obtained. The water here was nearly all back-water, caused by the torrent of the Elbe driving back the waters of the Weisseritz. The occupants of a great many old and low-built houses in this neighbourhood were busily engaged in removing their furniture to the top story, or in leaving their habitations altogether. It was certainly a sign of a protecting Providence, as well as a proof of the efficiency of the precautions adopted by the authorities, that in the midst of all these scenes of confusion no accident occurred, but everything was conducted in perfect order and quiet. Charity, hospitality, and Christian kindness were abroad to assist the needy, and shelter those who were driven from their homes. This kindness was even extended to animals: a number of pigs, for instance, were rescued from their flooded sty, and carried into an up-stairs room for safety.

When I returned to my home, after this hasty survey of the town, I found that a boat had replaced the bridge in our street, the latter having become useless from the rising of the water. I also perceived, to my dismay, that the water was within two or three inches of my threshold. It now appeared, indeed, too probable that the water would actually enter our house, and pour through it into the courtyard behind, which, being lower than the street, would have been filled ere this had not the walls of houses on every side prevented the entrance of the water. It was not until this moment that we were convinced of our mistake in supposing that we were safe from the attacks of the enemy. A very little farther rise would now be sufficient to overflow our warm and comfortable apartments. The contemplation of this event saddened our spirits, and though we sat down to dinner as usual, neither my wife nor I could enjoy our meal. But we forced ourselves to take some refreshment, under the idea that strength might be wanted to bear the coming trial. Scarcely had we risen from table when, on looking into the yard, I saw little bubbles rising in the softer parts

(1) Concluded from p. 100.

of the ground, and in the chinks of the paths little pools gathering as from unseen springs. At the same time a rushing and splashing noise in one corner indicated that the water had found its way through the walls of the neighbouring houses. Though the enemy was close at hand, no one took the precaution of securing a passage for us over the court-yard, which indeed would afterwards have proved quite useless, as the common mode of setting up tressels was soon defied by the rapid rising of the water. At this moment it occurred to me to procure from the wash-house a large tub, by means of which I might, in case of necessity, row myself to the opposite side of the yard.

The ground now became more and more like a sieve, through which the water rushed up incessantly. In the mean time the flood had entered one of the houses by the street-door, and passing through, became a rivulet, which poured in a cascade down the stone steps into the yard, thus hastening the conversion of the latter into a reflecting sheet of water. This change was accomplished in less than an hour; streams, also, running from every corner and crevice of the opposite houses. The water having now risen half an elle, I tried my first expedition in the washing-tub, and succeeded, amidst the cheers of the spectators, in reaching the opposite house. There I found a man to whom the opening, and shutting, and cleaning the house belonged, busily engaged in removing various articles. I applied to him for assistance in removing my furniture, especially my piano, from the ground floor, to an upper story. But he said, "How can we manage, both of us, to cross the yard in your washing-tub? and when there, how shall I return? Besides," he added, "you have nothing to fear; the water will not rise so high as to enter your house." This hope I no longer could or would cherish. Therefore, as soon as I had returned from my expedition, my wife and I set to work in earnest in removing as many articles as we possibly could in so short a time. It was all very well while we had to deal with the smaller articles of furniture; but when we came to the heavier ones, we found ourselves little competent to the task. However, the near approach of danger gave us increasing energy, and we managed to secure many of the more cumbersome pieces also. To our dismay, we found ourselves wholly unable to remove the piano, and the most of our failing strength would permit us to do, was to place it upon a strong and heavy table. After the toil of four hours, we were ready to bid farewell to the half emptied rooms; and high time it was to do so. An hour ago, the flood had made a furious rush down into the cellar, and filled it. Pressing upwards from thence, it now began to ooze through the boards of the floor, and soon formed little pools here and there. This was the state of things when, with a sigh, we left our comfortable sitting-room; and very soon afterwards, the rooms were several inches deep in water. Evening now closed in, followed by a night, to us, the most desolate we had ever passed, while, to others, it was one of real danger, threatening death and destruction. Many eyes were open, and many hands folded in prayer. We also slept very little; the sense of being utterly cut off from others, whatever might happen, was too painful to permit of repose. But, if this was our condition, what must have been the apprehensions of those who lived nearer the river! The scene from the bridge that evening was described by an eye-witness as being very awful. The roaring of the torrent, caused by the waves breaking against the piers, was frightfully high, and the spray fell everywhere like hail; while the distorted reflections of the lights on the bridge made the whole only more wild and distorted. A general fear began to prevail, that the pressure of the still increasing waters would act on every street, so as to choke and burst the sewers, and thus bring on Dresden a similar destruction to that by which the city of Pesth had been visited the year before. From this terrible fate we were happily spared. At length, Monday morning came; but the sun rose amidst

mist and drizzling rain. The first look out from our prison was a dreary and distressing one. In our court-yard, as well as in the yards belonging to the adjacent houses, the water had risen to an imposing height, the shrubs having vanished, and only a few trees standing out. The surface of this lake was strewn with floating materials of every description, and a cold damp atmosphere rested upon it, giving an unwholesome chilliness to our encampment. I ran down stairs, to see what advance the water had made in our habitation, latching my boat, namely, my washing-tub, that I might the better examine the state of the piano, and other furniture. I was grieved to find that, without some strenuous effort on our part to remove them, our most valuable articles would soon be irreparably injured. Determined to seek once more for aid, we called across the yard to the occupants of the other parts of the building; but they declared they had no means of getting over to us; and, perhaps, they felt no great wish to do so, having, doubtless, abundant cares of their own. I then attempted to cross the yard in my tub, but without success. The poles I used to urge my vessel forward stuck fast in the mud, and nearly capsize me, so that I was obliged to return, and try a second appeal from the windows. Two women answered me that their husbands were out, seeking for bread; and, even if they were at home, it was scarcely possible they could reach us. Several vain and impracticable schemes occupied another weary hour, but lo! when hope began to fail us, unexpectedly help appeared. A young and courageous friend, who had just heard of our situation, had contrived to make his way to the house opposite ours, where, seeing our insulated position, and hearing our lamentations, he set to work at once making a raft. With a long pole he caught a number of planks as they floated by on the water, drew them to the steps of a staircase on which he stood, nailed them together, and completed his work by placing a large door upon this frame-work. In a few minutes afterwards our hero was seen bravely skimming the ocean, and was greeted by the general applause of the people who had watched his operations. Having tested the safety of his raft, he took on it another friend of ours, and both came to our assistance. Being now three, we were able to remove all the rest of the furniture, including the piano, though, in order to do this, we had to wade in the water up to our knees. Our minds were now more at rest, and a means of communication being opened to us by the raft, we were speedily provided with fresh water, food, &c., and also received the visits of a number of friends.

During the hour in which we had been occupied with the removal of our goods, we fancied there was no further rise in the water; and soon, to our great delight, we found this actually to be the case; not that we dared trust our eyes, but soon the glad tidings were running through the whole town. And truly it was in a time of extremity, that the Almighty thus checked the progress of the waves, for great things had been going on while we were occupied by our petty cares. This we learned of the friend who came to our rescue, and who had been abroad the whole morning.

In front of the royal castle, and round the theatre, the waters had gained ground hour by hour. The Roman Catholic church, nearly in the centre of this spacious place, was now quite surrounded, and its vaults, where the coffins of the royal family are deposited, were completely filled. Street after street became extensively flooded, and much damage was done in the shops of grocers, bakers, and others, who, thinking themselves secure, had neglected to remove their stores. Notwithstanding the precautions of the magistracy, the want of bread and provisions began to be felt. His majesty the king, who had already visited the most endangered districts, set the example of relieving the poor, by ordering the sum of five hundred dollars to be paid to the police for distribution, in the form of bread. Of the

bridge, only the top and railing of the middle now stood above the water. Most of the arches on the Neustadt side were stopped up; and, even at the Altstadt side, where the arches were highest, the water could only with difficulty force its way through. The inundation was now higher than it had been for the last four centuries. The very formidable rising of 1784 was twenty inches lower. At the middle and highest pier of the bridge stood a crucifix, mounted on a pedestal of rock. This pier projected farther into the water than any of the others, and it was here that a crack began to extend itself. No sooner had the sad discovery run through the crowd of spectators, and drawn their eyes to the endangered spot, than the pier, as far as it stood out into the flood, was seen to give way. For one moment the golden image of the Saviour was observed to rock to and fro, the next it sank backwards and vanished beneath the flood, which rushed and foamed as it closed over its booty. For a minute the hum of the thousands of spectators was completely silenced. They remained staring on the empty spot, as if unable to trust their eyes. But then a general cry of grief burst from their lips; women and children began to weep bitterly, and even the men turned pale. Precisely on this fatal pier, up to this moment, a sentinel had faithfully kept his post; and it was not a little remarkable that, although the sentry-box had sunk down at his side, he escaped. The passage over the bridge was now prohibited: and every one expected that the complete destruction of the bridge would follow; but, strange to say, with the sinking of the crucifix the angry demon of the waves seemed to be appeased; for, from that moment, the water did not rise another inch. The sinking of that particular pier was doubtless occasioned by its projection beyond the others, which caused it to be exposed to a terrible body of back-water, and also by a cavity or vault which existed in its upper part, just underneath the pedestal of the crucifix. It must also be remarked, that the bridge was not wholly of stone, but had its internal cavities filled up with sand. This led one of the oldest citizens of Dresden (the bookseller, Arnold) to foretell, only a few months before, the fate which had now befallen the bridge. In spite of this very natural explanation of the circumstance, superstition, and rising party-strife between Roman and German Catholics, caused numbers to avail themselves of the falling of the crucifix, and make the best of it for their particular views. The Roman Catholics declared that the crucifix was overthrown because Christ would no longer suffer his holy image to remain in the midst of an unbelieving population; the German Catholics affirmed that the image was destroyed in order to show the Divine displeasure against idolatry. This latter opinion became very prevalent, even in the minds of persons who had nothing to do with party-strife; and it now appears unlikely that the emblem will ever be set up again in that situation.

The gradual decrease of the waters could now be plainly discerned, and all faces brightened with hope and thankfulness. There was no longer an Elbmesser to consult, for it had been swept away with the falling pier; but the happy fact was sufficiently evident without it. At four o'clock in the afternoon the passage over the bridge was again opened, under proper precautions, for pedestrians only. The next morning, being that of the first of April, the sun rose serenely over the sinking floods; and that day, otherwise a day of deceptions, became at this time one of fulfilled hopes. Nevertheless, the very brightness revealed more clearly the extent of the devastation which had taken place. The sinking of the flood had been three *ellen*, and the water had, in consequence, receded from the royal castle, the theatre, and many other public places. Wherever the water drew back from houses, streets, and squares, persons were busily engaged removing the mud, sand, and rubbish, which was by no means an easy task, as it frequently lay an *elle* deep, and extended over the space of many acres. There were also deep holes rent by the torrent to be

filled up, pavements to be repaired and relaid, and sewers to be examined. Furniture, beds, and thousands of different household utensils which had not been saved, were now brought from their watery graves and exposed to the influence of the sun. At the close of this day the ark in my garden happily became useless, and once more I stood on solid ground. The rooms were also free of water, and in a condition to undergo the necessary cleanings and dryings. By order of the magistracy, no persons were allowed to re-occupy their flooded rooms, until inspection had been made by proper authority. It certainly was not by accident that, for nearly a fortnight following the inundation, the finest sunshine prevailed, and powerfully assisted in obliterating the traces of the calamity, while it also dispersed the foul and damp exhalations necessarily arising from the state of the town.

On the night of the first of April a strong frost set in, which covered still water with a coat of ice, while it contributed to send the river back to its proper channel. The next morning the water had sunk six *ellen*, and the higher objects along the shores reappeared. Reports were now received from the villages adjoining the river, of the imminent danger thousands of persons had been in, and the damage which had been sustained in the fields and meadows. In a village near Dresden the more valuable horses and cattle on a gentleman's estate were actually dragged up to the first story of his house, and accommodated in a suite of apartments appropriated to the summer use of the owner. A little farther up the river a wooden cottage, which had been carried away from the valley where it was built, was washed ashore, very little injured, and firmly settled in a garden belonging to the royal demesnes, where it is left standing, a monument of the ever-memorable event.

Through the wide extent where the flatness of the shores had permitted the river to spread, fields, meadows, gardens, and roads, were greatly injured, both by the deposit of pebbles and sand left by the receding floods, and by large fissures which were rent in the earth. The shores, far and near, were strewed with timber and various fragments, but happily no human bodies were seen among them. The most ghastly scene was, however, presented by one of the churchyards lying in the direct line of the most formidable torrent branching from the main river. Not only were the coffins in the vaults heaved up, and floated about within the walls of the churchyard, but even dead bodies, particularly from new-made graves, washed out and laid bare. The sight is described as having been really horrid, and far more frightful than that of a battle-field. One man told me, with faltering voice, that, when he ventured to climb up and peep over the wall into the cemetery, the first object that arrested his eyes and struck him with horror, was the grim visage of an old coachman whom he had known very well, and who was only buried a few days before. Repenting his curiosity, he at once jumped down from the wall, and made off; but he could not so easily forget the horrible spectacle, which haunted him wherever he went. By the activity of the authorities, all these sad traces of the calamity were speedily removed; and, in a comparatively short space of time, the progress of vegetation restored to the fields and gardens also much of their wonted appearance. The heavy losses sustained by numbers were partly made up to them by the assistance of government, and partly by private benevolence; for people seemed to vie with each other on this occasion in acts of kindness. Thus the tribulation in this, as in many other cases, was the means of bringing forth and ripening the wholesome and heavenly fruit of Christian love.

One of the most striking monuments of the flood was, for a long period, the bridge of Dresden. Two of the other piers sunk, after a few days had passed, and then all communication by it was forbidden. A bridge of boats, during the whole summer, supplied its place until its restoration could be effected.

FRANK FAIRLEIGH;

OR, OLD COMPANIONS IN NEW SCENES.

CHAP. II.

MR. FRAMPTON'S INTRODUCTION TO A ROYAL TIGER.

"I HOPE you feel no ill effects from your adventure, Sir: you resisted the fellow's attack most spiritedly, and would have beaten him off, I believe, if you had possessed a more serviceable weapon than an umbrella," observed I to Mr. Frampton, as we drew our chairs to the fire after dinner.

"Umph! all right, Sir, all right: a little stiff or so across the back, but not so bad as the tiger at Bungleapoor. I'm not so young as I used to be, and there's a difference between young men and old ones. Young men are all whalebone and whipcord, and it's nothing but hopping, skipping, and jumping with them all day long; when you're turned of sixty-five, Sir, the whalebone gets stiff, the whipcord wears out, the skip and jump take their departure, and the hop becomes an involuntary accompaniment to the rheumatism,—confound it! Umph!"

"You have been in India, I presume: I think I heard you refer to some adventure with a tiger," returned I.

"I've been everywhere, Sir—north, south, east, and west. I ran away from school at twelve years old, because the master chose to believe one of the ushers rather than me, and flogged me for lying when I had spoken the truth. I ran away, Sir, and got aboard a ship that was bound for the East Indies, and for five and forty years I never saw the white cliffs of old England; and, when I did return, I might as well have left it alone, for all who knew and cared for me were dead and gone—all dead and gone, dead and gone!" he repeated, in a tone of sorrowful earnestness. Then came an aside: "Umph! wonder what I told him that for; something for him to go and make fun of with the other young scapegraces, instead of minding their books:—just like me!"

"You must have seen many strange things, and met with various adventures worthy of note, in the course of your wanderings," remarked I.

"I must have been a fool, if I hadn't," was the answer. "Perhaps you think I was—umph! Young folks always think old ones fools, they say."

"Finish the adage, Sir, that old folks know young ones to be so, and then agree with me that it is a saying founded on prejudice, and at variance with truth."

"Umph! strong words, young Gentleman, strong words. I will agree with you so far, that there are old folks as well as young ones—old fools, who, in their worldly wisdom, stigmatise the generous impulses and disinterested affections of youth as folly, who may yet live to regret the warm feelings they have crushed, and the affections they have alienated, and find out that the things which they deemed folly, may prove in the end the truest wisdom." Then came the soliloquy: "There I go again—just like me! something else for him to laugh at; don't think he will, though—seems a good lad—wish t'other boy may be like him—umph!" He paused for a minute, and then observed abruptly, "Umph! about the tiger at Bungleapoor. You call to-night's an adventure, Sir: wonder what you'd have said if you'd been there!"

"As I was not, would it be asking too great a favour, if I request you to relate the anecdote?"

"Aye, boy, boy, I see you know how to come round an old traveller: set him gossiping about all the fine things he has seen and done in his younger days, and you win his heart at once. Well, fill your glass, Sir, and we'll see about it," was the reply.

I obeyed, Mr. Frampton followed my example, and after sipping his wine, and grunting several times to clear his throat, began the following recital:—

"Umph! ha! let me recollect. When I was a young shaver, having lived in the world some twenty years or so, I was engaged as a sort of supernumerary clerk in the house of Wilson and Brown at Calcutta; and, having no one else who could be so easily spared, they determined to despatch me on a business negotiation to one of the native princes, about eight hundred miles up the country. I travelled with a party of the — dragoons, commanded by a Captain Slingsby, a man about five years older than myself, and as good a fellow as ever lived. Well, somehow or other, he took a great fancy to me, and nothing would do but that I should accompany him in all his sporting expeditions,—for I should tell you that he was a thorough sportsman, and, I believe, entertained some strange notion that he should be able to make one of me. One unfortunate morning, he came into my tent, and woke me out of a sound sleep which I had fallen into, after having kept awake half the night by the most diabolical howls and screams that ever were heard out of Bedlam, expecting every minute to see some of the performers step in to sup, not with, but upon me.

"Come, Frampton, wake up, man," cried Slingsby, 'here's glorious news.'

"What is it?" said I,—'have they found another hamper of ale among the baggage?'

"Ale! nonsense," was the reply. 'A shikkarree (native hunter) has just come into camp to say, that a young bullock was carried off yesterday, and is lying half eaten in the jungle about a mile from this place; so at last, my boy, I shall have the pleasure of introducing you to a real live tiger.'

"Thank ye," said I, 'you're very kind; but if it's at all inconvenient to you this morning, you can put it off: another day will do quite as well for me—I'm not in the least hurry.'

"It was of no use, however; all I got for my pains was a poke in the ribs, and an injunction to lose no time in getting ready."

"Before we had done breakfast, the great man of the neighbourhood, Rajah somebody or other, made his appearance on his elephant, attended by a train of tawnies, who were to undertake the agreeable duty of beating. Not being considered fit to take care of myself—a melancholy fact of which I was only too conscious—it was decreed that Slingsby and I should occupy the same howdah. Accordingly, at the time appointed, we mounted our elephant; and having a formidable array of guns handed up to us, we started."

"As my companion, and indeed every one else concerned in the matter, evidently considered it completely as a party of pleasure, and seemed prepared to enjoy themselves to the utmost, I endeavoured to persuade myself that I did so too; and, consoled by the reflection that if the tiger had positively eaten half a bullock yesterday afternoon, it never could be worth his while to scale our elephant, and run the risk of being shot, for the sake of devouring me, I felt rather bold than otherwise. After proceeding for some distance through the jungle, and rousing, as it seemed to me, every beast that had come out of Noah's Ark, except a tiger, our elephant, who had hitherto conducted himself in a very quiet and gentlemanly manner, suddenly raised his trunk, and trumpeted several times, a sure sign, as the mahout informed us, that a tiger was somewhere close at hand."

"Now then, Frampton," cried my companion, cocking his double-barrel, 'look out!'

"For squalls," returned I, finishing the sentence for him.—"Pray is there any particular part they like to be shot in? whereabouts shall I aim?"

"Wherever you can," replied Slingsby, "be ready; there he is, by Jupiter!" and, as he spoke, the long grass about a hundred yards in front of us was gently agitated, and I caught a glimpse of what appeared a yellow and black streak, moving swiftly away in an opposite direction—"Tally ho!" shouted Slingsby, saluting the tiger with both barrels. An angry roar proved that the shots had taken effect, and in another moment, a large tiger, lashing his sides with his tail, and his eyes glaring with rage, came bounding towards us.

"Now, what's to be done?" exclaimed I,—if you had but left him alone, he was going away as quietly as possible."

"Slingsby's only reply was a smile, and, seizing another gun, he fired again. On receiving this shot, the tiger stopped for a moment, and then, with a tremendous bound, sprang towards us, alighting at the foot of a small tree, not a yard from the elephant's head.

"That last shot crippled him," said my companion, "or we should have had the pleasure of his nearer acquaintance—now for the *coup de grace*, fire away!" and as he spoke he leaned forward to take a deliberate aim, when suddenly the front of the howdah gave way, and to my horror, Slingsby was precipitated over the elephant's head, into, as it seemed to me, the very jaws of the tiger. A fierce growl, and a suppressed cry of agony, proved that the monster had seized his prey, and I had completely given my friend up for lost, when the elephant, although greatly alarmed, being urged on by the mahout, took a step forward, and twisting his trunk round the top of the young tree, bent it down across the loins of the tiger, thus forcing the tortured animal to quit its hold, and affording Slingsby an opportunity of crawling beyond the reach of its teeth and claws. Forgetting my own fears in the imminence of my friend's danger, I only waited till I could get a shot at the tiger, without running the risk of hurting Slingsby, and then fired both barrels at its head, and was lucky enough to wound it mortally. The other sportsmen coming up at the moment, the brute received his quietus, but poor Slingsby's arm was broken where the tiger had seized it with his teeth, and his shoulders and chest were severely lacerated by its claws, nor did he entirely recover the shock for many months.¹ And this was my first introduction to a royal tiger. I saw many of 'em afterwards, during the time I spent in India, but I can't say I ever had much liking for their society—umph!"

This anecdote brought others in its train—minutes flew by apace, the wine grew low in the decanters, and it became apparent to me that if I would not lose the whole evening, and go home with my brains muddled beyond all possibility of reading, I must take my departure. Accordingly, pulling out my watch, I reminded Mr. Frampton of my previous stipulation to be allowed to run away as soon as dinner was concluded, adding that I had already stayed longer than was altogether prudent. The reply to this announcement was, "Umph! sit still, Sir, sit still; I'm going ring for another bottle of port."

Finding, however, that I was determined, he gave up the point, adding,—“Umph! well, if you must go, you must, I suppose—though you might refuse a worse offer;—but, if you really are anxious about your studies, and wish to distinguish yourself, I won't be the man to hinder you—it's few enough of 'em are like you here, I expect;” then, sotto voce, “wish t'other young monkey might be.”

"You hinted before dinner at some information I might be able to give you?" said I, interrogatively.

¹ The main facts of the foregoing anecdote are taken from Capt. Mundy's very interesting "Pen and Pencil Sketches."

"Umph! did I?—aye, so I did—you see, Mr. Lee, there's a young fellow at Trinity, about your age, I should fancy, whom I used to know as a boy,—and—he was a very good boy—and—and—his mother's a widow; poor thing—a very nice boy, I may say, he was—and as I feel a sort of interest about him, I thought that you might, perhaps, give one an idea of how he's going on—just a notion—you understand—umph!"

"Exactly, Sir," returned I, "and what may be the name of your friend?"

"Frank Fairleigh," was the answer.

"You could not have applied to a better person," replied I. "Frank Fairleigh!—why, he was one of my most intimate friends."

"Was—umph!"

"Why, yes, it's more was than is, certainly—for since I've been reading hard, it's a positive fact that I've scarcely seen his face."

"That looks as if he wasn't over fond of reading, then, himself—umph?"

"You may put that interpretation upon it, certainly," replied I, "but mind, I don't say it's the true one. I consider it would not be right in me to tell tales out of school;—besides there's nothing to tell—everybody knows Frank Fairleigh's a good fellow—ask Lawless—ask Curtis."

"Umph! Lawless? what? that wild young scamp who goes tearing about the country in a tandem, as if a gig with one horse wasn't dangerous enough, without putting on a second to make the thing positively terrific? he must be badly off for something to do, if he can find no better amusement than trying how nearly he can break a fool's neck, without doing it quite;—umph! Curtis—why, that's the name of the young gentleman—very gentle—who, the landlord tells me, has just been rusticated for insulting Dr. Doublechin, and fastening a muzzle and chain on one of the men they call 'bull dogs,' saying, forsooth, that it wasn't safe to let such ferocious animals go about loose—nice acquaintance Mr. Frank Fairleigh seems to choose, and you know the quotation, 'Noseitur a sociis.'"

"Oh," replied I, "but he has others; I have seen him in company with Mr. Wilford."

"Wilford? the noted duellist, that scoundrel who has lately shot the son of Sir John Oaklands, as fine a young man as ever I set eyes upon?—for I have often seen him when I was down at Helmsstone; if I thought, Sir, that Fairleigh was a friend of that man—I'd—I'd—well, Sir," he exclaimed, seeing my eyes fixed upon him with a degree of interest I could not conceal, "it's nothing to you, I suppose, what I may intend to do by Mr. Frank Fairleigh! I may be his grandfather for any thing you can tell to the contrary; and I may choose to cut him off with a shilling, I imagine, without its affecting you in any way—umph?"

"Scarcely so, Mr. Frampton," replied I, turning away to hide an irrepressible smile, "if it is in consequence of what I have told you, that you are angry with poor Frank."

"Angry, Sir, angry,"—was the answer,—“I'm never angry—there's nothing worth being angry about in this world. Do you take snuff, Sir? I've some that came from—Umph! eh!" he continued, fumbling in all his pockets—"hope I haven't lost my box—given me by the Begum of Cuddaleakee—splendid woman—only complexion too strong of the tawny—Umph! left it in the other room I suppose—back in a moment, Sir—Umph! Umph!" and suiting the action to the word, he went out, slamming the door behind him.

As the reader may suppose, I was equally surprised and pleased to find, that my old friend not only remembered our former intimacy, but felt so warm an interest in my welfare, as to have put himself quite in a rage on hearing of my supposed delinquencies. Although it had been the means of eliciting such strong indications of his continued regard for me, I felt half sorry for the deception I had practised upon him—the only thing

that could be done now, however, was to make myself known to him without delay, and his absence from the room enabled me to put in practice a plan for doing so, which I had had in my mind all along. Accordingly, going up to the chimney-glass, I shook my hair forward, so that it fell in waving curls about my face and forehead—took the stiffener out of my neckcloth, and, knotting the latter loosely round my throat, turned down my shirt collars, so as to resemble as nearly as possible the Byron-tie of my boyhood—then unbuttoning and throwing open my coat, I resumed my seat, arranging the candles so as to throw their light full upon my face as I did so.

I had scarcely completed my arrangements, when I heard Mr. Frampton's footstep in the passage, and in another moment he entered the room. "All right, Mr. Lee, all right, Sir; I found the box in my other coat-pocket; I was afraid the thieves might have forestalled me; but—Umph!—eh! why? who?" Catching sight of me as he spoke, he stopped short, and shading his eyes with his hand, gazed earnestly at me, with a look half-bewildered, half-incredulous. Taking advantage of his silence, I inquired in my natural tone and manner, whether he had seen Dr. Mildman lately.

"Umph! Eh! Dr. Mildman!" was the reply—"why it can't be—and yet it is—the boy Frank Fairleigh himself! Oh! you young villain!" and completely overcome by the sudden and unexpected nature of the surprise, he sank back into a chair, looking the picture of astonishment.

Springing to his side, and pressing his hand warmly between my own, I exclaimed, "Forgive me for the trick I have played you. I knew you the moment I heard your voice, when I was helping you up to-night, and, finding you did not recognise me, I could not resist the temptation of preserving my incognito a little longer, and introducing myself to you as a stranger."

"Oh! you young scapegrace," was the rejoinder, "if ever I forgive you, I'll—Umph!—that I will"—then changing his tone to one of much feeling, he continued, "So you hadn't forgotten the old man then, Frank? good boy, good boy."

I had seated myself on a stool at his feet, and, as he spoke, he patted my head with his hand, as if I had been a favourite dog.

"And all the things you said against yourself were no many lies, I suppose? Umph! you are no friend to the homicide Wilford!"

"True to the ear, but false to the sense, Sir," replied I. "Harry Oaklands is the dearest friend I have on earth; we love each other as brothers,—between the man whose hand was so lately raised to shed that brother's blood and myself, there can be little friendship—if I do not positively hate him, it is only because I would not willingly hate any one. Lawless was an old fellow-pupil of mine, and, though he has many follies about him, is at bottom more kind-hearted and well-disposed than people give him credit for; we still continue friends, therefore, but our habits and pursuits being essentially different, I see very little of him—with Curtis I never exchanged half a dozen words in my life."

"Umph! I understand, I understand; and how is Harry Oaklands? better again, eh?"

The reply to this query led to my being obliged to give Mr. Frampton a succinct account of the duel, and it was not till I explained my intention of trying for honours, and made him comprehend the necessity of my being fully prepared for the ensuing examination, that he would hear of my departure; and, when at last he did allow me to go, he insisted on accompanying me to the gate of Trinity, and made me promise to let him see me as often as I was able during his stay in Cambridge, where he informed me he proposed remaining till after the degrees were conferred.

SKETCH OF THE TRADITIONS OF GERMANY.

CHRISTIANITY did not annihilate all the old popular beliefs; it only invested them with a sort of religious veil. However zealous the new converts might be, they could not at once renounce the traditions of their fathers. When converted themselves, they wished to convert with them all the beings whom they had formerly venerated. Like the pope, they placed the image of the saint on the heathen column; and, like the Anglo-Saxons, changed their pagan temples into christian churches. They made of their gods either celestial spirits or fallen angels; of their heroes, martyrs; and retained in the rites of their new worship many of their ancient superstitions. Their teachers tolerated, by a kind of tacit assent, what they could not prevent; but, while doing this, introduced amongst the people a set of new legends, legends of patriarchs, of apostles, of saints, of miracles, and those legends of the devil, which present themselves in so many and such varied forms in the middle ages. Grouped around the devil are the magicians who, like Faust, for a little knowledge sell their souls to him; and the witches, members of the nightly meeting. They assemble every Saturday on the Blocksberg, and sit on each side of the demon goat; the oldest amongst them triumphantly relate their diabolical achievements, while the younger ones listen in hope of instruction. Then comes the ball; each witch gives her arm to some horned demon, and the music begins. Melodious doubtless it must be, the violin being a horse's head, and the bow a cat's tail. The joyous rites over, all the witches prostrate themselves before Satan, and return home on their broomsticks.

In many countries of Germany, there exist monuments which tradition attributes to the devil. Near Altenburgh is a rock, which the united efforts of five hundred men could not move,—the devil put it on his head for a hat, and carried it in triumph through the fields. In the church of Gorlar, there is a hole in the centre of the wall, which can never be filled up. The Abbot of Isolda and the Bishop of Hildesheim were disputing about precedence, and so great was their pride, that they came to blows in the church. The devil entered by this hole in order to prevent any reconciliation, and keep alive the rage of the combatants. Many similar traditions current in other countries, at once present themselves; Ireland has its Devil's Bit, its Devil's Punch-bowl, &c.

But these legends of the devil seem to offer to view a singular feature of the human mind;—the way in which it can caricature an object of fear, render it absurd and grotesque, without at the same time trembling one degree the less before its own ludicrous creation. The devil of the middle ages is a being tricked, played upon, bargaining for a soul as a farmer for an acre of land, and, strangely enough, always keeping faith, always strictly adhering to his part of the compact, while monk and peasant make it their boast to overreach and outwit him. The malice attributed to him is in little keeping with the simplicity which makes him lose in almost every transaction his gold and his pains. Like some mighty crag, around which the clouds group and shape into many a grotesque form; the fearful adversary of man, seen through the legends of the middle ages, appears no longer, as in the awful colouring of Scripture, a being whose mysterious power is only surpassed by his soul destroying malignity. Who would imagine that the term Old Nick, applied in derision to Satan, had in its first origin a far different meaning, borrowed as it is from the title of an evil genius amongst the ancient Danes? Keyser mentions a demon worshipped by the ancient Germans and Danes under the name of Nocca or Necken, styled in the Edda, Nikur, which he derives from the German *nugen*, answering to the Latin *nocere*, to slay, kill, or hurt.

Countless are the legends in which Satan is repre-

sented as cheated and foiled by some clumsy artifice. When the cathedral of Aix-la-Chapelle was building, money was wanting, and the burgomaster was obliged to suspend the work, to the great dismay of the citizens, who took pride in the rising church. The devil came to their assistance; he proposed to finish at his own expense the building, on condition that the first living creature that entered it should be his. The bargain is struck, the work begins, the devil's money builds the church, and soon it is completed; not a pane of glass, not a gilded cornice left unfinished. Now comes the point, Who is to pay the devil?—nobody seemed particularly anxious to be the man. The bells were rung, a great holiday given out; all in vain, not a soul would go near the church; the priests themselves kept at a respectful distance, and those who had mortal sin on their conscience would not go within sight of it. At length, a senator of the town, a man of sense, and ever since venerated as a saint, devised a mode of outwitting the devil. He had a wolf caught in the forest, and brought on Sunday morning to the door of the church; the bells were rung, the great door was thrown open, and two men let loose the wolf into the body of the church, where the devil, who was lying in wait, seized upon him; but suddenly perceiving that he had got nothing but a wretched wolf, he shook the brazen gate of the temple with such fury that he broke it. The next day the priests entered the church in full procession, and the people quietly flocked in to pray.¹

We meet another story, as creditable to the devil's simplicity of character. A peasant of Hesse was in great want of a barn, but could not afford to go to the expense of erecting it. One day, while walking in the fields, and turning in his mind how he could accomplish his object, he saw an old man coming towards him, who said, "I know what is upon thy mind, and I undertake to build the barn between this and to-morrow morning at cock-crow, if thou, on thy part, wilt give me a treasure which is thine, though as yet thou knowest not of it; if the cock crow before the barn is finished, I shall have no claim upon thee." The peasant, who knew very well all his possessions, thought he had made a very good bargain, and ran in delight to tell it to his wife; but his wife said to him, "Unhappy one! What hast thou done? I am pregnant! This is the treasure the devil spoke of, and thou hast given up our child to him." Meanwhile the devil has set to work; thousands of labourers hew the stones and saw the beams. In a few hours the foundation of the barn is laid, and the walls built. Already the doors turn on their hinges, the shutters are put up and the roof covered in. Only one or two tiles remained to be added, and it was still night. The peasant's wife, who had anxiously watched the progress of the work, ran into the poultry yard and imitated so well the crowing of a cock, that instantly every cock awoke and began to crow. The devil fled in a rage, and never could the tile wanting be put on; placed there in the day, it was taken away at night by some invisible hand.

Such are the fairy traditions, the superstitious legends of Germany. But along with this varied and endless cycle, which goes back to the pagan poetry of the East, and comes down to the most mysterious symbols of Christianity, there is another not less vast, not less striking, that of historical traditions. We are now to pass from the fabulous creation to the real being, from conventional nature to actual nature. If we turn to the winding river, to the trackless ocean, it is no longer to behold the fair haired nixæ dwelling in palaces of crystal beneath the waves, or the water sprite entrapping the souls of the drowned. It is to gaze upon the little bark of the fisherman who in the storm commends himself to the Virgin, the boat conveying the pilgrim to the shrine or the knight to the crusade, and the vessel with

its iron prow, upon which the bold pirate ploughs the wave in search of booty. If we wander in the forest, it is no longer to listen for the horn of Oberon or the whistle of Ariel; but to see Genevieve the fair, the hapless, weeping at the foot of a tree, or Bertha escaped from murderous hands, kneeling, calling upon heaven, and sadly regretting her own sweet land of Hungary, and her good mother the queen Blanche fleur. If we climb the mountain, it is no longer to seek the giants which inhabit its rocky cavities, nor the dwarfs fabricating metals into thousand implements; but to call up to fancy's eye the lofty battlements whence resounds the war cry,—the grey turret from which lady-love waves the last fond salute to her departing knight. If we descend to the valley, we no longer behold winged sylphs floating around, but the cell of the hermit tells us its miracles, and the abbey opens to us its book of chronicles.

All these German historic traditions, are not, however, quite destitute of the marvellous, but they have at least a certain basis of truth, they rest upon a fact. The people, giving free scope to imagination, have adorned and embellished them, surrounded them with poetic imagery, but have not altered their primitive character, the name they celebrate, or the event they verify.

Every convent of Germany, every castle, every fortress, has its legend. In our day, when the first stone of an edifice is laid, a medal or coin is placed under it. Formerly a new monument was dedicated by a legend. The monument falls into ruin, the legend remains. In our day, when we build for ourselves a dwelling, one thing alone occupies us, and that is to ascertain what it will cost, and whether it will be comfortable enough. In the middle ages, some thought of love, of heroism, of religion, was associated with every edifice as with every enterprise. A knight-errant returns weary of adventure, and repentant for his sins. He sells his domains, distributes part of the price to the poor, and with the rest builds a monastery. A noble during his crusade falls into the power of the Saracens, prays to the Virgin to deliver him, and on his return erects a chapel to her. A Bavarian baron finds one day at the foot of a rock the bleeding body of his beloved, and, on the spot where she breathed her last, he raises a monument of pious grief. A queen of Germany, seated in her balcony, lets fall her veil, goes to seek for it in the forest, and, as if it had been brought thither by the breath of God, builds an abbey near the bush upon which it had caught. Many an edifice has been projected in a vision of love, and built in mourning, and the votive chapels from many a hill-top, from the shores of many a lake, tell by the place they occupy, by the inscriptions they contain, to what grief they have served as a refuge, to what memory they are dedicated.

In Germany as well as in France the monasteries were the receptacles of all the religious legends,—all the legends of saints, of miracles, of penances; and the legends of the Jews, that wondrous race in itself a miracle, that race so cruelly persecuted by the middle ages. In both countries are found the same prejudices, the same opinions, adduced from different facts, and clothed in different forms. It was firmly believed in Germany that the Jews practised sorcery, that they carried on horrible wickedness in their own houses, and that, to work their magic spells, they disinterred dead bodies and massacred little children. One day a poor country woman was working in the fields; she was alone, she had left her husband and child at home. Suddenly a dreadful foreboding seized upon her, and three drops of blood fell upon her hand. She rushes home and asks for her child; her husband tells her that he has sold him to the Jews, who had just killed him, and he shows her the gold pieces he had received; which, on the instant, were changed into so many leaves. The unhappy mother dies, the husband goes mad, and the Jews are burned. But it would be too difficult a task, to select from the monkish legends, so almost infinite is the number.

(1) The figure of the unfortunate animal in bronze is still to be seen on the top of a pillar at "the Gate of the Wolf," so named in commemoration.

Those of the castles, are all legends either of love or of war. To those purely Germanic are added numbers originating in Provence, Armorica, England and Spain. In Suabia as well as in Cornwall chroniclers have related the adventures of Iristan, and poets sung the fair Yseult. In Thuringia, Wolfram of Eschenbach has revived the name of Arthur and of Percival; the romance of Fleur and Blanche fleur, of the fairy Melusina, of Magulona.

The most celebrated of all the heroes of German tradition is Charlemagne. It is true it imputes to him adventures, of which neither Eginhard nor the Archbishop Turpin ever dreamed. But almost every nation has taken the same liberties with the old emperor. An Anglo-Norman poem makes him travel to Constantinople and to Jerusalem, and the song of Rolando considerably enlarges the frame-work of the battle of Roncesvalles.

One day, says the German tradition, Charlemagne set off for Hungary with a view to convert the pagans. He embraces his wife Hildegarda, and says to her, "Look out for me for ten years; if at that period I do not return, thou mayest consider thyself as a widow, and art free to marry." Nine years elapsed. The nobles of the kingdom, hearing nothing of Charlemagne, press Hildegarda to choose another husband. She resists for a long time, but they redouble their entreaties, and she yields. The husband is chosen, the marriage day fixed. One night, an angel is sent to Charlemagne to warn him of what is to take place. Immediately Charlemagne mounts his horse, and by the power of his celestial guide arrives in three days at Aix-la-Chapelle from Hungary. It was time for him, for already the bells were ringing, the sacristans decorating the church, the counts and barons thronging around the palace; and, when the emperor asks the meaning of all the festive preparations and the crowd, he is told that the next day Hildegarda is to be married. The good emperor does not make himself known, and passes the night in a hostelry; but, the next morning, when high mass was celebrated, he gets first into the church, and seats himself in a chair of gold, in the top of the church, reserved for the emperor's sole use. Then drawing his huge sword and placing it across his knees, he quietly waits the entrance of the priests. The first who perceived the grey-haired man, seated upon the imperial throne, and rolling around him eyes flashing with indignation, uttered a cry of terror. The other priests immediately ran to him, and the bishop, advancing in his robes, demanded of the majestic old man who he was. "Who am I?" cried Charlemagne, in a voice of thunder. "Do you not know me? I am your emperor, whom you ought to serve, and whom you have betrayed!" The Bishop throws himself into his arms, the people salute him with shouts of joy, and Hildegarda blesses heaven for having restored her husband.

What is this but the old Odyssey of Ulysses applied to other names, mixed up with other facts? This story of a man wandering over the world, returning home unrecognised, and finding his wife married or about to be married, belongs not to a single country—to a single individual, but to a whole course of legends, a whole epoch. It is to be found everywhere in Germany, in the legend of Moeringer and Henry the Lion; in Spain, in the romance of Count Islos; in France, in the chronicle of the Sire de Palud.

Another tradition relates, that Charlemagne being at Aix-la-Chapelle, became enamoured of a woman who was neither young nor handsome. Every one was astonished at this singular passion. More than once, those who could speak freely to him even ventured to represent to him his bad taste in such a choice. But neither advices nor reproaches roused him from his infatuation. At last the woman died; and bitterly he wept for her. He had her corpse brought into his room, he kept it near him, and passed whole nights and days in gazing upon it. Already were becoming visible

the signs of decay; but Charlemagne, absorbed in his passionate grief, did not perceive it. At length the Archbishop Turpin suspected, that such a passion could only proceed from magic influence. He entered the room where the corpse lay, had it examined, and found under the tongue a gold ring, which he took away. When Charlemagne returned, he appeared as if he had suddenly awoke from a long sleep. He looked around in surprise, and angrily asked who had brought into his room the loathsome corpse. But immediately his whole affections centered in the Archbishop. He directed to have him continually beside him, and followed him wherever he went. The worthy prelate then perceived all the power of the ring, and foreseeing the misfortunes to which such a talisman might lead if it fell into wicked hands, he threw it into the lake. This, it is said, accounts for the preference of Charlemagne for Aix-la-Chapelle and its lake.

Otho III. opened the tomb of Charlemagne, and found the old emperor seated upon his royal chair, his crown on his head, his sceptre in his hand; death had not altered a single feature; and, when beholding him thus in majestic attitude, with head erect, and shoulders covered with his mantle, the spectator could scarce believe that he was not still in the days when he reigned in Aix-la-Chapelle. The barons of the empire made obeisance, and the proud Otho gazed upon him in reverence.

The name of Rolando, like that of Charlemagne, has been preserved amongst the Germans, and lives in their legendary lore. Towards the left bank of the Rhine, not far from the Drachenfels, is an island, a smiling abode in the midst of surrounding verdure. This island is surrounded by a rocky mountain, on the top of which appear a tower and some battlements in ruins. This is called the Rolandsck, and there tradition makes the illustrious nephew of Charlemagne to have lived for a long time. He loves a maiden, discovers her to be a nun, and builds a castle from whence he may at least gaze upon the convent walls that hide her from his loving eyes. One day the bell tolls a funeral knell, he sees the crucifix, the chapel, the white roses laid on the dark bier. It was his Hildegarda. He abandons the castle, wanders into other lands, and is never heard of more. The song composed in memory of Rolando, was the most famous of all the warlike songs of Charlemagne's days. For a long time, and up to the fourteenth century, the French troops marched to battle singing the song of Rolando; and Robert Wace, in his romance of Rollo, mentions that in 1066, the army, led by William the Conqueror to the field of Hastings, advanced, preceded by a knight or bard who sang with loud voice, "Roland and his companions slain at Roncesvalles." We are also told, that, after the fatal battle of Poitiers, a soldier repeating it in the presence of King John, "Why," said the prince, "do you sing of Rolando, when there is no longer a Rolando in the French armies?" "Sire," boldly replied the soldier, "there would be Rolandos enough, had they a Charlemagne to lead them."

DON'T BE AFRAID.

A TALE.

AGNES WALTON was poor in purse, and poorer still in experience, young and unprotected, as the novelists have it, when she left the unvarying quiet of her village home, for the stir and tumult of the all engrossing city; but the girl knew well that self-protection was the nearest within the limits of civilization. She had made all necessary inquiries before setting out, and, by adherence to the safe policy of her own old maxim, "Take care of yourself, and trust in Providence," Agnes not only arrived safe at her destination, but soon acquired a very respectable degree of usefulness in her new

(1) Concluded from page 94.

calling. Mrs. Carleton welcomed her kindly, and showed her over the establishment, which consisted of a shop, a back parlour, and three bed-rooms so called, though they were in truth only closets promoted to that use, with a supply of furniture proportioned to their dimensions; but Agnes felt herself rising in the world when one of them was allotted to her, with a box of mignonette in the window, which Mrs. Carleton said looked into a very decent court, because, dingy as it was, she had never heard a row in it: even the mysteries of the kitchen and its queen, the single servant, emphatically "of all work," were not left unknown to Agnes, and glad were the four young children to meet her when they returned from school. Yet she had much to learn and something to endure, for the last mentioned is, we believe, attached by way of quit-rent to every lease of life, be the tenement great or small: the habits and scenes of Mrs. Carleton's shop were not those to which she had been accustomed, and her aunt's parting advice often crossed her memory, but only to wake a smile when there was little else to smile at, for she found something disagreeable in London. There were long wearisome days of hard work to please and sell, puzzling accounts to keep, and troublesome customers to be satisfied; there were odd and ungente characters to be met and borne with in the way of business; but Agnes had seen her share of such already, for, in this respect, the golden age has left as faint traces of its steps in the country as in the town. Besides, the smoky and laden atmosphere of the city at times pressed heavily upon her, and the certainty that there was many a long mile of brick and pavement and beaten highway between her and the green fields and trees, haunting her thoughts through many a summer day, that came with heat and dust and long busy hours to the crowded town, but brought roses to the cottage windows where her young sisters sat at work, birds to the tall willows bending over it, and wild flowers under the green hedgerow beside the low stile, where Frederic Lently used to stand and bid her good-morrow. But the evils had their balance. Sunday came, with its long hours of rest, its pleasant churchgoing, and sweet summer walks into the country, from which the town-pent girl returned to her week's toil refreshed in frame and soul by that stolen glimpse of nature.

Letters too arrived, brought by friendly carriers,—for the days of penny postage were not yet come or even dreamed of:—kind letters from her brother and sisters, telling of efforts made and difficulties overcome, and still accompanied with some small country present, saved from their own supply, however slender, and set apart for the absent and the missed.

There came also an occasional epistle from Charlotte, filled with declarations of unchanging friendship, descriptions of the latest traveller who had admired the cottage when she was at the window, and long quotations from the last read novel, the whole being guiltless of both sense and grammar: but Mrs. Lacy generally added a P. S. of good advice, and the burthen of her song was still, "come straight back to your brother." But the power of that oft-repeated counsel was lost on Agnes Walton.

Yet, ever as Valentine's day came round, through the changing prospects of many a year, among the myriads of its letters so meaningless to all but the young hearts that quivered over them, one regularly reached her,—a small square quiet-looking epistle, sealed with the commonest red wax, and the figure of a heart, on which her own initials were graven inside; there was a verse or two from the old songs known in Willowbrook, written in the clear and clerk-like hand of Robert, and a few faded snowdrops from the garden which he cultivated in the early and late hours left him by a country shop.

Agnes always replied, as a cousin should, to that yearly valentine, but never to one that came oftener, though not so constantly,—a gay gilded paper, richly embellished, and filled with quotations from the fashion-

able poets, for they say there is fashion in such things; and that costly valentine might have suited a lady's boudoir, but not the bedroom of a poor shop girl; yet it was carefully laid up, often brought out, looked at, but never shown, for Agnes knew the handwriting was that of Frederic Lently, and he was the son of a London merchant. The girl's apprenticeship was soon over, for she was determined to be taught, and Mrs. Carleton fulfilled her promise by assigning a small salary as soon as she became really useful; and what a fund of hope and satisfaction was that slender remuneration to Agnes, who now for the first time in her life found herself the possessor of an income on whose amount she could calculate with certainty! in truth, it was easily reckoned, hardly earned, and carefully spent, but it gave Agnes many an opportunity of returning the tokens of remembrance received from Willowbrook. There were smart gown pieces, gay ribbons, and gloves as good as new, which could be bought at a trifle, and transmitted as their presents had been; and, above all, there were cheap books which were pearls of price in long winter nights to the children at the cottage; even the Lacys were not forgotten; an occasional handkerchief was sent to Charlotte, and her five juniors were remembered with similar presents, which, however, in justice to Miss Lacy, we must acknowledge, she always wore in right of seniority; but the gifts were discontinued, for the fact was discovered; but Robert got a whole newspaper to himself without borrowing; and Mrs. Lacy observed that there was no standing the pride of them Waltons, the minxes wearing all the fine things their sister sent them from London, and she hoped that creature (as the kind aunt generally denominated Agnes) was not casting an eye on her Robert, as he was something above a tradesman's daughter, and, besides, had the family to support."

The lady need not have been alarmed, for Agnes was better engaged. As time wore on, the girl grew more expert in business, and gained a share in those advantages which cities confer on the masses;—for, in spite of all that has been said and sung regarding the vices of towns, we believe that the great marts of the world present to their toiling thousands lessons of good, and opportunities for mental improvement, which are not found in the calm, but sometimes muddy, current of country life. Agnes found means, through cheap libraries and weekly lessons, to enlarge the bounds of her Willowbrook education, which the accounts of Mrs. Carleton's shop had "weighed in the balance and found wanting;" its foundation was laid at the charity school, in the early orphan days, when bread was all that the children could gather. But it had subsequently advanced under better times, and the management of the parish clerk, who was also writing master and accountant general to the district: however, as we observed, Agnes had found its deficiency, and therefore did her best to improve; and improve she did, for those who do their best rarely fail in their object. Besides being able at least to keep the books as well as Mrs. Carleton, she contributed something to forward her young sisters in similar attainments; and Alice, who was the genius of the family,—for we believe every family has one,—was soon regarded as a prodigy of ability, in what the learned Alderman called the three great r's of England.

Mrs. Carleton's business grew and prospered day by day, for she was a managing woman. Agnes found in her a friend as well as an employer; the widow's children were still young, and she was alone in her management, for the companion of her youth had left no room in her heart for a second. No wonder then that the woman turned to Agnes, her active assistant and gentle companion; and, as the best proof of friendship, she increased the girl's salary in proportion to her own profits. Agnes had early begun the saving system, and, though her little stock increased slowly, its growth was very sure, so that after four years' residence with Mrs. Carleton, when the widow found herself able, and we

may add willing, to remove into a larger house, and a more fashionable street, she offered her whole capital, and was accepted as a minor partner in the firm.

"Charlotte never writes now," said Agnes, as she folded up the letters just received from the country carrier, and read by the first light of the gas, while she walked on to see how Mary liked her new place; for Mary had always a taste, and a hand for shaping; and a dress-maker of Mrs. Carleton's acquaintance, who happened to have more work than girls on hand, had lately taken her as an apprentice, with a fee, which she assured Agnes was next to nothing, though it swallowed up the entire profits of her first year's partnership. Yet the girl's heart and step were light, for her letters brought good news. Alice, whose accomplishments have already been mentioned, was now appointed assistant to Mrs. Green in her deportment and fancy-work teaching establishment. Ellen and Elizabeth, for the washwoman's nursing had grown a tall and fair-haired girl, got as much work as they could do, and William was rapidly accumulating the capital necessary to commence partnership with Rose White in the matrimonial line.

But there was no news of the Lacey. "Could anything have happened to offend Charlotte, or has she forgotten me?" thought Agnes, as she recollected that Miss Lacey's last letter had been written almost three months before, and contained a complete description of the great figure Frederic Lently on a visit to his old teacher during the Cambridge vacation. The gay gilt valentines had ceased long ago; and an involuntary sigh rose to the girl's lips. It might have been a voice from where the young lay up their early wrecks of memory, or a mere expression of fatigue, for that day had been a busy one in the shop. And Agnes had three long miles of street and square to traverse before she could see her sister, and learn how things went with her. Half the distance was already done, and her way, which had hitherto been through the less frequented streets, now led through one of those public thoroughfares or arteries of the great city, through which the living stream pours on incessant as the old Thames itself, but some unusual occurrence had drawn the passengers together in front of a very dashing, though not very well reputed, house.

Agnes paused; for the crowd, which almost blocked up the street, was momentarily increased from every lane and alley, whose nondescript inhabitants thronged and jostled each other round a dusty post chaise, beside which a tall and fashionably dressed man stood in an attitude of the most careless ease, listening to a portly and very angry old gentleman, who harangued from a street cab, whilst a woman screamed in chorus from the window of the chaise. But there was a tone in that woman's voice that brought Willowbrook with its broad sunny downs and white cliffs to her remembrance. "I'll make way for you, ma'am," said a policeman who happened to know her, and Agnes moved forward.

"Oh, you villain! after all my care and anxiety to give you a religious education," vociferated the occupant of the cab, "but you're my only son, Freddy. Leave the seducing slut, and I'll forgive you."

"Very generous, 'pon my soul," said the young man, looking round, and Agnes saw the yet unforgotten face of Frederic Lently.

Five years had made terrible changes there, though the features were still handsome. But the frank and cheerful glance of the dark-eyed boy was gone. Early dissipation, and vice habitual and shameless, were graven on its manhood. Agnes stood heartstruck for a moment. Alas, for the work of time, and the trust of memory! but, as he proceeded to enter the cab, with "I think I will go, old fellow," the woman sprung from the chaise, and rushed towards him, exclaiming, "Dear Frederic, don't desert me—won't we be married?"

"Certainly, my dear," said Lently, (endeavouring to extricate his skirts from her hold,) "when the old fellow comes to," he continued, winking at the by-

standers, who laughed and shouted "he was a run one." And Agnes felt fairly bewildered with astonishment when she recognised the washed out finery and pretty doll-like face of her cousin Charlotte Lacey.

Time had wrought no change on her, for the character was still the same; but her eyes were red with weeping, and she clung to Lently in such evident terror, that, in spite of anger, in spite of shame, Agnes instinctively pressed forward to the rescue. "Step into that house, my dear," said Frederic, who found he could not get her shaken off as easily as he at first imagined. "Step into that house, and I know they'll pay you every attention, on my account."

"That we will, Mr. Lently," said a bold-looking flashy dressed woman who stood in the door.

"Let go my son, you wretch," shouted the old gentleman, as he attempted to haul Frederic in, while Charlotte still clung to his skirts, inquiring what sort of a house it was, and the crowd shouted their adjurations to both parties to "hold on, and pull away."

"Come with me, Charlotte," said Agnes, who had now got beside her cousin, grasping the poor girl's arm as she spoke. At the sound of her voice, Frederic, who had been answering the ribaldry of the crowd in evident enjoyment of his position, (for the downward progress is easy and rapid, and he had advanced far and early in the degradation of vice,) turned quickly round, and caught a glance of her upturned eye, resting at once upon himself and Charlotte. Readers, the past has spells from which no after time can bar us; and that look, in the midst of his hardened profligacy, rebuked the man with the memory of his better days; his countenance fell, and turned crimson to the brow, and thrusting his hand hastily into his pocket, he drew forth a purse, which he pressed into Charlotte's now relaxing hand, and darted into the cab, which was instantly driven off with a speed that soon left the hooting mob far behind. "Come, Charlotte," said Agnes, drawing the poor girl, who now seemed half petrified, as quickly as possible from the scene.

"Here's a cab for you, ma'am; I called it," said the policeman, for he never forgot that Agnes had been kind to his poor wife, when, as the guardian of the peace expressed it, "things were very low with him before he got the situation."

"Thank you," said Agnes, as she slipped in, and the policeman lifted Charlotte beside her, and away they drove, by his desire, to his own lodgings. The policeman knew that Agnes could not bring her cousin to Mrs. Carleton's house, under the circumstances, and therefore kindly offered her an asylum for the girl in his own humble but decent abode; and there Agnes learned the story of poor Charlotte's misfortunes: it was such as might have been expected, from her useless dependent life and pretty face, which she was convinced would one day make her fortune, and total ignorance of this world and all its ways.

Frederic Lently, on going to college, made full proof of the benefit of a secluded education, by being first led, and afterwards plunging deeper, into vice than most of his companions, till, having at length desperately offended his father, by all sorts of extravagance, and consequent debt, he adjourned to Willowbrook as a place of penance, and, finding nothing better or worse to do there, took to killing time by "falling in love," as he termed it, with Charlotte; and the poor girl, in a fit of anger with her family, for the unemployed are apt to quarrel, was induced by her own folly, and Frederic's eloquence, to elope with him to London.

Charlotte was one of the many who fear to think or act for themselves in the real interests and duties of life, but acquire marvellous courage in matters not only wrong but dangerous. She of course anticipated marriage, and so did Frederic's father, for the transaction happened to reach his ears; and, as the merchant's wrath was entirely merged in the fear of his son forming a low connexion, he hastened to interfere; and

overtook the pair, in his cab, just as they reached the house already mentioned, which had been for some time the chosen rendezvous of Master Lently.

Agnes had seen the result of the old gentleman's endeavours, and, whatever might have been his opinion of Charlotte, he had certainly served her by preventing the worst consequences of her foolish journey.

"Why, I thought you would be afraid to come to London, Charlotte," said Agnes, in unfeigned surprise, as her weeping cousin concluded the narration.

"Oh, but I came under his protection," sobbed the weeping Charlotte, "and he promised never to forsake me."

"Charlotte, Charlotte, such promises are not to be depended on; Providence and prudence are our best protectors, and, believe me, they are always safest who trust in them; but in the meantime what is to be done?" said Agnes; "we might hit on some plan for you in London, as I am sure you would not wish to return home."

Charlotte had no answer for this but declamations against the villany of men, and threats of drowning herself immediately, which however she seemed in no haste to execute; and Agnes knew the paroxysm would wear off sooner than the crushing weight which that day's occurrences had left on her own heart.

"True, Charlotte," said she, "there are wicked men enough, and foolish women too, God help the world! for it has been long and deeply cursed by the vice of the one and the folly of the other; but talk no more of dying, for, when one has not learned to act their part wisely on earth, why should they venture on eternity. But what is this?" continued the girl, as her eye fell on Frederic Lently's purse, which Charlotte had flung from her on the floor, vowing never to touch it, though she acknowledged she had come to London without a farthing in her pocket. It contained six sovereigns, all the man could command at the moment, and Agnes knew it had been given as an offering to the shade of his youth's departed virtue, and the last that he might ever make. Yet she sympathized in that lingering of decent pride in her cousin, and the policeman left it at Lently's house the same night.

"If you please, Miss Walton," said his wife, now re-entering the small room which, with a delicacy not always found in better stations, she had left to the cousins, that they might talk over their troubles alone, "there is a quiet decent looking man here outside, asking for Miss Lacy."

"My brother!" said Charlotte, and before Agnes had had time to answer, Robert Lacy stepped into the apartment.

The years of their separation had passed on him with heavy, though not changing steps; the frame had grown more square and muscular, the face more thin and grave, and the brow had more that sober head-of-the-family expression, found among elderly married men, with whom things have not been very prosperous; but the look was still sad and patient, though yet still subdued and kindly in its glance, and the coat was as well brushed and as threadbare as ever. His errand to London was not a pleasant one, for he came in search of his foolish sister, and had left a sorrowing family at home; yet, at the sight of Agnes, his countenance brightened for an instant with a joy that seemed shed back from the years of childhood, before he grew careful and troubled about many things and sisters.

"Oh, how are you, cousin?" cried he, grasping her hand, "I am glad, glad, to see you, blessings on all your good fortune, Agnes, I knew you would come to something yet; but you are pale, I think far paler than when you left Willowbrook: will you never come back to see your sisters and William? they are all well and happy. But tell me, how is Mary—and don't cry, Charlotte," continued the kindly brother, as the sobs of the poor girl, who had half concealed herself in a corner on his entrance, now became audible. "Oh, why did you leave us? but come home with me, and

we'll never have a word about it. I know you're sorry for it, and my mother will forgive you."

There was a deep well-spring in that sincere and simple heart; but Agnes tried to persuade both him and Charlotte, that, considering the state of things at home, it was better she should remain, and try to find bread in the city, at the same time promising to give all the assistance in her power. But Charlotte was afraid to stay in London, and Robert was afraid to leave her; for years of idleness and dependence had left her neither prudence nor energy, and he seemed to consider none of the family safe from under his own eye, and, in spite of all that Agnes could say, back they went to Willowbrook, that careful patient brother, and Miss Charlotte in a fit of repentance too strong to last. And last, of course, it did not, for home was altered for the worse as regarded her: the story had gone abroad, and, as stories always do, in its deepest colours; out of doors, her former acquaintances scarcely recognised her, and the village girls tossed their heads and looked tremendously virtuous as she passed.

Within the cottage, where her reign had been so absolute, she was no longer queen of the family; the elopement had dethroned her for ever, and Mrs. Lacy did not fail to refer to it as cause of humiliation in their household disputes, which now became more frequent, as all the sisters grew to maturity with their narrow means and more limited employment.

This state of things had its natural consequences; poor Charlotte had lost caste; and temptation, now doubly strong, again came in her way, when the lesson of her first folly had worn off, in the shape of a very dissipated officer of the preventive service, who happened to be stationed in the neighbourhood. Robert Lacy once again went in search of his sister, and found her at Dover; but circumstances were not so favourable to his second attempt. Agnes was not there, and Charlotte had grown more fearless; she refused his most earnest solicitations to return; the officer threatened to shoot him; a mob began to collect; and poor Robert, overwhelmed with grief and shame, returned to work for the rest of the family.

Five more years had passed over; it was ten years since Agnes had left her native village, and great changes had taken place in Willowbrook: the old rector slept in the churchyard; his pupils were scattered far in the paths of their various fortunes, and a single young gentleman now occupied the parsonage. The cottage beside the stream was still as richly covered with roses and green leaves, but small children played at its door, on long summer evenings, with more thoughtless faces and gayer garments, than those of the orphans who once inhabited it, and William Walton looked out with a father's eye on their play; but, opposite the establishment of Mr. Selby, who had by a gradual transition, not uncommon in country places, slipped into the grocery line, there stood another shop, far eclipsing in the eye of the villagers the remembered splendours of his early drapery.

It was the hour of the coach, *par excellence*, for Willowbrook knew but one, and its coming was a date in the village day, when, through the mass of millinery which crowded the window of that shop, four young and well-dressed women might be seen keeping earnest watch upon the "Golden Deer," which still remained, though with many alterations and improvements, the principal inn of the village. In front of it there were now assembled a considerable number of persons, but belonging to a more respectable order than those who thronged round the southern stage on the day of Agnes Walton's departure. But the southern stage had shared the fate of all ancient things, for it was now superseded by the Royal Mail; and, as that government chariot stopped at its appointed station, a tall fine-looking woman, to whom hats were lifted, and hands stretched with words of welcome and congratulation, stepped out amid that general attention bestowed on a well-known

and much respected traveller; it was Agnes Walton returning to her native village to superintend the shop already opened under the management of her four sisters, and filled by the proceeds of her ten years' industry.

Mrs. Carleton's children had grown up, and, like the patriarchs of old, both she and Agnes felt they wanted room, and therefore parted in all friendship.

Agnes returned rich in the opinion of her neighbours, and they had waited for and welcomed her. There were her mother's relations, who once could not notice the "tradesman's daughter," but now saluted her warmly with the titles of "cousin" and "niece."

There were the rich neighbours who had scarcely known, and the poor who had assisted, her orphan childhood. Change had passed over many, but there was still one unchanged, who came with the same friendly grasp, the same look of unaltered affection, aye, and the same threadbare coat—and that was Robert Lacy.

Frederic Lently was not there; his father had at last succeeded in marrying him exactly to the old merchant's mind, for the bride was very plain, rather old, and a little ill-tempered, but she had a peerage in her own right. Agnes had never named or seen him since the day of Charlotte's elopement, but it was said that for the last five years the girl's look had grown more sad and serious in the midst of her prosperity. How that prosperity continued we need not particularize, for the interest ceases with the struggle. But Agnes and her sisters rose to fortune they never dreamt of, and their shop was patronized by all the fashionables of Willowbrook, but one after another the sisters left her side, and launched forth on a matrimonial voyage; all the village said they made good matches, for Alice became the wife of the rector; Ellen married Mr. Selby's eldest son; and Mary selected the individual known as "the nice young man" who travelled for the great cap and bonnet warehouse of London; and none was left with Agnes but the fair-haired Elizabeth, whom the young apothecary courted with all his might for the last two years, but she would not leave her sister; yet when we last heard from Willowbrook they said it would be a match.

We know not if any ever spoke in courting strain to Agnes; it was thought she would give no encouragement, and had already begun to call herself an old maid; but daily, as the evening fell, in the same old and well-brushed clothes, and with the same sad and loving look, unchanged through all his fortunes, Robert Lacy took his station in the shop, and enjoyed the long evening conversation with the same relish he had in earlier days at the rose-covered cottage. He was still a hard-working man, but time had lessened his burthen by diminishing the family. Poor Charlotte never ventured back, and all they knew of her after career was that it led to the usual depths of vice and misery.

The second sister was more fortunate, for she married a tradesman, and contrived to keep him so poor by her bad housekeeping, that they had nothing to spare.

Rose, the youngest and merriest of them all, died of a rapid decline, at the age of sixteen. Her next sister cast in her lot with a soldier, whose regiment chanced to be quartered in the village; and Mrs. Lacy, after adding to her beloved tea something of a stronger flavour, by way of consolation, under the many afflictions and downcomes of dignity which beset her latter days, departed this life, leaving to Robert her blessing, and the two plainest and crossdest of the family to support; and it was their special care to see that he should not marry before them. In that matter, indeed, they had little difficulty, for Robert had lost his youth, and his only magnet was found in the shop of Agnes, where there was still a friendly greeting for him, but nothing more.

Readers, the tale of Agnes Walton comes at last to a close. She is still the principal draper and milliner of

Willowbrook; and we trust her story will prove that this world is not so bad a world after all, for it has hope for the humblest, and a way to rise if they only take it. But let us say a parting word to all young ladies, of whatever rank or station:—In any step that involves life's true interests, and still more its duties, hope well, and be prudent—but, DON'T BE AFRAID.

MENDELSSOHN'S "ELIJAH."

THE scholar is wont to contemplate with a reverential admiration the ages, when, beneath the bright skies of Greece, and amid the solemn grandeur of Athens, a nation listened to the harmonies of the Grecian chorus, as it chanted the lofty verses of *Æschylus*, or the thrilling beauties of *Sophocles*. Many a classic enthusiast would gladly renounce the advantages of living in this age, for one day in that ancient theatre, when some sublimely wild strain of mystic music bore aloft the wondrous story of the demigods, and echoed the fragments of primeval traditions to the imaginative Greeks of old. Transported by such emotions, some have attempted to create amongst us an imitation of the Grecian drama, as if the bright forms of ancient mythology could deeply impress those who *know* that the whole circle of the Grecian deities are but beings of the imagination, or only dim representatives of early traditions, now more brightly manifested in the Scriptures. The Grecian drama is for us but a confused echo of the struggling emotions of a past world, to which we may listen with the interest ever associated with all things revealing the smallest portion of man's bygone history; but we have no reverence for its oracles,—for, do they not come from pagan shrines, and are not the once mighty temples now in ruins, and does not darkness cover the mysteries of *Samothrace*,¹ and the caves of *Eleusis*?²

Is there, however, nothing which the Christian can substitute for the splendid classical chorus, and the Grecian recitative? nothing which shall combine the two great essentials of the beautiful and the true? Have we no development of sacred and ancient truths, uttered by the voice of high art, and sounding out stories of solemn grandeur, or touching beauty, in strains of immortal music? What are the magnificent narrative of the "Israel in Egypt," the dramatic power of the "Samson," the wondrous sublimity of the "Messiah," and the varied beauties of the "Creation," but distinct exhibitions of the power of *Christian art* applied to subjects as much surpassing the Grecian mythologies in majesty as in truth?

The solemn Oratorio can effect for us, what the ancient drama, in its religious aspect, accomplished for the more thoughtful Greeks in times of old. We do not intend to institute a close comparison between the classic drama and the oratorio, being sensible of a marked difference in works of such a distinct character; but the *great object* of each is the same,—to develop religious history,—and in this latter character we shall now briefly review the Oratorio of "Elijah." This, the composer, Dr. Felix Mendelssohn Bartholdy, has thrice conducted during last April, at Exeter Hall, before a crowded audience, and once in the presence of the Queen; as thousands of our readers must have been unable to attend these performances, it may be of some use to develop the *spirit* of this oratorio for their information.

(1) This island was the seat of a peculiar worship called the *Cabiric*; it is near the coast of Roumelia, and is now named *Man-drake*, or in some manuscripts *Samothraki*.

(2) A town in Greece where secret rites were celebrated which the devotees were bound not to reveal.

Our object is not a *musical* critique, nor indeed a criticism of any kind at all, but simply an analysis and exposition of the *thoughts* pervading the whole composition. We shall not, of course, attempt to vindicate such performances from the objections advanced by some serious persons, but take for granted their accordance with ancient christian custom,¹ and their uses when properly conducted.

The first part of the "Elijah" opens in a somewhat remarkable manner by a prophetic recitative, in which occurs the prediction of the three years' famine by the prophet. The solemn brevity of the announcement came with a peculiar emphasis to the assembled thousands, who had so recently joined in a fast and supplication against a threatened famine in the year 1847. All seemed to connect the eventful epoch in the land of Israel, more than two thousand five hundred years ago, with something in the condition of Europe now. No prediction from the mouth of a prophet has foretold calamity for us; but the wisest of England's sons were very recently engaged in reading the signs of the past and coming harvest with many forebodings. To such the chorus,—"The harvest now is over, the summer days are gone," came as a remembrancer of the emotions with which sage heads lately looked on Ireland and other parts of the British isles. These thoughts were doubtless also suggested to the Queen and Prince by the mournful opening of the Oratorio, and must have reminded them of the late national fast, in which monarch, nobles, burghers, and peasants had joined.

At this point the Oratorio has but opened the subject; the prediction of the famine has startled the land of Judah, and a nation is presented deprecating the threatened infliction. But the calamity begins to work; and a hundred bright rills which gushed down Judea's mountains, rippled by the gnarled roots of ancient cedars on the slopes of Lebanon, and shed their soft beauty over valleys consecrated by memorials of a holy past, - are all dried up, and desolation is placing her sombre mark on once happy villages. This condition of the land is brought before the audience by recitative chorus, beginning with "The deeps afford no water, and the rivers are exhausted." The composition now advances into the narrative, and hints with solemn words and suggestive music, another element in the condition of suffering Israel. Our attention is called from physical to spiritual evils; from the melancholy and woe-stricken cities, in the streets of which the laughing music of childhood's voice is heard no more, to the gloomy groves where stand in ominous splendour the altars of Baal, and the priests of the host of heaven. The planets shed their soft light from their far-off paths on those dark waving trees, and the moonbeams gild, with a pale splendour, the horns of those foliage-veiled altars; but thence rises the plague which now overshadows the land. The sin of idolatry has degraded the people, and called down upon the tribes remedial punishments. This fact is suggested by Mendelssohn in the recitative opening with "Ye people rend your hearts, forsake your idols." The composer has not, however, left the audience to suppose that a *whole* people have lost their ancient faith, and forgotten the marvels of their early history; and, therefore, the voice of gentle hope is heard breathing sweetly in the soft beauty of the air, "If with all your hearts ye truly seek me." Like a voice from the watching angels does the promise float along over those polluted groves of Baal, the incense of which seems to rise like a penitential smoke towards heaven. But these gleams of hope on the horizon, like summer light in the west when night is deepening, are not sufficient to dispel the horrors which rest on Israel's prince and people; the sin is not yet passed away, and, therefore, the calamity spreads. We accordingly next hear the melancholy forebodings of those Jews who saw both the depth of the national degradation, and the necessity

of a strange catastrophe to rouse the slumbering elements of goodness in the subjects of Ahab. The night of suffering is only beginning; and these emotions are expressed in the chorus—"Yet doth the Lord see it not." The nice perception of that mingled good and evil which so constantly complicates the workings of society, has been exhibited by Mendelssohn in the union of gloomy anticipations with hopes of distant good, with which this chorus closes in the words,—"His mercies on thousands fall."

Thus great painters ever portray men; making them, not all demon, nor all angel, but a strange admixture of the two, so that the terrible and the beautiful are often in immediate contact; as in a thunder-storm the lightning flashes over soft and peaceful valleys, whence the perfumes of a thousand wild flowers rise. The oratorio now leads the audience first to view Elijah, in his solitude by the brook Cherith, where, within sight of troubled Jerusalem, he gazed in deep thoughtfulness on the slow ripple of the waters as they descended to the Jordan. But soon the river sinks in its channel, and the brook becomes a parched-up hollow. The prophet then departs to Zarephath; where, far from the metropolis, he may meditate on the glories of the past, and transmit to an unknown widow of Asher's tribe, wondrous gifts from God. From the silent Jordan to the melancholy sounding sea the graves are opened; but in one lone house of Zarephath the powers of the invisible world are revealed in miracles, like those of olden days. Such startling contrasts between the vastness of national woe, and the happiness of one favoured circle of beings, no music will ever fully exhibit; but all that a spiritual and high toned art could effect was done by Mendelssohn, in this portion of his composition, to develop the supernatural grandeur of the subject.

The performance now begins to concentrate its powers on the great event which once struck a whole people with awe, and through long ages displayed the brightness of the avenger to the startled eyes of idolaters. Elijah is brought before us uttering that sublime challenge to the priests of Baal, which is *now*, even to the imagination of the purely intellectual man, a development of such moral grandeur as beams upon the earth only at intervals of a thousand years. We are accustomed to discourse on the power of truth, and chaunt forth our "*Magna est veritas, et prevalabit*," but with all this we are strangers to *great* contests, and know little of the granite-like endurance required by accumulating dangers. Elijah calmly summons the priests of Baal to a trial of their mission before their own altars. The bold confidence of the prophet when, gazing upon the woods and mountains of Carmel, he utters in the musical harmonies of the oratorio—"Invoke your forest gods and mountain deities," - prepares us for the strains of alternate grandeur and beauty which speak alike to ears and hearts. Then follows that magnificent chorus in which the priests of Baal are represented invoking the object of their wide-spread superstition. The words "Hear, mighty God; Baal, oh, answer us!" are given with a power which attests the composer's perfect conception of the fierce spirit of fanaticism in those doomed hierophants of an imaginary God.

The sacred irony, with which Elijah attempted to recall the maddened idolaters to a feeling that all they trusted in was false, is nobly developed in the recitative, "Call him louder, for he is a God." We see the excited priests, who had risked their power in one daring attempt to confront Elijah, whirling in fanatic dance around the altar, cutting their bodies, and gazing at intervals into the tranquil sky for the appearance of the fire; we hear their wild outcries to the God of the power of the air, as with diminishing hope they make the mountains echo with "Hear and answer, Baal! Mark how the scorner derideth us." But the last wail of the idolaters is over, and the hush of deep expectation now suspends the breath of the host grouped round the steep of Carmel, as the heaven-commissioned pre-

(1) The public exhibition of sacred narratives can be traced for a period of nearly fifteen hundred years in the Christian Church.

phet, with the calmness of celestial power, approaches the altar. The quiet grandeur of such a spectacle is impressively suggested by the recitative, in which the assertor of eternal truth to a fallen people is supposed to summon the congregated tribes of his nation to witness the fall of the avenging fire, now about to annihilate the haughty insolence of a pagan priesthood. The power of the scene is increased at this moment by the quartett representing the gentle voices of angels, the soft musical whispers of the seraphim floating through the still air, and suggesting lofty thoughts of that sympathy which the invisible spirits take in the history of earth.

The subject now changes, and a bold strain of choral music brings before us the descending fires, the triumph of the prophet, and of all who had stood in such perilous times near the storm-beaten banner of the truth. A series of recitatives, airs, and choruses prolong the grandeur of the decisive victory just obtained over the powers of paganism, the arrogant priests of which perish by the indignation of a people whose understandings and imaginations had been long fast bound in the miseries of darkness and superstition.

We must not be drawn from the narrative of the oratorio by speculations or reasonings on the destruction of Baal's prophets, whose total ruin might be proved absolutely necessary for the highest interests, not only of Israel but of the world. We cannot however refrain from once more surveying these marvellous events as developed in the music of Mendelssohn.

We have here no space for criticism on the *technical* excellencies of the composition, our object being rather to develop the *idea* of the oratorio, than exemplify its artistic merits. All must have been impressed by the rare felicity with which the composer illustrated the great and diverse events which on that memorable day struck with terror or amazement the heart of a nation. The despairing agony of the false priests; the sublime confidence of Elijah; and the sympathy of the glorious who tabernacle round the world, are all displayed to the imagination of the hearer, who is for a time endowed by such music with a species of supernatural vision, by which he pierces the mists of ages, and beholds the distant Israelitish people of a thousand ages past.

The first part closes with the miraculous fall of rain which descends on the parched dales, where no lilies of the valley have of late appeared, and sounds most musical amid the myriad leaves of Carmel's groves. The gathering of the clouds, the heaving of the sea, and the commotion of the heavens, rush upon the ear in the nicely adapted music; whilst the five hundred chorus singers sustain the imagination of each hearer in the "Thanks be to God! he heareth the thirsty land! The waters gather," &c. This scene ends in a grand strain of magnificent beauty, disclosing the fallen altars and disgraced temples of Baal, whilst the true and the faithful sons of Israel stand exalted amongst the repenting crowd.

The second part opens with gloomy forebodings, and remonstrances with the powers of evil, which still rule the palaces of Israel. The mighty signs from heaven have not bowed the heart of Ahub, and already the desire of revenge has fired the vindictive monarch, who mourns over the absent rites of Moloch, and the ruined worship of Baal. A recitative and chorus, in which the wretched Jezebel and her flatterers join in execrating Elijah, illustrate the perils of the prophet. This part will recall to the classical scholar the structure of the ancient Greek chorus, in which some speaker utters his thoughts to a chorus as the representatives of the nation, and these again in responsive strains re-echo the dark sayings of the speaker. Thus the chorus in the Elijah sympathize with the pagan queen, and utter, in the words "Woe to him, he shall perish," the full concentration of the malice with which the demons regard the spirits of the blessed. Elijah retires from the fury of his

enemies, and almost despairing of the triumph of truth, utters his mournful soliloquy in the desert. The idea now suggested by the oratorio is this, "Elijah is left to the solitude of the wilderness, man has deserted the prophet, and Israel is even yet willing to restore the prostrate altars of Baal." But the apostle of truth is not alone, the air around utters sounds of life, and reveals unnumbered spiritual intelligences; the souls of ancient prophets and of patriarchs unite with that other host of unknown beings, called angels in human speech, to support the prophet. The beautiful trio, "Lift thine eyes to the mountains whence cometh help," shed a soft influence over the audience, and enriched the imagination with a gently flowing stream of celestial images. This part is well placed in the oratorio, for it precedes the journey of forty days to Mount Horeb, and thus shows the source whence Elijah derived his supernatural strength. To realize this portion of the composition, it is essential to carry our minds far back, through all the tumults and changes of many ages, to a period when *supernaturalism* existed visibly before men, and miracles were constantly revealing the mighty powers now resting behind the machinery of general laws. This mysterious condition of the ancient earth, at least in Judea, is repeatedly forced upon the attention in the "Elijah," where the spirits of a higher abode are supposed to be brought into constant communication with man. Upheld by such influences the prophet passes to Horeb, the grand supernaturalism of which is suggested by the chorus, "Behold, God the Lord passed by, and a mighty wind rent the mountains round - and the earth was shaken; but yet the Lord was not in the earthquake. And after the earthquake there came a fire, and yet the Lord was not in the fire; and after the fire there came a still small voice; and in that still small voice onward came the Lord." The elemental commotion, and the sublime quietude succeeding, whilst the mysterious voice speaks, present a contrast of solemn grandeur and heart subduing stillness. The majesty of the oratorio rises to the full height of the sublime, as we remember that such events did *really happen* at a certain hour of a certain day in Mount Horeb; when, after the Arabian wilds had heard the roar of the rushing tempest, *that voice* broke on the ears of a man resting in the entrance of a small cave, with covered face and prostrate form. The quartett, "Holy, holy, holy is the Lord," appropriately follows such a manifestation of super-mundane power; after which lofty recitatives, airs, and choruses, proclaim the triumph of the heavens, and the joy of earth.

Mendelssohn then images the final event in Elijah's earthly history, his translation from earth, which the words of a powerful chorus assist our imagination to contemplate as the ascending prophet disappears veiled in brightness. As this closed Elijah's ministry, so does the illustrative chorus terminate the true action of the oratorio. The concluding airs, recitatives, and choruses, do but form a graceful close to the sacred epic, and serve to prolong, in gentle re-echoes, the impression already produced.

One decided merit in the composition is its harmony with the spirit and meaning of Elijah's actual history; whilst much that must be *imagined* to have accompanied such events is *suggested* with that lofty ideality appropriate to such a theme. To say that *all* the grandeur surrounding the ministry of Elijah is brought out by Mendelssohn, would be too high praise for human skill to merit; for, on every side of such great facts, numberless images of the sublime float, which chide all the efforts of the intellect to give them a distinct and picture-like form. But it may be safely affirmed that the composer has aimed high, and generally succeeded in attaining his object; and higher praise cannot be given to Handel or Haydn, with whom Mendelssohn may justly hope to stand, in the temple which shall be raised by coming ages to the memory of genius.

Poetry.

[In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.]

A SKETCH FROM LIFE.

BY CHARLES HAINES GUNN,

(Author of "Dearly Hallowed.")

How bright is summer oft portrayed in life's first op'ning spring,
When hope paints prospects lovely, and when, trembling on the wing,
The soul pursues her mystic flight, through many a dreary maze;
Or led, as by a meteor false—a bright, delusive blaze!
Keenly the heart will feel the wound, by cherished hopes undone!—
How quickly clouds will gather o'er the glory of the sun!

Thus 'twas with thee;—thou didst not look on hopes as passing shades;—

Anticipation often calls the flower that soonest fades!
When doting on futurity, so beautiful and fair,
Thou didst not think thyself a prey—thy foe was in his lair!—
When future bliss enwrapt thy soul, how little didst thou deem
Thy happiness a phantom, and thy bliss a passing dream!

How calm the ocean, hushed the wind! when o'er the crisped wave

Thy little barque skimmed gallantly—to bear thee to thy grave!
At length, at length, the angry blast of hurricane swept o'er,
And here thou art, a wreck, compared to what thou wert before!
How distant from thy heart the thought, that so serene a form
Should ere be roughened by the wind, or maddened by the storm!

He digs in vain for happiness, who digs in earth's gross mines,
Who grasps at tinsel'd gauds, forgets "All is not gold that shines!"

Mysterious dream! it is not *here* bliss is allowed to dwell,
Its shadow proves its utmost charm—deception's in the spell!
Sorrow may cast an angel's shade, we grasp, but grasp in vain,
For unsubstantial joys precede substantial grief and pain!

Yes, such is life; but cease to weep, although thy heart must feel
The rankling of the barbed shaft, the lancing of the steel.
Fair flowers of bliss which deck our path, how soon they cease
to bloom!

And summer bright is quickly chased by winter's dreary gloom;
And oft, alas! one hour will blast the hopes of many years,
Though buds may promise blooming joys, they often blossom
curse!

As children at the mountain's base will often gaze on high,
And fondly deem the skies thus pierced, hide *Heaven* from the eye,
And climb its steep in hopes to find upon its hidden height
That blissful place, but find it still as distant from their sight,
Thus didst thou innocently gaze, and climb life's giddy steep;
Thy bliss was all delusion!—thou art left alone to weep!

The garland's withered on thy brow, and from thy cheek is flown
The roscate beauty of thy youth;—unknowing and unknown!
The lightning flash from blackest clouds has struck thy beauteous
form,

And thy horizon, once so bright, is darkened with a storm!
The beauty of the spring is gone, thy summer, too, has fled,
Thy winter comes,—he brings thy shroud,—he comes to mourn
thee dead!

The wild caprice of traitor man oft blasts the bloom of youth,—
Oft momentary smiles repay fond woman's love and truth:
Coiled in the hooded bower lies hid the viper,—neath a smile
May lurk the foul design of man—the garb of many a wile!
Though thou didst drink ambrosial drink, yet in the self-same cup
The poisonous aconite was mixed, and thou didst drink it up!

Oh, were I but an angel, and from Heaven could bring thee bliss,
Or bear thee on my wings away from such a world as this!
If supplication could prevail, thy beauty should return,
And thou shouldst be that happy bride—the bridal gift's an urn!
For blighted hopes of future bliss are stamped upon thy brow,
And spectres of false joys deride and mock thy bitter woe!

Oh, could I stand upon yon rock, the monarch of life's ocean,
And throw a calmness o'er its breast, thus still its wild commo-
tion!

And with my breath disperse the clouds, and bid the tempest cease,
And hold the hurricane that sweeps, and change thy storm to
peace!

But, no, alas! it cannot be; time's curtain now must fall,
Death comes to end this chequered scene, and spread thy funeral
pall!

VILLAGE LYRICS.

NO. II.—THE PATRIARCH.

W. BRAILSFORD.

NINETY years have passed and gone,

Ninety years have fled,
Since the balmy sun first shone
On that aged head.

Still he lingers near the spot

Where his kinsmen lie,
As he would not be forgot
In their company.

"One, two, three," he counts each grave

As he totters by,
Seeming he would like to crave
Something ere he die.

"One, two, three,—aye, there, beneath

Where those blossoms fall,
Let me be alone with death,
Sweet flowers over all."

As a withered oak doth stand

When its glories fade,
Waiting for the woodman's hand,
In some forest glade;

All around his branches sere,

Howling in wild glee,
Wanton winds come trooping near,
Yet unmoved is he;

So the busy urchins come

With their merry words;
Some to call the old man home,
Some like mocking birds;

In a mimic state they go

Slowly on his path:
Much they marvel he should show
Neither fear nor wrath.

But he heeds them not, his heart

Dwells upon the past;

He hath memories apart

That he hopes will last

Till the grave hath closed o'er,

With its shadows dim,

And he hears the sound no more
Of the Sabbath hymn.

Sinks the sun in golden state

Slowly in the west,

And the linnet seeks her mate

In their leafy nest.

The bell in solemn tone is rung—

Doth the old man hear?

Knows he not that warning tongue

Hath a meaning dear?

GREAT EVENTS FROM LITTLE CAUSES.

In wandering through the "highways and byeways" of history, how curious it is to seek out the springs which set the world in motion, and to read how the most trivial circumstances have occasioned the subversion of empires, and erected new ones in their stead; in a word, how the most important events frequently came to pass from very inconsiderable causes. A few instances, "though at random strung," may be interesting.

The story of Semiramis shall be our first instance. How this beautiful heroine, by her charms and her valour, won the heart and crown of Ninus, King of Assyria, history doth tell. Enamoured of his bride, one unlucky morning, he resolved on the pleasure of seeing all Asia subject to the will of one who had possession of his heart: he, therefore, gave her absolute authority for the space of one day, and ordered all his subjects to execute the commands of Semiramis. A wise and prudent woman would, doubtless, have made use of this frolic to tell Ninus of his faults; not so, however, Semiramis; she consulted her ambition and her cruelty, for as soon as Ninus had placed this power in her hands, she employed it in causing him to be assassinated. The traitors whom she employed for this vile purpose, reported that the king had given up the reins of the empire to his wife, because he found his end approaching; this the people believed, and readily acknowledged Semiramis as their sovereign. How she used her newly-acquired power by building the city of Babylon, employing two millions of men; how she extended the Assyrian empire by levelling mountains, turning the course of rivers, and building vast cities; and how she failed in her attempted conquest of India, and was, in consequence, privately put to death by her son Ninas, history doth narrate: we have told enough to prove how a little cause produced a great effect.

Agessilaus, when in the flush of conquest, was one day suddenly seized with the cramp in his left leg, which caused him great pain. "Men thinking that it had been but blood which filled the vein, a physician being there, opened a vein under the ankle of his foot, but there came such abundance of blood that they could not staunch it, so that he swooned often, and was in danger of present death. In fine, a way was found to stop it, and they carried him to Lacedæmon; where he lay sick a long time, so that he was past going to the wars any more, and thus Lacedæmon lost her hero.

"In most naval fights," says Sir Thomas Browne, "some notable advantage, error, or unexpected occurrence hath determined the victory. The great fleet of Xerxes was overthrown by the disadvantage of a narrow plain for battle. In the encounter of Diullus, the Roman, with the Carthaginian fleet, a new invention of the iron cornet, (beaks to the ships,) made a decision of the battle on the Roman side. The unexpected falling off of the galleys of Cleopatra lost the battle of Actium. Even in the battle of Lepanto, if Carneseo had given the Turks orders not to narrow on account of the number of the Christian galleys, they had in all probability, declined the adventure of a battle; and even when they came to fight the unknown force, an advantage of the eight Venetian gallies gave the main stroke unto the victory."

Archimedes, we know, set fire to the ships of Marcellus at a considerable distance, by burning-glasses; and this philosopher, who had offered to move the world with a lever, was taken off in a very unseemly manner; for he was killed by a soldier who knew him not, while intent upon some geometrical figures, which he had drawn upon the sand.

Rome, in its foundation by the twin-brothers, Romulus and Remus, saved from the torrent of the Tiber; and the preservation of the capitol by the cackling of geese, are examples of great effects from little causes,

too familiar to need quotation in detail. The founding of Carthage by Dido, is a kindred event; for the cunning colonist, to escape the cruelty of her brother Pygmalion, put her goods and chattels on board ships, and sailed in quest of a new settlement; having landed on the African coast, Dido is said to have bought from the natives as much ground as she could encompass with a bull's skin. In this transaction she evinced both ingenuity and mathematical skill, for she not only cut the skin into very small thongs, but, after joining them, laid them in the form of a circle, a figure which encloses the largest space by the smallest bounding line. On that ground she built Carthage, one of the most celebrated cities of antiquity. The latter part of this account has been disputed, but it has often been quoted as authentic history.

The fall of Lucretia was the cause of the expulsion of the kings from Rome, and the change of the monarchy into a republic; and the licentious passion of one of the Decemviri, (Appius Claudius,) led to the abolition of the Decemvirate, as is told in the touching story of Virginus and his daughter.

The conspiracy of Catiline was defeated through the disgust of Fulvia with her lover, Curtius, when he could no longer heap presents upon her. Curtius, who was one of the conspirators, had "in moments of confidence," told the plot to Fulvia, who spread it abroad; it soon reached the ears of Cicero, who discovered it to the Senate: Catiline fled from Rome, and took up arms; he was pursued; overtaken; a battle ensued, in which he was killed, and thus Rome was saved by the betrayal of a woman's secret, from one of the most powerful combinations ever formed for the overthrow of the Roman state. The ugliness of another Fulvia was the cause of a civil war between Anthony and Octavius; for Octavius rejecting the suit of Fulvia, and declaring that her ugliness terrified him more than death, the indignant woman led the Roman soldiers against him, and set the two Triumviri fighting.

Titus Antoninus was raised to the throne of the Cæsars through his affection for his father. The emperor Adrian one day saw Titus leading the infirm old man to the Senate; he instantly adopted him, and after the death of Adrian, Titus ascended the imperial throne.

Commodus, another emperor, of a very different stamp, was killed through a child playing with a paper which he had found in the emperor's chamber; the little boy had been reared in the palace, had followed Commodus into his apartment, and staying there after his departure, took up the paper, and went out of doors, playing with it as he walked through the street; the child was met by a woman, who, taking the document out of his hand, found it to be the sentence for her own death, as well as some other persons; they together saved their own lives by first poisoning, and then strangling the imperial tyrant.

Belisarius, one of the greatest captains in history, after having conquered the Persians, and subdued Africa and Italy, was deprived of all his honours and dignities for having very properly reproached his worthless wife. She being a confidante of the empress, persuaded the latter to get up a charge of revolt against Belisarius, and then instigated Justinian to confiscate the soldier's estate and goods, and degrade him. "Before Belisarius's disgrace," says the account, somewhat naively, "every person thought it an honour to be in his company; but, after his misfortune, none dared to speak to him, compassionate him, or even mention his name. True friends are rarely met with among the great."

Placidia, the mother of Valentinian III., Emperor of the West, brought up her daughter, Honoria, so severely, that the young princess, who was a forward vixen, to get rid of the maternal restraint, wrote a letter to Attila, King of the Huns, offering him her hand, and as a pledge of her faith, sent him half a ring. Attila, who only wanted a pretext for ravaging the

west, took advantage of Honoria's offer, and wrote to the Emperor Valentinian, that Honoria was his wife; desired that he would send her to him, and likewise cede to him the moiety of the empire which was to be her portion. Valentinian, of course, refused these unreasonable demands, which so enraged Attila, that he ravaged all Gaul and Italy, and drove some of the inhabitants of the latter to the point of the Adriatic Gulf, where they built themselves cottages, and thus commenced the city of Venice.

Valentinian III. was a reckless gambler, and whilst Rome was falling to pieces for the second time, this emperor was playing at dice with his ministers, and cheating them whenever he could; and Maximus preserved the friendship of this weak emperor only by gaming with him. One day, when they had both played very deeply, Maximus lost a considerable sum; and, as he had not the amount with him, the emperor compelled him to leave his ring with him as security. Through the base use which Valentinian made of the ring, he was assassinated in a conspiracy formed by Maximus, who succeeded to the imperial throne, and then compelled Eudoxia, the widow of Valentinian, to accept his hand. She soon became disgusted at his cruelty, and invited the Vandals from Africa to come to her aid; Genseric caught at this opportunity of gratifying the desire he had of pillaging Italy: he soon landed with a large army, advanced to Rome, and entered the city, sword in hand, and pillaged it for fourteen days. He then returned to Carthage, carrying with him the Empress Eudoxia, and all the principal personages of Rome, loaded with chains; in the mean time, the people, enraged at Maximus, tore him to pieces. Thus we see how the inability of a gambler to pay a loss immediately led to the sacking of the mistress of the world.

Many a war has been caused by the most trifling circumstance: here is an instance. About the middle of the thirteenth century, the two republics of Genoa and Venice were at the height of their prosperity, and had establishments in all parts of the world. They had a considerable one in the city of Acre, on the coast of Syria, where they lived, subject to the laws of their respective countries, in perfect union. Their peace was, however, destroyed by a mere accident. One day, two porters, one a Genoese, and the other a Venetian, fell out about a bale of goods which was to be carried. From words they fell to blows: the merchants, who at first gathered round them only by way of amusement to see the battle, at length took part in the quarrel, each assisting his countryman; and much blood was spilt on both sides. Complaints were soon carried to Genoa and Venice; and the magistrates of each republic agreed that satisfaction should be made for the damage, by arbitration. The Genoese had the greater sum to pay, which they failed to do; when the Venetians, by way of retribution, set on fire all the Genoese vessels which were then in the port of Acre. A sanguinary battle ensued; and the account says, Genoa and Venice resolved to support their merchants, and each fitted out a considerable fleet; the Genoese were beaten, and compelled to abandon their settlements at Acre, when the Venetians rased their houses and forts, and destroyed their magazines. The Genoese, irritated at their defeat, refitted their fleet, and every citizen offered to venture his person and fortune to revenge the outrage on his country. Meanwhile, the Venetians were equally active. The sea was covered with the ships of the rival republics; an engagement ensued, much blood was spilt, and many brave citizens were lost on both sides. In fine, after a long and cruel war, in which the two republics reaped nothing but shame, they made peace.

Towards the middle of the fourteenth century, the Genoese became disgusted with the tyranny of the nobility, and sighed for change. The populace wished to elect an *Abbe*, whose authority should keep in check the captains, who were then the magistrates of the

republic. A large and tumultuous meeting was accordingly held for the election of an *Abbe of the People*. The tumult increased, the people grew warm, and were about to proceed to blows; when a shoemaker, who had just come out of a wine-house, mixed among the crowd, and getting upon an elevation, emboldened by the fumes of wine, he bawled out, "Fellow-citizens, will you hearken to me!" The Genoese, who were about to tear each other to pieces, burst into a hearty laugh. Some told the shoemaker to be quiet; others encouraged him to speak; but some threw dirt at him. The orator was nowise disconcerted, and shouted out: "You ought to nominate to the dignity of *Abbe of the People* an honest man; and I know of none more so than Simon Boccanegra; you ought to appoint him." Now, Simon was a good man, and was much esteemed both by the nobility and the people; and he was, moreover, a man of good family. In short, his merits occasioned the people to attend to the shoemaker's recommendation: they elected Simon to be *Abbe*, and presented him with a sword, as the mark of his dignity; this, however, he returned, thanking the people for the goodwill they had shown him, but declining to be the first *Abbe*; but, availing himself of the shoemaker's speech, he soon attained the lead in the republic. The people soon shouted, "Boccanegra, Lord of Genoa." The ambitious man then said he was ready to submit to the will of the people; to be *Abbe*, or *Lord*, as they should ordain. This feigned humility pleased the people, as he had calculated; they shouted, "Lord Boccanegra!" and he was proclaimed perpetual Doge! So that, the speech of a drunken shoemaker caused the government of Genoa to be transferred from the nobles to the people, and a single man to become sole master in the state.

How the Genoese fell under the Austrian yoke we need not particularise: they freed themselves from it through a very trifling occurrence. On Dec. 5, 1746, the Genoese were compelled to assist in drawing the artillery of their city, to aid their conquerors in an expedition against Provence. In drawing one of the mortars through a narrow street, the carriage broke; a crowd assembled, in the midst of which an Austrian officer struck with his cane a Genoese, who was slow at his work. The exasperated republican drew his knife, and stabbed the officer; the whole crowd of Genoese became excited; they broke open the armourers' shops, demolished the gates of the arsenal and of the powder magazines, fell upon the Austrians, and drove them out of the city; the peasantry poured in, and joined the citizens, and thus they drove the enemy entirely from the state of Genoa. The Genoese celebrated, with great rejoicing, this recovery of their liberty: with great solemnity they drew through the streets the mortar which had occasioned this revolution. The Austrian army, destined for the expedition against Provence, marched to, and blocked up, Genoa; but France sent the citizens aid—the Duke de Richelieu saved the republic, and the senate erected a statue in honour of him.

A window was once the cause of a war, and very oddly, too. When the palace of Trianon was building for Louis XIV., at the end of the park, at Versailles, the king, one day, went to inspect it, accompanied by Louvois, secretary at war, and superintendent of the building. The sovereign and the minister were walking together, when the king remarked that one of the windows was out of shape, and smaller than the rest: this Louvois denied, asserting that he could not perceive the least difference. Louis had it measured, and finding that he was right in his observation, treated Louvois with contumely, before the whole court. This so incensed the minister, that when he reached home he was heard to say he would find better employment for a sovereign than that of insulting his favourites: Louvois was as good as his word; for by his haughtiness and ill-temper, he insulted the other leading powers of Europe, and occasioned the sanguinary war of 1689.

between Louis on the one side, and the Empire, Holland, and England, on the other. The treaty of Reykwick, in 1697, terminated the war, by which Louis gained nothing, acknowledged William III. as King of Great Britain, and restored the Duke of Lorraine to his dominions.

These, we may observe, for the present, are but a few of the historical instances of "Great Events from Little Causes."

SKETCH OF THE TRADITIONS OF GERMANY.¹

But all the ruined fortresses, all the grey turretted castles, which rise upon the picturesque banks of the Rhine, the tops of Thuringerwald, the mountains of Silesia, do not record a tale of unhappy love. There are some pointed out by tradition as the abode of malignant spirits, and before which the credulous children of Germany make the sign of the cross as they pass. The people of the middle ages delighted to idealize the memory of princes who had dealt kindly and bountifully with them, but they marked out by a poem or a story the name of tyrants for execration. This was their only vengeance. They repaid themselves for all the exactions they had suffered,—all the tears they had shed,—all the blood they had lost, by a legend. Like the Egyptians, they tried the man after his death; they summoned him to their formidable tribunal, and condemned him in their popular songs,—in their fire-side tales—to endless remorse. Here the greedy baron, who his whole life long has been plundering his subjects, is doomed to toss with cries of agony on a couch made of the gold he has unjustly amassed. There the murderer stalks along, for ever pointing to a bleeding wound in his breast. And here, again, he who has despised the complaint of the poor widow,—the tears of the orphan,—comes back at midnight to implore the prayers of the children of those once his victims.

In Bohemia, the ruins of the Castle of Kynast are pointed out to the traveller, and the following strange tale related:—"The lord of this castle had only one daughter, named Cunegonda, to whom, when dying, he bequeathed all his property. Cunegonda was beautiful, but of harsh and haughty disposition. When her father's old retainers entreated her to choose a husband, she led them to the top of a precipice, to the summit of a rock so steep that the bravest amongst men could not put his foot upon it without trembling, and she said, 'He who hopes to be my bridegroom must boldly ride to the top of this beetling crag, and I swear by all that is sacred never to betroth myself to any who will not dare attempt it for my love.' Many knights adventured the fearful risk, but all failed. Some were lured by the beauty of Cunegonda, others were prompted by ambition, or by an absurd vanity, and the pitiless maiden, with equal indifference, saw perish those who loved her truly and those whom interested views led on to tempt their fate. One day, three new knights came to dare the enterprise. They were three brothers; all three young, handsome, brave; they attracted every eye, and the crowd followed them with ardent wishes for their success. One after another they essayed to climb the fatal rock. The first had hardly got half way when his horse made a false step and threw him into the abyss; the second failed a little higher up; the third advanced more cautiously, and already had he surmounted the principal difficulties, already was he near the top, when suddenly a dew-moistened plant made his feet slip, and he rolled from rock to rock into the yawning gulph beneath. Cries of horror burst from the

people at the cruel sight, and even Cunegonda for an instant felt a touch of pity. But soon she resumed her haughty indifference, and continued to behold, unmoved, the fate of all whom that bloody rock deterred not from the contest. One morning, the sound of trumpet announces a fresh arrival. A knight enters the castle, his armour is dazzling in its brightness, an eagle's plume nods from his helmet, and his long black hair falls low upon his shoulders. He is handsome, far handsomer than all that had preceded him. Proud was his look, majestic his bearing. As she gazed upon him, Cunegonda felt a thrill of fear and love before unknown to her. When he announced to her his desire to scale the mountain, she turned pale, she trembled; glad would she have been to have forbidden the attempt, to have twined her arms around him, and to have vowed to him eternal fidelity. But he was determined to attempt the perilous journey. Already is he on his way, climbing by the hair-breadth path from crag to crag, from peak to peak. Cunegonda follows his course with eager, anxious eye, reckoning his every step, his every peril. When she sees him advancing as yet unscathed, standing erect upon the most precipitous ledge, her heart beats high; she lifts her eyes to heaven, she prays, she hopes, then the next instant relapses into despair. Meanwhile, her knight pursues his way, onward and upwards, till at last he wheels his noble horse on the topmost peak, and his plume waves above the abyss. At this sight, Cunegonda falls upon her knees, and the air resounds with her cries of almost frenzied joy. She now rushes forward to meet the stranger knight. But he repulsed her with the most loathing contempt, 'Hence, vile wretch!' said he, 'begone from my sight, thou tigress, who hast been the cause of so many tears! Dost thou remember the many noble knights thy cruelty has slain!—Dost thou remember the three young brothers whom thou didst behold with pitiless eye perish one after the other! I am come to avenge them. Thou lovest me,—I loathe, execrate thee.'

"With these words he left her; and the unhappy Cunegonda, a prey to disappointed love, to torturing remorse, flung herself headlong from the precipice down which had been hurled so many victims to her insensate cruelty."

This legend of Cunegonda forms a striking contrast to all the other love-tales of Germany. In almost all, love appears meek and tender, faithful and devoted, growing up like a flower silently budding forth, expanding in solitude. The maiden devotes herself to him whom she loves, takes him as her protector, as her lord, is bound up heart and soul in his destiny. He suffers, she suffers with him; he commands, she obeys; he returns wounded from the battle-field, she dresses his wounds and tends his couch with unremitting care; he leaves his country for knightly emprise, she retires from the world to pine for his absence many a long year,—to ask of every passing wave, of every flitting cloud, if they have not seen her love, if he will not soon return.

Near Hirzenach are the remains of two castles, the abodes of two brothers. They had been brought up with a young orphan girl, and both loved her with the same ardent passion. When she was of age to marry, they both offered themselves to her, and implored of her to choose. The young girl durst not avow a preference, but the eldest, thinking he had discovered that his brother was the most favoured, generously abandoned his claim, and left the country. The second was desirous of visiting the Holy Land before his marriage, and, some years after, it was reported that he had returned to Germany, bringing back with him a young Greek maiden as his betrothed. These tidings soon reached the elder brother, and, indignant at this desertion of her whom he had so long loved, and whose memory he still fondly cherished, he challenged him to single combat, determined upon vengeance. The day was fixed. The two brothers met midway between their respective castles; their swords were already drawn, and they were

(1) Concluded from p. 131.

rushing upon each other in fratricidal rage, when suddenly the maiden threw herself between them, and with soft pleading looks, and earnest, yet gentle words, succeeds in appeasing their fury. Instead of deadly conflict, they meet in brotherly embrace, and swear eternal friendship. Without one reproach to him who had betrayed her, she who had reconciled them retired to a neighbouring convent, to weep, to pray, to die.

Another tradition I would not willingly omit. A knight of Lorraine, named Alexander, sets out for the Holy Sepulchre. His wife gave him as her parting love-gift a white vest, upon which she had embroidered a red cross. "Take this," she cried, "and wear it ever, for my sake. It is the symbol of my devoted constancy,—no stain can ever rest upon it." The knight is taken prisoner by the Saracens, sent to the Sultan, and condemned to draw the plough. Through all his labours he ever wears his vest, and neither rain nor dust, neither mire nor blood, could imprint upon it a single stain. It was white as the day upon which he took it from the hand of his young wife. This marvel was observed, and told to the Sultan, who sent for the prisoner, and asked him how he became the possessor of this wondrous vest. "It was the gift of Florentina, my wife," said Alexander, "the token of her stainless faith." The Sultan dispatches a trusty embassy to Metz, with orders to employ every means, every art, to seduce the devoted Florentina. But promises, presents, adulation, all were alike vain, the young wife remains insensible to the gallantry of the Saracen. A short time after, she assumes a pilgrim's habit, and, with harp in hand, she goes from shore, till at last she reaches Palestine, and the country where her husband is a captive. She gains entrance into the palace, and so deftly does she enact the minstrel's part, that the Sultan, caught by the sweet sounds of her voice and instrument, desires her to name the guerdon she would have. She asks the liberty of a prisoner, makes choice of her husband, and without making herself known to him, takes with him the road to Metz. When within two or three days' journey of the city, she says to her companion, "I am now obliged to leave you. There is your way, and here is mine. In return for the service I have rendered you, I ask only a piece off your vest." The knight readily gives it to her. She takes the shortest road, arrives at Metz twenty-four hours before him, resumes her woman's garb, and, when her husband appears, receives him with every mark of joy, and with as apparent surprise as if she had never seen him since his departure. But the friends of Alexander are not slow in communicating to him the suspicions excited in their minds by her long absence, and her concealment of where she had been, and how she lived. The knight is inflamed with jealousy, and he summons his kinsmen and his friends, and there, in solemn assembly, he demands of his wife an explanation of her conduct. Florentina asks permission to leave the hall for a few moments, and she soon re-appears in the pilgrim's robe, her harp slung upon her arm, and the fragment of the vest in her hand. The knight recognises his beautiful deliverer, and falls at the feet of his loving wife.

A striking feature in all the German legends is the homage paid to beauty. Wherever it appears, whether in a legend or in a popular ballad, it carries all before it; it levels all distinctions. A daughter of the people it raises to the rank of the noble. Men proudest of their birth court its smile—kings rise up to do it honour, as the Trojan sages before Helen. So great is its ascendancy that the people attribute it to magic influence, as in the story of Lore Lay, told by a legendary poet, thus:—

At Bacharach, on the banks of the Rhine, a sorceress has fixed her abode. Graceful is she and beautiful. No heart resists her allurements. Many already have perished for her sake. Once caught in her toils, there is no escape. The bishop summons her before the ecclesiastical tribunal. He would have passed sentence upon her, but he could not, so fair was she in his eyes.

"Tell me," cried he, and deeply was he moved as he spoke, "tell me, unhappy Lore Lay, who has made of thee a wicked sorceress?"

"Alas, my lord Bishop, let me die! I am weary of life; for each one that looks upon me is doomed to misery. Magic fire is in mine eye, and in the wave of mine arm is a magic spell. Condemn me to the flames, for only thus canst thou put an end to my enchantments."

"I cannot condemn thee till thou hast told me how it is that thy magic fire has been already infused into my breast. I cannot condemn thee, for my heart would break."

"My lord Bishop, mock not thus a hapless maiden. Be it thine rather to pray for me that the God of all mercy may have mercy upon me. I desire not to live any longer, for I can love no more. Condemn me to death; death is all that I crave of you. He whom I loved has betrayed me—he has abandoned me for a foreign shore. My tender glance, my sweet voice, my face that men call lovely, has been no spell to him. Give me then death; suffer me to die. What should I live for, when him whom I love I can never more behold?"

And the bishop was moved to pity. He summoned three knights. "Take her," he said, "to the peaceful cloister. Go, fair Lore Lay, and may Heaven have pity on thee. Thou wilt become a nun; thou wilt wear the dark robe and the veil, and have fitting space to prepare for thy death-voyage."

The knights depart with her for the cloister, and often as they journeyed did they gaze with pitying sadness upon the fair Lore Lay.

"Courteous knights," she cried, "let me go to the top of yonder rock. I wish for the last time to behold the abode of my beloved;—I wish for the last time to gaze upon the Rhine's deep waters. And then we will go to the cloister and I shall be at peace."

Steep was the rock, precipitous the ascent. But with winged speed she is at the top, and there she stands and cries, "I see a boat upon the Rhine—the who guides the bark must be my beloved. Oh, doubtless it is my beloved, and my heart once more has joy!" With these words, she droops her head, then springs into the whelming waters.

Here ends the poet's song. But the people have caught up the tradition, and add, that Lore Lay still appears in the midst of the river into which she had flung herself. Often is she seen on the surface of the waters, plaiting her long tresses; and nightly is she heard to sing and touch the chords of her harp: and none who approach her too nearly, or lend an ear to her melodious chants, can resist the magic of her voice, the fascination of her glance. They abandon their bark to plunge into the stream.

Thus, in the poetry of the people, beauty is imperishable, and death, which sweeps away at a breath emperor and king and pope, has no power over the soft glance, the sweet voice, of maiden loveliness.

Such is a rapid sketch of German legendary lore. Volumes might be written on the subject, and industriously have the Germans compiled the materials for such a work. The principal collections of these popular stories are to be found in the books of the brothers Grimm, and of Meuser, some of which have been given to the English public through the medium of a translation. It has been well said that the very fables of antiquity should be preserved, because the belief which they obtained, and the influence they exercised, are facts it is not allowable to omit. They are among the most important facts in the history of the human race; they are facts concerning mankind, not merely concerning individuals. Of what importance is it to the present generation whether Cadmus or Theseus existed?—of how much importance that the belief in these men existed for many years! The one is a question of an individual, the other of the state of humanity. Without understanding the errors, prejudices, superstitions, and creeds of various nations, we should not fully be

unable rightly to understand their history, but also our own intellectual constitution. This consideration stamps importance upon—

"Old legends of the monkish page,
Traditions of the saint and sage,
Tales that have the rime of age,
And chronicles of old."

FRANK FAIRLEIGH;

OR, OLD COMPANIONS IN NEW SCENES.

CHAPTER III.

HOW I RISE A DEGREE, AND MR. FRAMPTON GETS ELEVATED IN MORE WAYS THAN ONE.

THE week passed away like a dream, and with a beating heart, and throbbing pulse, I went through the various examinations, and engaged with my competitors in the struggle for honours. Anxious in the highest degree as to the result of my labours, I scarcely ate, drank, or slept, and, had the necessity for exertion been protracted much longer, my mind could not have borne the continued strain, and I should probably have had a brain fever. It was the eventful Friday morning on which the poll list was to come out, and in the course of an hour or two my fate would be known. Utterly worn out by a night which anxiety had rendered sleepless, I had hastily swallowed a cup of tea, and, turning away from the untasted eatables, flung myself, wrapped in a dressing-gown, on the sofa. I had not, however, lain there above a quarter of an hour, when a tap was heard at the door, and Mr. Frampton made his appearance, attired as usual in the well-remembered blue coat, with brass buttons, drab shorts, and gaiters, and the broad-brimmed hat, lined with green, fixed sturdily on his head, as if it was not made to take off at any time.

"Umph! found my way up, you see! Follow you call the gyp wanted to make me believe you were out—thought I looked too like a governor to be let in, I suppose; but it wouldn't do, Sir; old birds are not to be caught with chaff; and he spoke with an air of such intense honesty that I felt sure he was lying, and told him so. Don't get up, boy, don't get up; you look as jaded as a hunted antelope. Why, you've never touched your breakfast; you'll kill yourself if you go on at this rate."

"It will not last much longer, Sir," said I; "in about another hour or so my fate will be known. The poll list comes out this morning. Some of my friends were to call for me, and we were to make a party to go down to the Senate House together, for there is sure to be a crowd; but I shall let them go without me, for I'm in such a state of nervous anxiety that I feel fit for nothing."

"Umph! I'll go with them, if they've no objection," returned Mr. Frampton. "If I should happen to get knocked over in the scuffle, I shall want somebody to pick me up again. I shall like to see how near the tail of the list they stick your name, Frank—umph!"

At this moment the door was flung open, and Lawless, Archer, and one or two more men of my acquaintance, came tumbling over one another into the room, laughing vociferously at some unknown jest. Owing to the shape of the apartment, the place where Mr. Frampton had seated himself was not easily to be seen as you entered, consequently none of them observed him.

"Fairleigh, old boy!" began Archer—

"Eh! here's such a tremendous go!" broke in Lawless. "Where's the smelling-bottle? Archer swears he has just seen the ghost of Noah's great-grandfather, as he appeared when dressed in his Sunday clothes!"

"'Pon my word, it's true, and what will you lay it's a lie?" sang Archer. "Oh! if you had but seen him, Fairleigh; he looked like—hang me if I know anything ugly enough to compare him to."

"Was he at all like me, Sir?—umph!" inquired Mr. Frampton in his gruffest tone, putting on the broad-brimmed hat, and rising slowly from his seat as he spoke.

"The very apparition itself, by Jingo!" exclaimed Archer, starting back in alarm, half real, half affected, thereby nearly overturning Lawless, who was just behind him.

"Hold hard there; where are you jibbing to? You'll smash my panels in a minute, if you don't look out—eh!—why surely it's the old fellow from Helmstone. Mr. Frampton—Sir, your most obedient."

"Same to you, Sir," was the reply; "glad to see your spirits don't seem likely to fail you, Mr. Lawless—laughing at me, all of 'em, impudent young dogs—what's t'other one's name, Frank? the one that took me for a ghost—umph!"

"Allow me to introduce you. Mr. Frampton, Mr. Archer, Mr. Green, Mr. Lacy, Mr. Richards."

The individuals named delivered themselves of a series of nods and jerks as I pronounced their various patronymics, and Mr. Frampton took off his hat, and made a polite bow to each man separately; then turning to Archer, he said,

"Pray, Sir, may I inquire when and how you became so intimate with Noah's great-grandfather as to mistake me for him?—umph!"

"Well, Sir," said Archer, who was evidently taken somewhat aback by this direct appeal, "it is an affair—that is, a circumstance—what I mean to say is—the thing, as you must see, was completely—in fact it was quite by accident, and promiscuously, so to speak, that I mistook you for the respectable antediluvian—I should say, for his ghost."

"Umph! don't think I look much like a ghost, either. Not that there are such things in reality; all humbug, Sir. A man goes and eats beef and pudding enough for two, has the nightmare, fancies next morning he has seen a ghost, and the first fool he tells it to believes him. Well, Mr. Lawless, not made a ghost of yourself by breaking your neck out of that infernal Machine of yours yet. Get King Louis Philippe to go out for a ride with you in that, and his life would be in greater danger than all the Fieschis in France could ever put it in. Umph!"

"The horses are in first-rate condition," returned Lawless, "enough to pull a fellow's arms off till they've done about ten miles; that takes the steel out of them a bit, and then a child may guide them. Happy to take you a drive, Mr. Frampton, any time that suits you,—eh?"

"Thank ye, Sir, when that time comes I'll let you know; but I hope to live a few years longer yet, and therefore you'll excuse my not accepting your kind offer. Besides, if Mr. Archer were to see the ghost of Noah's great-grandfather in a tandem, he'd never get over it." Then came the aside;—"Umph! had him there, the young jackanapes."

"Well, Fairleigh, are you coming with us?" asked Lacy: "the list must be out by this time."

"No; 'pon my word I can't," replied I. "I'm good for nothing this morning."

"Serve you right, too," said Lawless, "for refusing the second bowl of punch last night. I told you no good would come of it, eh?"

"Positively, we ought to be going," said Richards; "we'll bring you some news presently, Fairleigh, that will set you all right again in no time."

"I only wish you may prove a true prophet," replied I.

"Umph; if you'll allow me, I'll accompany you, gentlemen," said Mr. Frampton; "make one of your party, Umph!"

Several of those appealed to exchanged glances of horror, and at last Archer, who was rather an exclusive, and particularly sensitive to ridicule, began—

"Why, really, Sir, you must excuse—"

"Umph! excuse? no excuses are required, Sir; when you've lived as long as I have, you'll learn not to care in what company you sail, so as it's honest company. Noah's great-grandfather found out the truth of that, Sir, when he had to be hail-fellow-well-met with tigers and hippopotamuses in the ark—hippopotami, I suppose you classical men call it—though, now I come to think of it, he never was there at all. But you will let an old man go with you, there's good boys," continued Mr. Frampton, in a tone of entreaty; "not one of you feels more interest in Frank Fairleigh's success than I do."

"Come along, Governor," exclaimed Lawless, taking him by the arm, "you and I will go together, and if any body gets in your way, down he goes if he were as big as Goliath of Gath. You shall see the list as soon as any one of them, for you're a trump,—a regular brick!"

"With a very odd tile on the top of it," whispered Archer, pointing to the broad-brim.

"Now, then," continued Lawless, "fall in there. Follow the Governor; to the right about, face! March!"

So saying, he flung open the door, and, arm-in-arm with Mr. Frampton, hurried down the stairs, followed by the others, in double quick time. When they were all gone, I made an effort to rouse myself from the state of lassitude and depression into which I had fallen, and succeeded so far as to recover sufficient energy to attempt the labour of dressing, though my hands trembled so that I could scarcely accomplish it, and had to postpone the operation of shaving to some more favourable opportunity.

Having made my outer man respectable, I returned to the sitting-room, and waited with impatience for the return of my friends. Oh! the horrors of suspense! that tooth-ache of the mind, in which each moment of anxiety, stretched on the rack of expectation, appears to the overwrought senses, an eternity of gnawing anguish!—of all the mental tortures with which I am acquainted, defend me from suspense!

I had worked myself up into a thorough fever, and was becoming so excited that I was on the point of rushing out to learn the worst at once, when sundry shouts, mingled with peals of laughter, reached my ear,—sounds which assured me that news was at hand. And now, with the inconsistency of human nature, I trembled at, and would willingly have delayed their arrival, lest it might bring me the certainty of failure, than which the doubt and suspense I had been so lately execrating appeared preferable. The sounds grew louder and louder—they were approaching. Oh! how my heart beat! in another moment they would be here. Sinking into a chair, for my knees trembled so that I could scarcely stand, I remained with my eyes fixed upon the door in a state of breathless anxiety. More shouting! surely that was a cheer—

"Hurra! hurra! out of the way there! room for the Governor!"—a rush of many feet up the stairs—more cheering—the door is thrown open, and a party of from fifteen to twenty under-graduates come pouring in, with Mr. Frampton in the midst of them, carried in triumph on the shoulders of Lawless, and another man, and waving a poll-list in one hand, and the broad-brimmed hat in the other.

"Bravo, Fairleigh! all right, old fellow! never say die! hurrah!" exclaimed half a score voices, all at once, while both my hands were seized, and nearly shaken off, and I was almost annihilated by congratulatory slaps on the back from my zealous and excited friends.

"Well," exclaimed I, as soon as I could make myself audible amidst the clamour, "I suppose by your congratulations I'm not plucked, but how high do I stand?"

"Silence there!" shouted Lawless. "Order! order! hear the Governor; he's got the list. Fire away, Sir."

Thus appealed to, Mr. Frampton, who was still mounted on the shoulders of his supporters, having cleared his throat, and grunted proudly, and with an air of majesty, read as follows:

"Rushbrooke, Senior Wrangler,—Crosby, second,—Barham, third,—Fairleigh, fourth!"

"Nonsense," exclaimed I, springing up, "the thing's impossible!"

"What an unbelieving Jew it is," said Archer; "hand him the list, and let him read it himself. Seeing is believing, they say."

Yes, there it was, beyond all possibility of doubt; with my own eyes did I behold it. "Fairleigh, fourth Wrangler!" Why, even in my wildest moments of hope my imagination had never taken so high a flight. Fourth Wrangler! oh! it was too delightful to be real. So overcome was I by this unexpected stroke of good fortune, that for a minute or two I was scarcely conscious of what was going on around me, and returned rambling and incoherent answers to the congratulations which were showered upon me. The first thing that roused my attention was a shout from Lawless, demanding a hearing, for that "the Governor," as he persisted in calling Mr. Frampton, was going to make a speech. The cry was immediately taken up by the others, who for some moments defeated their own purpose by calling vociferously for "silence for the Governor's speech!" Having at length from sheer want of breath obtained the required boon, Mr. Frampton, waving his hand with a dignified gesture, began as follows:—

"Umph! on this happy occasion, gentlemen—set of noisy young scamps!—on this happy occasion, I say"—(shouts of encore! bravo! &c.)—"what I was going to say was—umph!" (a cry of "you have said it," from a man near the door, who thought he could not be seen, but was.) "Much obliged to you, Sir, for your observation," continued Mr. Frampton, fixing his glance unmistakably on the Detected One, "but I have not said it, nor does it seem very likely I ever shall say it, if you continue to interrupt me with your small attempts at wit." (Cries of "hear! hear! don't interrupt the Governor! Shame! shame!" and an aside from Mr. Frampton, "had him, there, umph!" during all of which the detected individual was striving to open the door, which several men, who had perceived his design, held firmly against him.) "What I was going to say," resumed the speaker, "when that gentleman who is trying to leave the room interrupted me," (more cries of "shame!") "was, that I beg in the name of my friend, Frank Fairleigh, to invite you all to a champagne breakfast in his rooms to-morrow," (tremendous cheering, and a cry of "Bravo, Governor! you are a brick!" from Lawless,) "and in my own name to thank you all, except the gentleman near the door, who has not yet, I see, had the grace to leave the room, for the patience with which you've listened to me," (laughter, and cries of "it was a shame to interrupt him," at which the Detected, with a frantic gesture, gave up the door, and turning very pale, glances insanely towards the window,) "and for the very flattering attentions generally, which you have all of you, particularly Mr. Archer, done me the honour of paying me."

A perfect tornado of cheers and laughter followed Mr. Frampton's speech, after which I thanked them all for the kind interest they had expressed in my success, and begged to second Mr. Frampton's invitation for the following day. This matter being satisfactorily arranged, certain of the party laid violent hands on "the Detected One," who was a very shy freshman of the name of Pilkington, and, despite his struggles, made him go down on his knees, and apologize in set phrases to Mr. Frampton for his late unjustifiable conduct; whereupon that gentleman, who enjoyed the joke, and entered into it with as much zest as the veriest pickle among them,

sternly, and with many grunts, rebuked and then pardoned him.

The champagne breakfast on the following morning who shall describe? What pen, albeit accustomed to the highest flights imaginable, may venture to depict the humours of that memorable entertainment? How, when the company were assembled, it was discovered that Mr. Pilkington was missing, and a party, headed by Lawless, proceeded to his rooms, which were on the same stair-case, and brought him down *vi et armis*, in a state of mind bordering on distraction, picturesquely attired in a dressing-gown, slippers, and smoking-cap of a decidedly Oriental character; and how, when they had forced him into a seat of honour at Mr. Frampton's right hand, that gentleman discovered in him a striking likeness to his particular friend the Rajah of Bundelocragbag, which name being instantly adopted by the company, he was invariably addressed by ever after. How, as the champagne circulated, the various members of the party began to come out strong, according to their several idiosyncrasies, every man who had a peculiarity exhibiting it for the benefit of the others; while those who had not, were even more amusing, either from their aping the manners of somebody else, or from the sheer absurdity of uttering insipid common places in such an atmosphere of fun and frolic. How, later in the day, after healths had been drunk, and thanks returned, till every one save Pilkington was hoarse with shouting, that individual was partly coaxed, partly coerced into attempting to sing the only song he knew, which proved to be, "We met;" how, after making four false starts, and causing a great many more meetings to take place than the author of the song ever contemplated, he contrived, in a voice suggestive of a sudden attack of cholera, to get as far as the words, "For thou art the cause of this anguish, my mother," when he was interrupted by such a chorus of laughter as completely annihilated him for the rest of the day. How Mr. Frampton, without giving the slightest warning of his intention, or there being any thing in the subject of the conversation generally to lead thereto, began to relate his adventure with the tiger of Bundelapoor; while Lawless favoured the company with a full, true, and particular account of a run with the royal stag-hounds; and Archer, who had grown sentimental, with tears in his eyes entered into a minute detail of certain passages in a romantic attachment he had conceived for a youthful female branch of the aristocracy, whom he designated as Lady Barbara B.; and how these three gentlemen continued their various recitals all at one and the same time, edifying the company by some such composite style of dialogue as the following: "So, Sir, Slingsby roused me by a kick in the ribs, saying,—umph!—" "Fairest, loveliest of thy sex,"—"Shove on your boots and buckskins, stick a cigar in your mouth, and clap your leg over"—"An elephant half as high again as this room; take a couple of double-barrelled rifles, and"—"Slap at everything that comes in your way; no craning, ram in the persuaders, and if you do get a purr!"—"Look upon it as the purest, brightest gem in your noble father's coronet, for true affection"—"Flung him clean into the tiger's jaws, Sir, and the beast!"—"Drew her handkerchief across her eyes, and said, in a voice which quivered with emotion 'Love between two young creatures, situated as we are, would be utter madness, Charles.' To which I replied, 'Barbara, my own sweet girl,'"—"Mind your eye, and look out for squalls, for that's a rasper, and no mistake."

How all this took place, together with much more notable merriment, not many degrees removed from "tipsy mirth and jollity," we will leave to the fertile imagination of the reader to depict. Suffice it to say, that, ere we broke up, Mr. Frampton had distinctly pledged himself to ride one of Lawless's horses the next hunting-day, and to accompany Archer on a three weeks' visit to the country-seat of Lady Barbara B.'s

noble father, with some ulterior views on his own account in regard to a younger sister.

THE GOODWIN SANDS.

— "a dream
Won from the waters, whose far roarings sleep
Upon oblivion's shores."—*Heraud.*

It was on an Autumn afternoon towards the close of the eleventh century, that a brilliant company was observed by the native cottagers to descend from St. Lawrence Hill, in Thanet, down the little creek leading through the cliffs to the sea, where Ramagat town and harbour now stand.

The day was sunny, and the scene cheerful; and, though the tide was ebbing, the waves, impelled by a light east wind, broke on the sands briskly and cheerily, though by no means roughly. But the sea gulls and curlews hovered around, and kept flying more and more in shore, and the bright blue of the firmament was chequered to windward with those mazy feathery streaks which are vulgarly called "mares' tails." Right in front, so near and distinct that in imagination you might almost wade thither, lay the magnificent and beautiful estate to which our party were bound, called still, from the name of its whilom owner, "Goodwin Island." There it lay almost a span from the land, stretching along the coast, northward as far as the Foreland, and southward further than the eye could here trace it. Gallies and smaller boats were plainly seen plying around its shores, and some were advancing thitherwards, apparently from Sandwich. The outline of the isle was beautifully clear and distinct; the woods in the bosom of which the mansion of the then proprietor was nestled showed their waving outline flickering in the light breeze, and here and there a darker spot on the margin was discerned, which the spectator had no difficulty in ascertaining to be the hut of some domestic villain.

No little excitement was caused on the Thanet shore by the appearance of the party who now advanced down the sands. Ramsgate was then a lonely, desolate, uninhabited spot, only frequented by the peasantry of St. Lawrence, who came thither for the convenience of fishing, and not unfrequently took up their temporary abode for a night (for the convenience of watching their nets) in some of the numerous excavations and caves with which the island abounded. These, habited in rude tunics girt about the waist, and, for the most part, barefooted, quitted their lurking places to gaze with curiosity and wonderment on an apparition of such bravery as seldom greeted their lonely strand, seeing that it was a sudden whim of the royal visitor to cross hitherward from Canterbury, instead of proceeding to the universal embarking place, Sandwich. Such of the natives, also, as were following their craft on the water, speedily forsook their labour, and steered their rude boats as near as they dared to the magnificent galley, which now, with her anchor heaved and laid across the stern, rode gallantly on the water, waiting her royal freight.

The galley was not of very large size, but was sumptuously appointed. At no time were the barges and pleasure vessels of the nobles generally more beautiful than at this; but this one was particularly costly, being the gift of a wealthy noble to the king himself. There was little distinction between the head and stern of the vessel, (both of which rose high from the deck,) except that the former had some slight additional ornament.

Both were richly gilt and burnished, and the deck, rigging, and furniture were all profusely ornamented with gold. The sails were of purple silk, and, coming from the top of the mast, were fastened to the head and stern of the vessel. Within it were many slaves magnificently attired in garments ornamented with gold, and wearing bracelets of pure gold, caps heavy with the same costly material, and each a sword, of which the hilt was solid gold.

As the king set his foot on the gaily-trimmed little boat which bore him to his galley, the musicians stationed on the latter pealed forth a deafening salute on their horns and trumpets. The Red King was attired in a tunic of purple silk, banded round the waist with a gold-embroidered belt, clasped with jewels; bracelets of the same fashion and material fastened it at the wrists, and also confined it round the throat. From his shoulders, probably fastened there by an invisible hook and eye, hung a cloak of crimson velvet lined with furs. His cap was of the same material, with a small coronet of jewels round it, and over the neck a *Rheno*,—perhaps what we might now call a comforter,—covering the neck and breast. It was made of the costliest furs, and worn only by the highest nobility. His chausses were of fine scarlet cloth, and his pointed shoes, an immense length, curved upwards, and twisted like a ram's horn, were richly embroidered. His hair fell down over his shoulders, and his face was closely shaven. His personal appearance was peculiar, and not attractive; the flash of his eye was piercing, and his demeanour had that perfectly natural air of authority and command, which, to be so natural, must be inherent,—as was the case now. But his figure was ungraceful and undignified, his hair red, and his eyes of different colours, or appearing so from the peculiar spots with which they were disfigured. His language was by no means select, and he stammered in his speech.

His companions were attired much in the same style, except that they none of them wore a purple tunic, that colour being consecrated to royalty; and they had mostly cloth caps, turned up in front, without any ornament. One, in ecclesiastical dress, assuming, however, more of the foppery of a secular one than was at all consistent with his sacred profession, was the unworthy favourite, Ralph Flambard, chief justiciary, and recently created Bishop of Durham; to which eminence Rufus had raised him from a low origin, entirely owing to the creature's unscrupulous servility in ministering to his pleasures and vices.

The king and his immediate attendants embarked in the royal galley, which was closely followed by various other vessels, containing either invited guests, privileged attendants, or others, who had followed the progress, prompted by curiosity, or stimulated by the hope of gain.

The noble host, Roger de Fitzmahon, with crowds of serfs of all degrees, *villains*, *cottarii*, and *bordarii*, and above all, near a hundred personal attendants in rich uniform, was at the rude jetty supported on piles, which was the usual landing-place of the island, to receive his royal guest, who, in fulfilment of a long standing promise, came to sup with his faithful follower. This meal was at five o'clock; the other great repast of the day being usually at nine in the morning.

The mansion was large and irregular, and, from the various styles of the architecture (if we may apply such a term to a period when *domestic* architecture was little studied), had recently received various improvements and additions from the time when in Earl Godwin's days it had been a purely Saxon erection. The principal entrance was still in the old building, which was composed of rough planks plastered over, except at the corners, which were faced with stone. It was roofed with lead, a token of the wealth and rank, and especially of the *pride*, of its owner; and the entrance was under a low archway, circular, but without a vestige of

ornament. A wing to the house, of more recent erection, was of stone ornamented round the corners and windows with *brick*, which was, as yet, a comparative rarity, and little used, but for ornament. This wing, though of smaller extent than the original building, was more stately in style and appearance, and bore witness to the improved taste on which the Norman barons were beginning to pique themselves, even in their domestic dwellings. The Saxons had little "house-pride;" the Normans, in time, much; and dwell, we are told, in "stately and magnificent palaces," which began very shortly to assume the aspect of castles.

Scattered all round were sheds, and offices, and hovels, of all shapes, sorts, and sizes,—many of mud only, others of rough wood, the crevices filled or not filled, as it might happen, with coarse mortar of shells and sand. These breasted the main building in a way certainly not becoming, nor in all respects convenient. Little prepossessing as was the exterior of the mansion, the interior was so gloomy that it was frequently requisite to have lights in the day time. The windows were small, square, some few only of them glazed and that badly, and placed so high up in the wall as to serve, like a newly-lighted candle, rather to make darkness visible than to give light. However, the internal arrangements, though presenting the greatest contrast of splendour, and what we, at this day, should call misery, gave evident tokens of preparation for an illustrious guest. The lofty and spacious hall, raftered above, was hung round the upper end with rich tapestry, representing the Temptation of St. Anthony; this did not, however, go round the whole, but the space at the lower end was decorated with smaller pieces. It was hung on hooks at a short space from the walls, and was easily removable, being probably only displayed on festal occasions. It by no means reached the ceiling, between which and the top of the hangings the interstices of the walls (as probably the whole of them might be) were coated with plaster of a shining earth, on which was a rude tracery in coloured figures.

The floor was covered for the most part with rushes, somewhat faded, and not over clean; but at the upper end, where was a dais, or elevated platform, attempts had been made to rifle fresh treasures from the waning year. Boughs of the latest verdure were scattered amid fresh rushes, intermingled with sprigs of wild thyme, samphire, the fragrant wormwood, and the beautiful tamarisk, all which grew in profusion in the neighbouring marshes.

In the centre of the dais was a small table, ornamented in a costly manner with gold, and a seat, so fashioned as to represent a lion's head at each extremity, also wrought with gold. Tables and seats of a less costly description occupied the remainder of the dais; and down the centre of the hall were common oaken ones, and rough wooden benches, some of them with coverings, some not. A proportionate dissimilarity was also apparent in the utensils of the tables. On the one assigned to the king were sparkling Venice glasses, and a costly chased goblet, either of silver gilt, or, it may be, of solid gold; and the adjacent boards displayed no lack of silver cups and bowls, while, as the tables retrograded from the station of honour, horns rimmed with silver, and indeed without the precious garniture, cups of bone, and bowls and platters of wood, were provided; but this was the case in English society for ages later.

Anon the banquet commenced, and the tables groaned under a load of good things; for though, on their first arrival in the island, the Normans had pretended to loathe the gluttony of the Saxons, they by no means preserved their philosophic indifference to the pleasures of the table. Nor was there usually, and especially, we may infer, when a king was to be banqueted, any expense spared in provision.

Of several favourite dishes, such as *harum-pot*, *delle-grout*, *maupiggrnum*, we now know nothing more than

the names; but the boar's head stuck with rosemary (which, in honour of the royal guest, rather anticipated its legitimate season) we are still familiar with. The seasonable geese appeared; but, unlike our modern custom, it was boiled. These, however, though highly esteemed, were not a *peculiarly* dainty offering; but the dish of eels, which (owing, doubtless, to the conditions used to them) cost five pounds—equal to seventy-five of our money—was surely a royal offering. There was also a dish at the royal table composed of the tongue of the whale—a great delicacy; and there were several dishes of porpoise. The flesh of cranes was also daintily dressed with spiceries and sauces; the noble swan and the lordly peacock graced the board; and there were other rare dishes, of which the component parts were brought even from Constantinople, Phœnicia, and Alexandria.

The king did ample justice to the delicacies provided for him, being little interrupted in his gastronomical operations by the dicta of his physician, who, though stationed behind the royal person at all banquets, was too good a courtier to risk his favour with the king by venting sage anathemas on any dishes which he saw were peculiarly pleasing to the royal palate; while the quips of the buffoon (who, as well as the physician, maintained his station behind the king) seemed to stimulate the appetite of the monarch in the exact proportion that his humour was tickled. Indeed, so joyous and jolly was William, that, on one occasion, as a page knelt before him holding a roasted bird on a small spit, for his grace to carve for himself, the jester insisted on his own right to the first severed wing, which the king laughingly accorded him.

During the whole of the banquet, minstrels, stationed in a recess behind the arras, played at intervals on the harp, and on a species of flute. They were, however, but little attended to during the earlier part of the repast; but when the symmel, and wastel, and spice-bread, with the pigment and hypocras, succeeded to the beef and brawn, the ale and cyder,—and more especially when the minute internal crevices left by these substantial viands were being closed by the most exquisitely delicate confections imported from foreign climes, washed down with claret—not the thin-visaged beverage of these degenerate days, but rich, full wine, clarified and mixed with spices,—then, and not till then, did the king bethink himself to make courteous inquiries after the fair daughter of his host. These were duly responded to by her father, who, however, seemed in no wise disposed to dwell on the theme.

"Surely the fair Ermentha will permit us to pay our debts to her: methinks the feast lacks its proudest ornament, wanting her presence."

"I pray your grace to pardon her: my daughter is evil-disposed, and keepeth her chamber by the leech's command."

"Nay then, truly, she the more requireth the solace of our presence. Our own leech shall administer to her malady, and we will assist his judgment with our royal opinion."

"At your royal pleasure; but I shall fear that my humble entertainment is altogether unworthy and distasteful, if ye suddenly quit it. I have some wine of a choice vintage, which I have studiously reserved for this period, trusting to have your grace's favourable judgment thereon."

"Produce it, man, produce it; nor fear that we will prescribe the less judiciously for the Lady Ermentha's malady; for, by the face of St. Luke, good wine is a marvellous sharpener of the wit."

Under the pretence of earnestness to meet the king's wishes, Roger de Fitzmahon mingled amongst the attendants; and, drawing one aside, whispered to him, "Haste thee to the lady: bid her that she instantly speed to her bower in the vale, and that she stir not thence until I myself summon her. Haste thee: abide with her thyself, and, for thy life, be silent."

This precaution taken, the alarmed father returned to his guests, and now, from a stronger motive than hospitality, plied the king's goblet unremittingly with the choicest and best of his vintage. The brutal licentiousness of the times, when the noblest maidens of the land had no hope of security but within the walls of a convent, more than justified the anxious parent's precautions, whose object was to render the king insensible. Meantime the mirth and merriment increased, but was near having a sudden check put to it by an injudicious reference to the Archbishop Anselm, who, though he had been long abroad, still continued to assert claims which incensed the vindictive and irreligious king.

"May I become an Englishman!" said he, stuttering even more than usual from choler and wine—"may I become an Englishman, if I yield one jot or tittle to that stiffnecked prelate. By the crucifix at Lucca," continued he, starting up—

But he was interrupted by the abrupt entrance of two or three nobles, who had shortly before quitted the hall, and who now returned in haste to say that the tide was flowing roughly, that a heavy storm was apparently approaching, and that it would be advisable to hasten their departure.

"By the face of St. Luke," said the king, "I stir not: what is the storm to me?"

"Nay, your grace: the passage, though so short, may not be the less dangerous, if delayed."

"Danger! tush! When heard ye ever of a king being drowned? I stir not these three hours;" and again he replenished his goblet.

During this interval other guests had been out, and with them the Bishop of Durham. He, like the rest, felt the desirableness of passing to the continent immediately, unless, indeed—which could not be thought of—their departure were deferred till the morning. To argue with the king in his present mood he knew to be utterly useless: he used a subtler weapon, and appealed to his cupidity. He approached the king, and spoke in a low voice:—

"In truth it liked me not to mar so goodly an entertainment with ill-timed intrusion, else would I have beseeched your grace to depart some time ago, for I have despatches from the Earl of Poitiers, brought to me but now, wherein he announceth his intention of joining the Croisade, and offereth to mortgage his dominions to your grace. He craveth, however, a speedy answer, seeing that he hath hope of obtaining the money from another quarter, but giveth your grace the preference."

"By the face of St. Luke, man, we will take him at his word: but how to raise the money?"

"Fear not that—I have already devised the means; but I must consult with your grace thereon. Is it your pleasure that we depart?"

"Instantly. May I be an Englishman, if the world be not gone mad after this Croisade."

It may readily be supposed that the wily bishop's intimation of another bidder for the Earl of Poitiers' domain was a pure invention: nevertheless, it answered the purpose; and, as quickly as possible, the royal visitor and his immediate attendants quitted the island.

About a mile from the mansion southward was a little creek which ran in a zigzag direction half across the island, and near the source of this creek was a tiny nook which nature might have meant for the choice retreat of the queen of the fairies, so lavish had she been in her donations to the favoured spot. Even now, though November had commenced his dreary reign, the grass was of the most beautiful green, and many a flower opened its crimson, azure, or golden petals to the light, unconscious of the near approach of winter. A small bower was erected here, of rude appearance with-

(1) His own most kingly remark on another and more worthy occasion.

out; but within it was closely hung with fine tapestry, the seats were all covered with embroidered work, a day-couch was laid with the finest skins, and on the floor beneath it, a soft warm skin was laid over the rushes. On the table were a lute and an embroidery frame. The bower had evidently been decked with fond care and at much expense for the solace of the fair possessor.

And she was fair—she who now occupied the apartment—young and beautifully fair, with soft blue eyes, and flaxen hair parted on her ivory forehead, and hanging in rich waves over her shoulders. She regarded her companions—a damsel and a male attendant (who seemed above the rank of “villain,” and yet far from “gentle,” being perhaps a *bordarius* or upper domestic servant)—she regarded them with a look of mingled perplexity and anxiety.

—and desired that I should remain here until he came. Were these indeed, Hugo, my lord and father's commands?”

“In truth, lady, even as I have told you.”

“And assigned he no reason?”

“None, Lady.”

“And canst thou guess none?”

“In good truth I cannot.”

“’Tis passing strange that he should send me hither on a night wet, stormy, and in truth very cold,” said the young lady, shuddering as she drew her furred mantle closely round her slender form, which was enveloped in a long flowing silken tunic, girt round the waist with a band of embroidery, whilst a veil, fastened on her head with a small gold circlet, hung round her shoulders.

“He is ever cautioning me against abiding much here even in seasonable weather, and when every precaution hath been taken for my comfort; and lo! now, when, owing to the bustle of the banquet, no spark of fire hath been kindled here for a week, he sendeth me hither on, in truth, the most wintry evening the season hath yet known.”

“Rest assured, even therefore, dear lady, that mine honoured lord hath good and sufficient reason for what he doeth, and that his orders proceed not from any lack of anxiety for your comfort.”

“Thou art right Maude, and I was much to blame to cavil at his command: but hark! by our lady he is here; that is his note.”

A whistle on a silver call had instantly been recognised by the lady as her father's, who indeed now entered the bower. She hastened to meet him, and he greeted her with the fondest affection.

“My precious lady-bird, I am about to put thy courage to the proof. Thou must cross with me to Sandwich to-night.”

“To-night! nay, good my lord, not so. It is a fearful night.”

“It is so: but the wind though stormy is good for the land: the tide also is favourable: and in truth, my child, were it not so, I have no alternative. The king who has just embarked, hath unexpectedly commanded my immediate attendance; and not for the treasures of his realm would I trust my precious flower under the same roof with yon rude wassailers, unchecked by my presence.”

The Lady Ermentha involuntarily clung closer to her father, and offered no further opposition to his will. Some question she put touching the stay of the revellers.

“Nay, they mean not to stay; they are even now departing; but doubtless there will be many loiterers; besides that I know not what license this unwonted revelry may introduce among my own serfs, I not being here to control them. But hasten: I have ordered thy place in the vessel as regardfully as such short time for preparation would admit, and I will bestow thee for the night at Sandwich, with the worshipful the Bailiff, whose dame will be glad to welcome thee.”

The prognostications of the revellers with regard to the approaching storm were fearfully borne out by the result. The strong east wind became a tempestuous blast; the blast strengthened and deepened till it became a furious hurricane, roaring, shrieking, howling, and bellowing without intermission for days and nights. High above the cliffs, high above the forland, the boiling billows foamed and tumbled,¹ breaking on the shore with a terrific noise like thunder, and dashing far inland, trees torn up by the roots, piles of timber, pieces of furniture, wrecks of vessels, and human bodies. In vain did the awe-struck inhabitants of the mainland, and of Thanet Island, turn their eyes eastward. All that could be seen were the foaming billows dashing against the leaden sky, whilst for the most part even these were shut out from sight by the torrents of rain which rendered all beyond a few yards' space utterly undiscernible.

For days the tempest continued unabated, and fearful news began to be whispered about of towns and villages swallowed up by the waves, of hundreds of human beings lost in the inundation, of the whole course of the Thames being marked by deluge and devastation, and of evil spirits openly exulting over the wreck.²

But it subsided: day after day the wind abated; day after day the waters retired, and at length seemed to have returned to their usual bounds. And now anxiously, most anxiously, did the bachelors of Kent look to a visit to Godwin's Island, where they doubted not to find much damage, much scathe, and it was to be feared loss of life. But day after day they looked for the island and it did not appear; and doubtless they thought the thickness of the atmosphere, not yet cleared from the storm, hid the land. But one morning the sun rose bright and beautiful, the air was clear, not a cloud was to be seen in the whole horizon, and the sky was brilliantly blue.

Now they looked for the island—and saw (for it was low water) a thin narrow strip or line of sea-sand shimmering in the sun.

Now—a holiday stranger at Ramsgate, wandering perchance on the shore, sees a small sparkle on the waters, shimmer through the advancing gloom of night.

“What is that?”

“Oh, only a light on the Goodwin sands.”

And probably we esteem it “only a light,” and think no more about it: or it may be that a solitary walk induces a meditative mood; imagination draws the curtain of ages aside, and the actions and images of the days of yore rush on our fancy. We see feasting and revelry; a princely mansion; a noble host; a royal guest; crowds of retainers:—we hear the tinkle of the harp, the songs of the minstrels, the quips of the jestours, the uproarious mirth of the revellers—and a hallowed contrast to these, the gentle music of that fair girl in her lone retreat. But somehow, without breaking the spell, the dash of the waves at our feet mingles with, and colours the vision; and we see the calm sea that bordered the island become agitated, heave, swell, and finally roll tempestuously. The waves advance—they reach the mansion—they fill its chambers—they foam and tumble higher than its roof:—the shrill screams of the dying are lost in the reverberating thunder

¹ This is not an exaggeration. There is an account given in the Annual Register for 1816, of a storm on this very spot, in which it is said, that the surf rose considerably above a hundred feet from the sea, and broke with such force over the cliffs as to inundate every object around.

² “In his 12th year an excessive tide flowed up the Thames, and overwhelmed many villages with their inhabitants.”—*William of Malmesbury*.

“After yt Kyngye Wyllyam, as before is sayd, was returned out of Normandy, many wonderfull prodgyes and tokens were shewed in Englonde; as ye swelling or fynyng of the water of Thames, in such wyse yt it drowned diverse townes and dyd much harme by cuttynge his boundys in diverse places about London and elyewhere. Also the devyll was seene walke in many places.”—*Fabyan*.

of the waters:—we see them heaving to and fro over a hundred drowning despairing souls, while a light—a solitary light—by some spell hangs over the spot, as if it were a warning token from those gone down into the deep.

A grasp on our arm—we spring aside as if from a serpent.

"What, in the name of wonder, are you about, my dear? I've been seeking you everywhere, and supper's been waiting this half-hour."

RAMBLES IN BELGIUM.

NO. VII.—LIEGE AND VERVIER.

THE entrance to Liege, owing to the moonlight falling on the waters of the Meuse, was much more picturesque at night than I found it to be by day. The town is very different from either Ghent or Bruges. There are none of the old halls, and architectural accessories, which render those towns such objects of attraction. Coal, too, is found in abundance in the neighbourhood, and produces a corresponding increase of smoke and dirt. There are several manufacturing for fire-arms. I visited a workshop, where I found a brawny fellow, worthy to follow his profession, as he termed it, of armourer. He offered me a double-barrelled gun, apparently proved, and well made, for twenty-nine francs. It was made on the old principle of flint locks; he informed me that neither he nor his *confrères* had as yet adopted the percussion caps; and added, that he did not consider them any improvement on the older fashion. Large quantities of fire-arms are annually exported to all parts of the world, and have even found their way to the great marts of England. This may be readily believed, inasmuch as the cost of their production is so much less than our own. There is a foundry of cannon in the town, which continues its operations in a very flourishing manner. Near the Black Eagle is a fountain of very fair design, and presenting a good contrast in its soothing, lulling sound, to the noise and bustle which pervade the streets. The shops are well supplied, but I found them not at all more reasonable than in London, and in articles of drapery most decidedly inferior. One linen draper's store had a very familiar, yet odd aspect; for wherever the eye could penetrate, there were to be seen displayed Manchester prints, and a great number of plaids of every hue and pattern; these were accompanied with special notices in good old English characters of their excellent quality, and warranted British manufacture. It did not require much time or attention to discover that there is very little in this city to excite the interest of tourists, whether antiquarians, artists, or gentlemanly idlers. The Palais de Justice was the first point to which I hastened. It is chiefly remarkable for an inner court full of arcades, which are supported by low pillars, each of which is embellished in a different manner to its fellow. Returning at night to visit it again, there was a strange and fine effect produced by the moon-beams lingering on the columns, which threw the more distant parts of the building into so sudden a shade that it appeared to be the very spot for some stirring incident, such as may be found in the pages of some mysterious romance. Then came, naturally enough, thoughts of "Quentin Durward," and the "Great Wizard of the North." I was sorry not to be able to lay my hand on his fascinating tale, and so to trace upon the spot the scenes so admirably told. What a high prerogative has genius! What a power to elevate the common-place and material above its true and real position! How many persons are there in this working world, whose only acquaintance or

knowledge of this Liege, this town of activity and commerce, is through the medium of the poet-novelist, the great known "Unknown!"

There are several churches in Liege, but from what I had heard of their relative merits, I visited one only, St. Jacques. The interior did not please me at all: profuse in very florid Gothic architecture, with rich embellishments, traceries, arabesques, and gildings, there was a total want of repose, of that chaste simplicity which, to my thinking, best becomes the house of prayer. All through Flanders, this same feeling forced itself on my notice wherever I went; meretricious and elaborate ornaments continually supplying the place of solemn avenues of arches, simply but appropriately adorned. In our own cathedrals what effect can be more beautiful, or more impressive, than their interiors convey? There is a singleness or quietude of art, which is, after all, the true grandeur; as at sea, what is more striking, or more magnificent, than the ceaseless roll of the ever-moving waves; when not a ship, or animate or inanimate thing, disturbs the view of the wide expanse of waters. So, too, at night, when there is no moon, and the air is very clear and cold, how brilliant are the stars, how lustrously they burn in their spheroid orbs, undimmed by the superior brilliancy of the poetic moon!

One thing, I must confess, manifested itself in unmistakable reality in all the churches and chapels during the hours of divine service throughout my wanderings in this country,—the apparent devotion, and wrapt earnestness of the entire congregation. Nothing could or would distract their attention from the serious offices of their religion. If strangers came in to examine the paintings, or admire the buildings, it was all one to them, they moved not, nor exhibited any sign of disturbance. Heartily engaged in solemn prayer, they heeded no intrusions, however unwelcome or regardless. My fancy upon one particular occasion, in this very place, and in the church before mentioned, led me, albeit to the detriment of my own countrymen, to compare the effect of some new comers or strangers entering a place of worship in a metropolitan suburb, or rural district in old England.

There are some charming views to be obtained in the vicinity of Liege. The Meuse is the grand contributing feature. The junction of the Ourthe with this river, so sweetly sonneted by Wordsworth, takes place close to the town. The Vesdre, which is a small shallow unnavigable river, soon joins them, and the three conspire to render the situation of the valley altogether beautiful. Quitting Liege for Verviers, the road winds up a toilsome ascent, which being filled by a troop of soldiery, mounted and in good order, had a picturesque appearance, exceedingly showy and good, as the early morning sun glittered on the habiliments of the men. The middle of the highway was paved, and the driver of the carriage, a most steady-looking and grave-faced man, invariably kept his horses upon it, and whenever, which was a very unfrequent occurrence, another vehicle approached him, deliberately made his team stand still. By the way-side were many crosses, and wretchedly executed figures of the Virgin Mary, and numberless saints.

It was impossible to stop the horses at anything which attracted one's notice, for the beggars were "legion," some of them most miserable objects, chiefly of the softer sex, imploring, begging, praying, screaming, shouting, entreating, crying, and occasionally, it would seem, imprecating, and all this *pour l'amour de Dieu*. At a little inn, the host brought out some flat cakes of oaten bread; in my blissful feeling of ignorance, I fancied it was intended for Monsieur le Voyageur; not so, for the imperturbable coachman slowly descended from his seat, and after quietly unfastening the bridles and reins, handed the delicacies to the animals, who, truth to say, appeared much in want of, and relished them accordingly. When they had nearly consumed

this extraordinary provender, mine host remembered that possibly Monsieur would please to alight and take what his poor house could afford. It was my wish to proceed, but the lord of the box informed me that his horses were not common animals, and being of some extraordinarily gifted nature, would certainly stop another half hour. There was no help for it, so out I got, and ensconced myself in an odd looking but cheerful room, apparently as old as the middle ages. Here I was regaled with some Belgian buns, and a tumbler of milk, which had been boiled and sweetened to excess. When the horses were quite ready to continue the journey, I was summoned to enter the vehicle, which was driven at a rate which made me believe that both the driver and horses had had a "wee drappie." It was not long before Verviers was reached. It is a straggling manufacturing town on the banks of the Vesdre. All descriptions of worsted and cloth are made here.

The inhabitants did not give any idea of an unwholesome occupation, nor did the place look at all like the manufacturing districts of the north of England. The surrounding scenery, and the wide handsome streets, and clean-looking habitations, had a cheerful healthy look, which differed from many other towns of a like stamp, even in Belgium. In a conversation held with a very intelligent gentleman, who was much interested in the prosperity and respectability of his country, I heard much of the revolution which seated King Leopold on the throne. Sad havoc was the consequence of the revolutionary sentiments finding their way here. All sorts of depredations were committed, many valuable pieces of machinery were utterly destroyed, and it took the more respectable citizens a long time to restrain the passions of the angry multitude, and to bring their turbulent and rebellious blood into a calmer channel. It is here where the woollen trade is carried on to the most considerable amount. The workmen in very many instances employ themselves in their own dwellings, as in the case of the fire-arms manufacturing at Liège.

From the little I could glean after and during an inspection of several large factories, I came to the conclusion that capital is wanted to increase and carry on the trade, which without it must inevitably decline. Within a few miles is Eupen, the frontier of the Prussian dominions. With the exception of a ruinous town, dreary, desolate, and melancholy, and which harmonizes exactly with the character of the surrounding hills and dales, there is no remarkable object of which mention need be made. I was bound for Malines, but instead of retracing my steps, I preferred taking to the railroad, which bore me with its rapid wings to my destination in a few hours.

FORTUNE'S WANDERINGS IN CHINA.¹

THIS is without exception the most interesting book of travel of the season; it is a book thoroughly devoid of all pretension or attempt at book-making. Previous to the war, our knowledge of China and the Chinese was limited enough, and what was known was in too many instances grossly exaggerated, and mixed up with very pleasant fictions. A determination on the part of the natives of all classes and in all parts of the empire of the "Flowery Land," to envelope their actions in mystery, served for a length of time to render their country a complete *terra ignota*, and also to promote the extension and diffusion of all kinds of absurd stories, which a little mystery always prompts the lovers of the marvellous to originate.

It is very seldom that war, that most devastating of

all evils, is productive of good results; but it is most earnestly to be hoped that now that the war is at an end, civilisation and Christianity may work their way hand in hand in the Celestial Empire. At all events, one good has ensued:—Mr. Fortune has given us by far the most authentic, valuable, and truthful epitome that has ever appeared of an Englishman's intercourse with these strange people. He was despatched, soon after the news of the peace first reached England, as botanical collector to the Horticultural Society of London, and in pursuit of the Society's objects travelled through a vast extent of territory. That those persons to whom botany is a *drug* may not be deterred from following in the wake of Mr. Fortune, we can assure them of a plentiful stock of amusing matter, worthy their attention, as highly illustrative of Chinese manners and customs. Take for example his account of a visit to one of the greatest lions of Chusan, an artificial hatcher of ducks' eggs.

"Walking through the city, and out at the north gate, I passed through some rice-fields, the first crop of which had been just planted, and a five minutes' walk brought me to the poor man's cottage. He received me with Chinese politeness; asked me to sit down, and offered me tea and his pipe,—two things always at hand in a Chinese house, and perfectly indispensable. Having civilly declined his offer, I asked permission to examine his hatching-house, to which he immediately led the way. The Chinese cottages are generally wretched buildings of mud and stone, with damp earthen floors, scarcely fit for cattle to sleep in, and remind one of what Scottish cottages were a few years ago, but which now, happily, are among the things that were. My new friend's cottage was no exception to the general rule: bad-fitting, loose, creaking doors, paper windows, dirty and torn, ducks, geese, fowls, dogs, and pigs, in the house and at the doors, and apparently having equal rights with their masters.

"Then there were children, grandchildren, and for aught that I know, great-grandchildren, altogether forming a most motley group, which, with their shaved heads and long tails, and strange costume, would have formed a capital subject for the pencil of Crankshaw. The hatching-house was built at the side of the cottage, and was a kind of long shed, with mud walls, and thickly thatched with straw. Along the ends and down one side of the building are a number of round straw baskets, well plastered with mud, to prevent them from taking fire. In the bottom of each basket there is a tile placed, or rather the tile forms the bottom of the basket; upon this the fire acts,—a small fire-place being below each basket. Upon the top of the basket there is a straw cover, which fits closely, and which is kept shut whilst the process is going on. In the centre of the shed are a number of large shelves, placed one above another, upon which the eggs are laid at a certain stage of the process. When the eggs are brought they are put into the baskets, the fire is lighted below them, and a uniform heat kept up, ranging, as nearly as I could ascertain by some observations which I made with a thermometer, from 95° to 102°; but the Chinamen regulate the heat by their own feelings, and therefore it will, of course, vary considerably. In four or five days after the eggs have been subject to this temperature, they are taken carefully out one by one, to a door in which a number of holes have been bored, nearly the size of the eggs; they are then held against these holes, and the Chinamen look through them, and are able to tell whether they are good or not. If good, they are taken back and replaced in their former quarters; if bad, they are of course excluded. In nine or ten days after this, that is, about fourteen days from the commencement, the eggs are taken from the baskets, and spread out on the shelves. Here no fire heat is applied, but they are covered over with cotton, and a kind of

¹ Three Years' Wanderings in the Northern Provinces of China. By Robert Fortune, Botanical Collector to the Horticultural Society. London, Murray, 1847.

blanket, under which they remain about fourteen days more, when the young ducks burst their shells, and the shed teems with life. These shelves are large, and capable of holding many thousands of eggs; and when the hatching takes place, the sight is not a little curious. The natives who rear the young ducks in the surrounding country know exactly the day when they will be ready for removal, and in two days after the shell is burst, the whole of the little creatures are sold, and conveyed to their new quarters."

The curiosity displayed by the inhabitants of the villages and localities where our traveller wandered appears to have been intense. Hundreds of men, women, and children flocked eagerly to see the *barbarian*. There is a most graphic account of one of the principal methods employed by this singular people of catching fish, by means of the cormorant. The extract would be too long for our purpose, besides the whole chapter should be read to appreciate the vividness of the description. The dwarfing of trees is a curious process:—

"Stunted varieties were generally chosen, particularly if they had the side branches opposite or regular, for much depends upon this; a one-sided dwarf tree is of no value in the eyes of the Chinese. The main stem was then in most cases twisted in a zig-zag form, which process checked the flow of the sap, and at the same time encouraged the production of side branches at those parts of the stem where they were most desired. When these suckers had formed roots in the open ground, or kind of nursery where they were planted, they were looked over, and the best taken up for potting. Whilst the branches were forming, they were tied down and twisted in various ways; the points of the leaders and strong growing ones were generally nipped out, and every means were taken to discourage the production of young shoots which were possessed of any degree of vigour. Nature generally struggles against this treatment for a while, until her powers seem in a great measure exhausted, when she quietly yields to the power of art."

Mr. Fortune had an invitation to go to the house of a mandarin, to see a theatrical performance, or "Sing-Song," and to dine afterwards *à la Chinoise*.

"Tea was immediately handed round. Shortly afterwards a servant came with a tray full of wet warm towels, not unlike those generally used in kitchens at home, and presented one to each of us. At first we could not conjecture what these were for; but on looking at our Chinese friends, we observed them rubbing their faces and hands with them, and, although not very agreeable to us, we immediately did the same. I afterwards found that this was a common custom amongst the Chinese, and I have often been much refreshed by it after a warm walk. In hot countries like China, this plan is much better, and more conducive to health, than either washing, or bathing in cold water. While this was going on in the house, the players were getting everything ready in the large room where the performance was to take place. In a little while one of them entered the room where we were, carrying in his hand several fine long ivory cards, on which were written a number of the most popular plays of the day, any one of which the players were ready to perform at the command of our host and his friends."

The actors, it seems, were all men, and wore most superb costumes. There was no scenery, other than a screen. The feats of tumbling, fencing, and pantomime, were very curious and entertaining. The acting was accompanied with a sort of singing, and plenty of noise, made by gongs, and wind instruments like bagpipes. The play having occupied three mortal hours, the dinner began, and a seemingly interminable affair it was.

Fruits and vegetables in abundance, bird's nest soup, and all sorts of excellent cakes succeeded one another in great rapidity. Occasionally the Chinese smoked, then ate *à discretion*. Enough is as good as a feast, however, and in this instance especially.

"We had now been three or four hours at table, and although the whole affair had been very amusing, we had had enough of it, and were beginning to tire. 'How long shall the dinner last?' said I to a linguist who was placed next to me, and who had most politely explained every thing which had occurred during the entertainment. 'Oh,' said he, 'it will last for three or four hours longer, but if you want to go away you may do so now.' We were very glad to find that Chinese etiquette permitted us to withdraw, and ordered our chairs, which were waiting in the court-yard to receive us.

"Our host and his friends lighted us out with lanterns, and we took our departure in the same style in which we came. So ended my first Chinese dinner."

The difficulty of managing the chop-sticks, upon this and other occasions, afforded much entertainment to the natives, and gave some trouble to the English traveller. There is a chapter devoted to the tea-plant, its culture, mode of growth, method of gathering, drying, &c., from the perusal of which it is impossible to rise without having very considerably increased in knowledge of the subject. It is written without pedantry or affectation, and so clearly that he who runs may read and learn.

The following is the mode of smoking opium pursued by the Chinese:—

"Opium is prepared for smoking, and is kept in small cups, which are made for the purpose. The smoker lays his head upon a pillow, has a lamp by his side, and, with a kind of needle, he lifts a small portion of the opium to the candle; and having ignited it, he puts it into the small aperture of the bowl of the pipe. The candle is applied to the bowl during the process of inhaling, and the smoke is drawn into the lungs in the same manner as an Indian or Chinese swallows tobacco. A whiff or two is all that can be drawn from a single pipe, and therefore those who are accustomed to the use of the drug have frequently to renew the dose."

The denizen of Cockaigne will doubtless be surprised to find that Baths and Washing-Houses are to be regarded as regular public institutions in China.

"In the town of Shanghai, as well as in many other large Chinese towns, there are a number of hot-water bathing establishments, which must be of great importance as regards the health and comfort of the natives. I will describe one which I passed daily during my residence in Shanghai. There are two outer rooms, used for undressing and dressing; the first, and largest, is for the poorer classes; the second, for those who consider themselves more respectable, and who wish to be more private. As you enter the largest of these rooms, a placard, which is hung near the door, informs you what the charges are, and a man stands there to receive the money on entrance. Arranged in rows down the middle and round the sides of both rooms, are a number of small boxes, or lockers, furnished with lock and key, into which the visitors put their clothes, and where they can make sure of finding them when they return from the bathing room, which is entered by a small door at the farther end of the building, and is about 30 feet long and 20 feet wide; the water occupying the whole space, except a narrow path round the sides. The water is from 1 foot to 18 inches deep, and the sides of the bath are lined with marble slabs, from which the bathers step into the water, and on which they sit and wash themselves: the furnace is placed on the outside, and the flues are carried below the centre

of the bath. Those visitors who use the common room, pay only six copper cash; the others pay eighteen, but they have in addition a cup of tea and a pipe of tobacco from the proprietors. I may mention, that one hundred copper cash amount to about 4d. of our money; so that the first class enjoy a hot-water bath for about one farthing! and the other a bath, a private room, a cup of tea, and a pipe of tobacco for something less than one penny!"

Agriculture is carried on in the most extensive manner, but it would seem that, as their forefathers did, so do they now. Progress or improvement in this respect seems out of the question. The Emperor, himself, after three days' prayer, engages in farming processes, in order to prove his high estimate of the importance of cultivating the earth.

The manner of burying their dead is curious; tombs, graves, coffins are met with in all sorts of places.

"In the south, the natives form no regular cemeteries or churchyards as we do in Europe; but the tombs of the dead are scattered all over the sides of the hills, the most pleasant situations being generally selected. The more wealthy individuals often convey their dead a considerable distance, and employ a kind of fortune-teller, whose duty it is to find out the most appropriate resting place. This man goes with the corpse to the place appointed, and, of course, pretends to be very wise in the selection of the spot, as well as in the choice of the soil with which the ashes of the dead are to mingle in after years; and upon trial, should the particular earth appear unsuitable, he immediately orders the procession off to some other place in the neighbourhood, where he expects to be more successful. I believe many of the Chinese have this important point settled before they die; for one day, when one of our principal merchants went to call on old Howqua, the late Hong merchant at Canton, a tray was brought into the room with several kinds of earth upon it, which the old man examined with great care, and then fixed on the one in which he wished to be buried. A situation on the hill side is also considered of great importance, especially if it commands a view of a beautiful bay or lake. But, I believe, that of all places, the one most coveted is, where a winding stream, in its course, passes and then returns again to the foot of the hill where the grave is to be made. The director of the ceremonies, with a compass in his hand, settles the direction in which the body is to lie, which is another point of great importance.

"An intelligent Chinese, with whom I was acquainted, informed me that this fortune-teller of the dead is often very eloquent in his descriptions of the future happiness of those who obey his directions; he informs them that they or their children, or some one in whom they are much interested, shall enjoy riches and honours in after life, as a reward for the attention and respect they have paid to the remains of their fathers;—that as the stream which they then behold, when standing around their father's grave, flows and returns again in its windings, so shall their path through life be smooth and pleasant until they sink into the tomb, hoary with years, respected, beloved, and mourned by their children. These men are generally great rogues, and play upon the prejudices of the people.

"It frequently happens, that after a corpse has been interred for some time, they call upon the relatives and inform them, that for some cause, which they affect to explain, it is absolutely necessary to remove, and reinter it. Should the relations object to this, the answer is, 'Very well; I don't care; but your children and relations will also be regardless of your remains when you die, and you will be miserable in your graves.' The feelings of the poor deluded people are thus wrought upon, and a further sum of money is extracted for finding a more suitable grave."

The question of the black and green teas being taken from the same plant is here decided.

"I have stated in a former chapter, that the tea-plant of the northern green tea districts, is the true *Thea viridis* of botanists. I was now fortunate enough, not only to find an extensive tea district, but also to be present when the natives were picking and preparing the leaves; and I not only procured specimens for my herbarium, but also a living plant, which I afterwards took to the green tea hills of the north, and found, on minute comparison, that it was identical with the *Thea viridis*. In other words, the black and green teas which generally come to England from the northern provinces of China, are made from the same species, and the difference of colour, flavour, &c., is solely the result of the different modes of preparation."

There is, as usual, superstition among all sailors, the Chinese not excepted. Something of a devotional spirit is, however, mingled with their preparations for a voyage.

"The Chinese sailor never goes to sea without first presenting an offering to the gods to propitiate them, in order that the voyage may be a speedy and successful one. Accordingly, on this day, the cabin of our junk was set in order, and the tables covered with dishes of pork, mutton, fruits, and vegetables. Candles and incense were burned upon the tables for a short time, and the whole business had something solemn and imposing about it. The cook, who seemed to be the high priest, conducted all the ceremonies. On other days, as well as this, it was part of his duty to light the candles in the little temple, where the gods were kept, as well as to burn incense, and prostrate himself before them."

There is a most exciting and interesting scene on board this same junk, when the pirates make their appearance. For all account of this, however, the reader must consult Mr. Fortune's delightful volume. On our parts, we can assure him a great treat, and may fairly state in conclusion, that this work is the most precious contribution towards our knowledge of an extraordinary race of people.

TRAVELS IN THE STEPPES OF THE CASPIAN SEA.¹

The volume before us forms one of that really valuable series of good and cheap works "The Foreign Library," and affords, like almost all its predecessors, much valuable and important information, which would otherwise be unknown to a large portion of the public. It is inferior to none of the early volumes, and gives a very much more perfect History of Southern Russia than any work on the same subject with which we are acquainted. Our limits will not allow us on the present occasion to do more than give a very brief extract; and although we have suffered a severe winter, we have not been visited with any thing like the Snow Hurricane of Odessa.

"No language can give an idea of these *metels*, or hurricanes. They come down on the land with such whirling and driving gusts, such furious and continuous tempests, such whistlings and groanings of the wind, and a sky so murky and threatening, that no hurricane at sea can be more alarming. The snow is now piled up like a mountain, now hollowed into deep valleys, and now spread out into rushing and heaving billows;

¹ "Travels in the Steppes of the Caspian Sea." By Xavier Hommaire De Hell. Chapman and Hall.

or else it is driven through the air like a long white veil, expanding and folding on itself until the wind has scattered its last shreds before it. In order to pass from one house to another, people are obliged to dig paths through the snow, often two yards deep. Whole flocks of sheep, surprised by the tempest not far from their fields, and even herds of horses, have been driven into the sea and drowned. When beset by such dangers their instinct usually prompts them to cluster together in a circle, and form a compact mass, so as to present less surface to the *metel*. But the force of the wind gradually compelling them forwards, they approach the shore, the ground fails them, and finally they all disappear beneath the waves."

Poetry.

[In Original Poetry, the Name, real, or assumed, of the Author, is printed in Small Capitals, under the title; in Selections it is printed in Italics at the end.]

TIME AND THE MAIDEN.

BY A. H. I.

"Oh, gentle Time! give back to me
One hour which thou has taken;
I ask it as a boon of thee,
That one hour to awaken.

"It is too beautiful to be
Within thy darkness lying:
Oh I bring it back unchanged to me;—
It was too fair for dying."

And gentle Time, he heard her pray,—
He touched the hour she cherished,—
And called it back to life—the day,
The hour, which long had perished.

He brought her back the same sweet sky,
The flowers around her blowing,
Shedding their odorous fragrant
As though they still were growing.

And all was bathed in evening light,
In softest sun-light shining;
The dying day—the waking night,
Their beauties were entwining.

Perfect the silent loveliness,
Over her senses stealing—
Her voice, when she essayed to speak,
Trembled with inward feeling.

It trembled as she strove to speak,
"All blessings on the spirit,
But where is he for whom I seek,
Whose love I do inherit?"

"The brightest hour from out the sky,
By human eye beholden,
Without him would pass dimly by;
He made the light more golden.

"Far better, gentle Time, to be
Lying the green earth under,
Than live the shining heavens to see,
From those we love asunder!"

But Time, he answered mournfully,
"Poor maiden! all is over;
Thine is a woman's destiny,
My power hath changed thy lover.

"The light within his heart is fled,
The fire within it burning—
The love he bears is cold and dead,
Unworthy thy returning.

"I cannot bind a broken tie—
Alas! I can but sever;
I quench Love's sweet idolatry
In many a heart for ever.

"Poor maiden! when long years are gone,
Thy heart will tell thee clearly,
'Twas well thou didst not look upon
One thou hadst loved so dearly.

"To gaze upon an altered face
With earnest, vain endeavour,
To read of love which hath no place,—
This is a grief for ever.

"How hadst thou borne th' averted eye,
The words so coldly spoken,—
While yet love's hollow mockery
Lived on in outward token,

"Without one trace of that true light,
Bright as the sun above us,
Which sparkles out with joyous might,
In all who deeply love us?"

The voice in saddest whisper died—
All, all is past and over,
Save the broad gulf which must divide
The maiden and her lover.

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne*.

THE usual monthly report of the Royal Astronomical Society for April, just published, contains amongst a variety of papers, a most interesting one entitled, "Observations of Hind's second comet in full sunshine." The visibility of a comet in the day time, and within two degrees distance from the sun, is a phenomenon of a rare occurrence, which Mr. Hind describes. He says, "I first saw the comet at 11 A.M., when the sky was perfectly cloudless about the sun, it had a whitish appearance; but during the passage of some clouds over the sun, and between the breaks, I obtained some excellent views of the comet. The nucleus was nearly round, beautifully defined and planetary, the diameter 8" or 10". Two faint branches of light formed a divided tail, like two longish erect ears or horns, arising from each side of the disc. At times I felt certain that the nucleus twinkled. The tail resembled a thin smoke." In a paper by Mr. Hind, on the expected re-appearance of the celebrated comet of 1264 and 1556, he observes, "the position of this comet in the heavens during the approaching re-appearance will be extremely unfavourable for observation; nearly the whole of the vast trajectory of this comet lies below the plane of the ecliptic, and far from the paths of the larger planets, but it extends into space more than twice the distance of the planet Neptune."

The Harper.

On the green banks of Shannon, when Sheelah was nigh,
No blithe Irish lad was so happy as I ;
No harp like my own could so cheerily play ;
And wherever I went was my poor dog Tray.

When at last I was forced from my Sheelah to part,
She said, (while the sorrow was big at her heart,)
Oh, remember your Sheelah, when far, far away,
And be kind, my dear Pat, to our poor dog Tray.

Poor dog ! he was faithful and kind, to be sure,
And he constantly loved me, although I was poor ;
When the sour-looking folks sent me heartless away,
I had always a friend in my poor dog Tray.

When the road was so dark, and the night was so cold,
And Pat and his dog were grown weary and old,
How snugly we slept in my old coat of gray !
And he licked me for kindness, my poor dog Tray !

Though my wallet was scant I remembered his case,
Nor refused my last crust to his pitiful face ;
But he died at my feet on a cold winter day,
And I played a sad lament for my poor dog Tray.

Where now shall I go, poor, forsaken, and blind ?
Can I find one to guide me so faithful and kind ?
To my sweet native village, so far, far away,
I can never more return with my poor dog Tray.

Campbell.

FRANK FAIRLEIGH;

OR, OLD COMPANIONS IN NEW SCENES.¹

CHAP. IV.

CATCHING SIGHT OF AN OLD FLAME.

UTTERLY worn out, both in mind and body, by hard reading and confinement, I determined to return to Heathfield forthwith, with "all my blushing honours thick upon me," and enjoy a few weeks' idleness before again engaging in any active course of study which might be necessary to fit me for my future profession. When the post came in, however, I received a couple of letters which rather militated against my intention of an immediate return home. A note from Harry Oaklands informed me that having some weeks ago been ordered to a milder air, he and Sir John had chosen Clifton, their decision being influenced by the fact of an old and valued friend of Sir John's residing there. He begged me to let him hear all the Cambridge news, and hoped I should join him as soon as Mrs. Fairleigh and my sister would consent to part with me. For himself, he said, he felt somewhat stronger, but still suffered much from the wound in his side. The second letter was from my mother, saying she had received an invitation from an old lady, a cousin of my father's, who resided in London, and, as she thought change of scene would do Fanny good, she had accepted it. She had been there already one week, and proposed returning at the end of the next, which she hoped would be soon enough to welcome me after the conclusion of my labours at the University. Unable to make up my mind whether to remain where I was for a week longer, or to return and await my mother's arrival at the cottage, I threw on my gown and cap, and strolled out, the frock still appearing quite a luxury to me after having been shut up so long. As I passed through the street where old Maurice the pastry-cook lived, I thought I would call and ask how Lizzie was going on, as I knew Harry would be anxious for information on this point. On entering the shop, I was most cordially received by the young lady herself, who had by this time quite recovered her good looks, and on the present occasion appeared unusually gay and animated, which was soon accounted for when her father, drawing me on one side, informed me that she was going to be married to a highly respectable young baker, who had long ago fallen a victim to her charms, and on whom she had of late deigned to take pity; the severe lesson she had been taught having induced her to overlook his intense respectability, high moral excellence, and round, good-natured face—three strong disqualifications, which had stood dreadfully in his way when striving to render himself agreeable to the romantic Fornarina. I was answering their inquiries after Oaklands, of whom they spoke in terms of the deepest gratitude, when a young man, wrapped up in a rough pea-jacket, bustled into the shop, and, without perceiving me, accosted Lizzie as follows:—

"Pray, young lady, can you inform me—what glorious buns!—where Mr.—that is to say, which of these funny old edifices may happen to be Trinity College?"

On receiving the desired information, he continued, "Much obliged. I really must trouble you for another bun. Made by your own fair hands, I presume? You see, I'm quite a stranger to this quaint old town of yours, where half the houses look like churches, and all the men like the parsons and clerks belonging to them, taking a walk in their canonicals, with four-cornered hats on their heads,—abortive attempts to square the circle, I conclude? wonderful things, very. But, when I get to Trinity, how am I to find the man I want, one Mr. Frank Fairleigh?"

Here I took the liberty of interrupting the speaker, whom I had long since recognised as Coleman,—though what could have brought him to Cambridge I was at a loss to conceive—by coming behind him, and saying, in a gruff voice,

"I am sorry you keep such low company, young man."

"And pray who may you be that are so ready with your 'young man,' I should like to know? I shall have to teach you something your tutors and dons seem to have forgotten, and that is, manners, follow!" exclaimed Freddy, turning round with a face as red as a turkey-cock, and not recognising me at first in my cap and gown: then looking at me steadily for a moment he continued, "The very man himself, by all that's comical! This is the way you read for your degree, is it?" Then with a glance towards Lizzie Maurice, he sang,

"My only looks
Were woman's looks,
And folly all they taught me."

"It's a Master of He-arts you're striving to become, I suppose?"

"Nonsense," replied I quickly, for I saw poor Lizzie coloured and looked uncomfortable; "we don't allow bad puns to be made at Cambridge."

"Then, faith, unless the *genius loci* inspires me with good ones," retorted Freddy, as we left the shop together, "the sooner I'm out of it the better."

Ten minutes' conversation served to inform me that Freddy, having been down to Bury St. Edmunds on business, had stopped at Cambridge on his way back, in order to find me out, and, if possible, induce me to accompany him home to Hillingford, and spend a few days there. This arrangement suited my case exactly, as it nearly filled up the space of time which must elapse before my mother's return, and I gladly accepted his invitation. In turn, I pressed him to remain a day or two with me, and see the lions of Cambridge; but it appeared that the mission on which he had been despatched was an important one, and would not brook delay; he must therefore return at once to report progress. As he could not stay with me, the most advisable thing seemed to be that I should go back with him. Returning, therefore, to my rooms, I set Freddy to work on some bread and cheese and ale, whilst I hastened to cram a portmanteau and carpet-bag with various indispensables. I then ran to the Hoop, and took an affectionate farewell of Mr. Frampton, making him promise to pay me a visit at Heathfield Cottage; and, in less than two hours from the time Coleman had first made his appearance, we were seated together on the roof of a stage-coach, and bowling along merrily towards Hillingford.

During our drive, Coleman recounted to me his adventures in search of Cumberland, on the day preceding the duel, and gave me a more minute description than I had yet heard of the disreputable nature of his pursuits. From what Coleman could learn, Cumberland, after having lost at the gaming-table large sums of money, of which he had by some means contrived to gain possession, had become connected with a gambling-house not far from St. James's-street, and was supposed to be one of its proprietors. Just before Coleman left town, there had been an *exposé* of some shameful proceedings which had taken place at this house,—windows had been broken, and the police obliged to make a forcible entrance; but Cumberland had as yet contrived to keep his name from appearing, although it was known that he was concerned in the affair, and would be obliged to keep out of the way at present.

"We shall take the old lady by surprise, I've a notion," said Freddy, as the coach set us down within ten minutes' walk of Elm Lodge. "I did not think I should have got the Bury St. Edmund's job over till to-morrow, and wrote that word not to expect me till

(1) Continued from p. 136.

she saw me; but she'll be glad enough to have somebody to enliven her, for the Governor's in town, and Lucy Markham is gone to stay with one of her married sisters."

"I hope I shall not cause any inconvenience, or annoy your mother."

"Annoy my grandmother! and she was dead before I was born!" exclaimed Freddy disdainfully. "Why, bless your sensitive heart, nothing that I can do annoys my mother: if I chose to bring home a mad bull in fits, or half-a-dozen young elephants with the whooping-cough, she would not be annoyed." Thus assured, nothing remained for me but silent acquiescence, and in a few minutes we reached the house.

"Where's your mistress?" inquired Freddy of the man-servant who showed us into the drawing-room.

"Upstairs, Sir, I believe; I'll send to let her know that you are arrived."

"Do so," replied Coleman, making a vigorous attack upon the fire.

"Why, Freddy, I thought you said your cousin was away from home?" inquired I.

"So she is; and what's more, she won't be back for a fortnight," was the answer.

"Here's a young lady's bonnet, however," said I.

"Nonsense," replied he; "it must be one of my mother's."

"Does Mrs. Coleman wear such spicy affairs as this?" said I, holding up for his inspection a most piquant little velvet bonnet, lined with pink.

"By Jove, no!" was the reply; "a mysterious young lady! I say, Frank, this is interesting."

As he spoke, the door flew open, and Mrs. Coleman bustled in, in a great state of maternal affection, and fuss, and confusion, and agitation.

"Why, Freddy, my dear boy, I'm delighted to see you, only I wish you hadn't come just now;—and you, too, Mr. Fairleigh,—and such a small loin of mutton for dinner; but I'm so glad to see you—looking like a ghost, so pale and thin," she added, shaking me warmly by the hand; "but what I am to do about it, or to say to him when he comes back—only I'm not a prophet to guess things before they happen— and if I did, I should always be wrong, so what use would that be, I should like to know?"

"Why, what's the row, oh, mother? the cat hasn't kitteded, has she?" asked Freddy.

"No, my dear, no, it's not that; but, your father being in town, it has all come upon me so unexpectedly; poor thing! and she looking so pretty, too; oh, dear! when I said I was all alone, I never thought of it; and so he left her here."

"Well, if it isn't the cat, what is it?" persisted Freddy.

"Why, my love, it's very unlucky—very awkward, indeed; but one comfort is, we're told, it's all for the best when every thing goes wrong—a very great comfort that, if one could but believe it; but poor Mr. Vernon, you see, he was quite unhappy, I'm sure, he looked so cross, and no wonder, having to go up to London all in a hurry, and such a cold day too."

At the mention of this name, my attention, which had been gradually dying a natural death, suddenly revived, and it was with a degree of impatience, which I could scarcely restrain, that I awaited the conclusion of Mrs. Coleman's rambling account. After a great deal of circumlocution, of which I will mercifully spare the reader the infliction, the following facts were elicited:—About an hour before our arrival, Mr. Vernon, accompanied by his ward, had called to see Mr. Coleman, and, finding he was from home, had asked for a few minutes' conversation with the lady of the house—his reason for so doing soon appeared,—he had received letters requiring his immediate presence in London on business, which might probably detain him for a day or two, and, not liking to leave Miss Saville quite alone, he had called with the intention of begging

Mrs. Coleman to allow her niece, Lucy Markham, to stay with her friend at Barstons Priory till his return, and so save her from the horrors of solitude. This plan being rendered impracticable by reason of Lucy's absence, Mrs. Coleman proposed that Miss Saville should remain with her till Mr. Vernon's return, which, she added, would be conferring a benefit on her; as her husband and son being both from home, she was sadly dull without a companion. This plan having removed all difficulties, Mr. Vernon proceeded on his journey without further delay. Good Mrs. Coleman's agitation on our arrival had been produced by the consciousness that Mr. Vernon would by no means approve of the addition of two dangerous young men to the party; however Freddy consoled her by the ingenuous sophism, that it was much better for us to have arrived together, than for him to have returned alone, as we should now neutralize each other's attractions; and, while the young lady's pleasure in our society would be doubled, she would be effectually guarded against falling in love with either of us, by reason of the impossibility of her overlooking the equal merits of what Mrs. Coleman would probably have termed "the survivor."

Having settled this knotty point to his own satisfaction, and perplexed his mother into the belief that our arrival was rather a fortunate circumstance than otherwise, Freddy despatched her to break the glorious tidings, as he called it, to the young lady, cautioning her to do so carefully, and by degrees, for that joy was very often quite as dangerous in its effects as sorrow.

Having closed the door after her, he relieved his feelings by a slight extempore hornpipe, and then slapping me on the back, exclaimed, "Here's a transcendent go! if this ain't taking the change out of old Vernon, I'm a Dutchman. Frank, you villain, you lucky dog, you've got it all your own way this time; not a chance for me; I may as well shut up shop at once, and buy myself a pair of pumps to dance in at your wedding."

"My dear fellow, how can you talk such utter nonsense?" returned I, trying to persuade myself that I was not pleased, but annoyed, at his insinuations.

"It's no nonsense, Master Frank, but, as I consider it, a very melancholy statement of facts. Why, even putting aside your 'antecedents,' as the French have it, the roasted wrist, the burnt ball-dress, and all the rest of it, look at your present advantages; here you are, just returned from the University, covered with academic honours, your cheeks paled by deep and abstruse study over the midnight lamp; your eyes flashing with an unnatural lustre, indicative of an overwrought mind; a graceful languor softening the nervous energy of your manner, and imparting additional tenderness to the fascination of your address; in fact, till you begin to get into condition again, you are the very bean ideal of what the women consider interesting and romantic."

"Well done, Freddy," replied I, "we shall discover a hidden vein of poetry in you some of these fine days; but, talking of condition, leads me to ask what time your good mother intends us to dine!"

"There, now you have spoilt it all," was the rejoinder; "however, viewed abstractedly, and without reference to the romantic, it's not such a bad notion either. I'll ring and inquire."

He accordingly did so, and, finding we had not above half an hour to wait, he proposed that we should go to our dressing-rooms and adorn, before we attempted to face "the enemy," as he rudely designated Miss Saville. It was not without a feeling of trepidation for which I should have been at a loss to account, that I ventured to turn the handle of the drawing-room door, where I expected to find the party assembled before dinner.

Miss Saville, who was seated on a low chair by Mrs. Coleman's side, rose quietly on my entrance, and advanced a step or two to meet me, holding out her hand with the unembarrassed familiarity of an old acquaintance. The graceful ease of her manner at once restored my self-possession, and, taking her proffered

hand, I expressed my pleasure at thus unexpectedly meeting her again.

"You might have come a hundred times without finding me, although Mrs. Coleman is kind enough to invite me very often. But I seldom leave home; Mr. Vernon always appears to dislike parting with me."

"I can easily conceive that," replied I; "nay, although in common with your other friends, I am a sufferer by his monopoly, I can almost pardon him for yielding to so strong a temptation."

"I wish I could flatter myself that the very complimentary construction you put upon it were the true one," replied Miss Saville, blushing slightly; "but I am afraid I should be deceiving myself if I were to imagine my society were at all indispensable to him. I believe if you were to question him on the subject, you would learn that his system is based rather on the Turkish notion, that, in order to keep a woman out of mischief, you must shut her up."

"Really, Miss Saville," exclaimed Coleman, who had entered the room in time to overhear her speech, "I am shocked to find you comparing your respectable and revered guardian to a heathen Turk, and Frank Fairleigh, instead of reproofing you for it, aiding, abetting, encouraging, and, to speak figuratively, patting you on the back."

"I'm sure, Freddy," interrupted Mrs. Coleman, who had been aroused from one of her customary fits of absence by the last few words, "Mr. Fairleigh was doing nothing of the sort; he knows better than to think of such a thing. And if he didn't, do you suppose I should sit here, and allow him to take such 'liberties?' But I believe it's all your nonsense,—and where you got such strange ideas, I'm sure I can't tell; not out of Mrs. Trimmer's Sacred History, I'm certain, though you used to read it with me every Sunday when you were a good little boy, trying to look out of the window all the time, instead of paying proper attention to your books."

During the burst of laughter which followed this speech, and in which Miss Saville, after an ineffectual struggle to repress the inclination out of respect to Mrs. Coleman, was fain to join, dinner was announced, and Coleman pairing off with the young lady, whilst I gave my arm to the old one, we proceeded to the dining room.

THE GLASS MANUFACTURE.

"Some of the numerous substances employed by man to lighten his labours, or advance his control over the material world, are so little altered by art as to retain their original and native lineaments. Thus, the timber in a ship of war is little changed from the wood of the trunk once standing in the recesses of the New Forest. But, with other materials, every characteristic of the original disappears, so that to trace the new production to its first state requires the knowledge of many distinct processes.

Amongst such instances *glass* must be classed, for in no substance is the change from the rude element to the transparent and refined material so remarkable. A heap of sand and ashes may to-day lie unnoticed in the stores of a glass-house, and to-morrow the same mass may have assumed the transparent and crystal-like forms, from which the resplendent mirror, or the star inquiring telescope, are produced.

When the mode of extracting glass from the earth was discovered, is amongst the doubtful events in human history, for neither the region in which it happened, nor the name of the discoverer, is *clearly* known. Thus, whether the result was the reward of long studies, pursued by some ancient experimenter in the ante-historical period, or the happy fruit of some accident, is unknown:

the latter is, however, more likely, for there seems little probability that any man should have deliberately commenced a search for the discovery of glass. No natural phenomenon gives a hint that so beautiful a substance was producible from the sands on the sea-shore. Long might an inquisitive ancient philosopher have paced the smooth beach, and examined the forms and multitudes of its sandy elements, without suspecting the possibility of transforming such bodies into a material bright as the dew-drops when glittering on the soft grass in a summer's morning.

Accident, the mother of so many arts, was, therefore, most likely the first teacher of the glass manufacture: and to such a source do the traditions of antiquity point. Most readers have probably heard the story, as given by Pliny, the Roman naturalist, eighteen hundred years ago, and which, if we could take the writer for an authority, would show the exact beginning of this branch of human art. Pliny makes accident the source, the Holy Land the region, and merchants the agents of the discovery. Some navigators steered their ship, laden with nitre, into the Bay of Acre, and up a small river named the Belus, on the banks of which they rested, and lighted a fire to dress their food. The cooking vessels were placed upon some blocks of the nitre, between which the fuel was laid. The heat melted the nitre, and fused it with the sands of the beach, upon which a stream of transparent matter was observed to flow: to this simple occurrence the discovery of glass is ascribed.

Now it must be confessed there is no *high* degree of improbability in the account; all seems natural enough; and this has, no doubt, induced many to acquiesce in the story, as giving a satisfactory account of the first production of glass. We are naturally disposed to receive those traditions for truths which supply us with a plausible explanation of some obscure fact. It is not here intended to impugn the story of Pliny, for that would require more knowledge than that naturalist himself possessed; but, on the other hand, we must not rest on the above statement as presenting the actual facts of the case. Pliny does but say what others had told him; and such reports may have been received without any sufficient authority; for be it remembered, that Pliny, with all his various knowledge, was a credulous man, ever on the look-out for marvellous reports, and not overburdened with the *critical* faculty. After this statement each reader must be left to admit or reject the account given by the old Italian naturalist.

But, if we are unable to ascertain the mode in which glass was discovered, we are sure that the manufacture has existed from the remotest ages. Amongst the ancient ruined cities of Egypt, articles made from glass have been found; thus the eras which beheld the erection of the pyramids, may also have witnessed the less astonishing but more useful operations of glass-making. The manufacturers of ancient Tyre were not ignorant of this beautiful substance, which they probably distributed to distant regions of the world, by their widely-extended commerce. Even amongst the ancient Chinese we find traces of this art, and a diminutive vase, of a bluish-white colour, made from this ancient Chinese glass, may be seen in the British Museum. It is well known that the Romans possessed glass vessels, as urns of this substance have been found in Herculaneum, and some of these are deposited amongst the antiquities of the Museum. The beautiful Portland Vase is formed of dark blue glass, and is supposed to have been the work of an ancient Greek artist, who must have been versed in the manufacture of the substance from which the vase is formed. Thus, in all the more important and civilized countries of the ancient world, we find a knowledge of the art, so adapted to delight the elegant, and interest the philosophical.

The production of such a substance is less important, doubtless, than the discovery of some of the more useful metals, such as iron and copper; but its uses were,

nevertheless, sufficiently appreciated to preserve the art from extinction during the night of confusion which fell upon Europe in the earlier portion of the middle ages.

Venice ranked this manufacture amongst the sources of her wealth, and guarded the secrets of the process with as much jealousy as she watched the actions of her doges. Some remains of this art are still preserved in Murano, a town about a mile north of Venice. In England some large manufactories were fixed in London, at Crutched Friars and the Strand, about the middle of the 16th century. How little the art had been previously practised in this country, may be understood from the high value and rarity of glass windows in English houses. Few circumstances illustrate this more strongly than the custom of removing such windows from the casements, and packing the frames in boxes, whenever the family removed from one habitation to another, as from a country to a town residence. But, if glass was rare and costly in the time of Elizabeth, the tastes of the people were not such as to encourage a great increase of the production from the few manufacturers; indeed, the skill of these could as little be compared with that of our glass makers in the 19th century, as the knowledge of a middle-age alchemist with the attainments of Sir Humphrey Davy. This slow advance of the art did not solely arise from the absence of patronage on the part of the government, for James I. gave a patent for the manufacture to Sir Robert Mansell; and the Duke of Buckingham, introducing skilful workmen from Venice in 1670, established a manufactory at Lambeth, where the traveller may now see the furnaces of the glass-houses burning. The existing manufactories are not the direct successors of those supported by the duke, who was too deeply involved in political intrigue at that time, to give much attention to the useful arts: his works at Lambeth, were, therefore, neglected, and, after a short period, wholly abandoned. The manufacture continued, nevertheless, to advance, though slowly, and glass became a taxable article in the time of William III.; whilst, in the reign of George II., the raw materials were made subject to a higher excise duty. The first large manufactory was established in Lancashire, a county so renowned in the history of the practical, near Prescott, where the "Governor and Company of the British cast plate-glass manufacturers," gave a decided impulse to the production of the material in Britain. This society obtained a royal charter, and the sanction of parliament, for its operations in 1773. Thus, at the very period when Hargreaves and Arkwright were developing the capabilities of cotton machines in one part of Lancashire, the capital of this company was, in another part of the same county, giving the necessary stimulus to the production of glass.

But how was the manufacture faring, meanwhile, in other European countries? The French government had early taken so strong an interest in this department of art, that persons of noble birth were *allowed* to exercise it without the loss of social position, to which a pursuit of trade or commerce generally led. So far the glass manufacture had no cause for complaint, in a time when foreign and civil wars were desolating France, and retarding the pursuit of all arts, save those of attack and defence. But the gentlemen of France were neither willing nor able to avail themselves of this allowance, so that little was done till the 17th century, when the financial genius of the minister, Colbert, included the art of glass-making amongst the commercial improvements to the development of which his labours were devoted.

As one cause of the previously slow progress of the manufacture had been ignorance respecting the proper materials, and the best modes of working, so, before much advance could be made, it was necessary to gain an insight into the usual methods pursued in countries where the art had been long practised. The agents of

Colbert, therefore, directed their attention to the glass-houses of Italy; but all their attempts to acquire the desired knowledge were, for a long time, baffled by the jealousy of the Italian manufacturers, who kept their various processes most vigilantly concealed from the knowledge of foreigners. After many devices, the French succeeded in their attempts: a number of operatives became possessed of the principles adopted by the Italians, and, soon after, in 1665, a manufactory was erected at Tourbeville, near the port of Cherbourg.

Since this period the progress of the manufacture in France has been constant, and glass is now produced in that country equal, or nearly so, in all its qualities, to the finest made in England or Germany.

Let us now describe the different processes by which this sparkling and transparent substance is produced from sand and ashes. Previously to entering upon an account of the various kinds of glass, and the different operations pursued in their production, it may be useful to give a general statement of the *materials* used in the manufacture, after which the reader will more readily apprehend the ensuing descriptions.

Glass in general consists of two bodies united by the agency of a third: these two being sand, and some alkaline substance; and the uniting matter, or the *flux*, is usually lime. Suppose a quantity of flinty sand is mingled with soda or potash; these will not be fused without the aid of a flux, which effects that singular union between the two substances, from which another, so totally distinct from each, arises. Other materials are sometimes used to perform this friendly office for the siliceous and alkaline bodies; thus, borax, and a peculiar compound of lead and oxygen called *litharge*, are employed for such a purpose. Let us glance for a moment at the nature of the two substances, the flint and the alkali, which enter so largely into the composition of the ornamental and useful material which combines the extremes of the elegant and the useful, contributing to the luxury of the palace, whilst it secures from the blast the peasant in his moorland cottage. The man who observes the long line of flint in the chalk cliffs near Dover, may not perhaps think of proposing two curious and interesting questions for his thoughts to work upon, whilst the eye is gazing on the bold scene of that historic coast. These questions are, "What *were* those flints?" and "What *may* they yet become?" To the former query science would answer thus:—those globules and plates of flint, though now so hard, were once *most probably* in a fluid state, and assumed their present form under the influence of that natural chemistry which works on all sides in the visible world.

Some of these flints are, in fact, but the sepulchres of numerous shell fish, around the bodies of which the once fluid substance has formed a solid casing. Thus he who picks up a nodule of this common material holds in his hand a memorial of the ancient earth, when some causes, now long hushed to rest, poured over the ocean beds those flinty streams which are now, by the subsiding of the sea, or the elevation of the land, made visible. It is a singular contrast in the history of the world, that so curious a memento of its early ages should be employed by men in creating additional means for diffusing elegance and comfort through the present population of the globe. This reflection will answer the supposed inquirer's second question. "What may flint become?" Thus the sight of a bit of glass leads the gazer's thoughts into two great fields of human knowledge,—the geology of the earth, and the civilization of its inhabitants. One of the elements therefore of glass is flint; the other, or the alkaline, may either be soda, potash, or pearlash, the two latter being the sediment deposited by water in which the ashes of certain plants have been soaked; the principal difference being that pearlash is more refined by roasting, which frees it from foreign substances. Soda is also procured from

vegetable ashes, but the plants in this case grow near the sea. Thus, from flint or sand, and ashes, arises the material, which, in the form of the Portland vase, the telescopic lens, or luxurious mirrors, contributes in such various modes to the refinement of life.

There are five varieties of glass, each differing much from the other, and requiring distinct operations for its production: these are—flint glass—plate glass—brown glass—broad glass—and bottle glass.

1. *Flint glass*.—This was originally named from the flint formerly used in its manufacture, but which is now superseded by fine sand, selected with care from various districts. Sand, pearlash, and litharge, are the materials generally employed for the production of flint glass; but different manufacturers use various proportions of these substances, as their scientific knowledge or experience may suggest. Some skilful glass makers fuse together one hundred parts of Lynn sand, sixty parts of litharge, and thirty of purified pearlash. The reader may here ask whether the sand required is of a peculiar nature, and whether Lynn alone supplies the necessary quantities. The sand must contain flint in some form, consequently none but silicious sand will suit the manufacturer's purpose; he is therefore compelled to draw supplies for his furnaces from those districts which yield such a material.

The principal sources in England, are Alum Bay, in the Isle of Wight, and Lynn, in Norfolk. That from Lynn is remarkably fine and white; and its exportation forms an important branch of the trade from that port. In Alum Bay the bed of sand is from thirty to fifty feet in thickness, and under this are the singular marine and fresh-water formations revealed to view in Headon Hill. But neither Lynn nor Alum Bay can yield a sufficiency of pure sand to satisfy the glass manufacturers, who have sometimes entertained apprehensions of a failure in the precious silicious deposits. Here we have another illustration of the value imparted to the simplest objects by the labours of civilized man. Of how little worth in the eyes of an ancient Briton, in the time of Cæsar, would the sands of Alum Bay or Lynn have appeared? Would Cæsar himself have seen ought in these worthy of a statesman's notice? probably not: yet such apparently barren wastes are to some more precious than a mine of gold and silver, and present the resources whence fortunes are to be extracted by a species of refined alchemy, supplied not by ignorant enthusiasm, but by sober knowledge. Were some persons to see a large ship enter the docks at Liverpool laden with sand, they might be puzzled to comprehend the use of such a cargo; but the glass manufacturer regards the vessel with pleasure, for she contains the elements of tons of finest glass, which may hereafter contribute to the pleasures of a palace, or the innocent enjoyment of a cottage. The distant shores of New Holland have been searched for this glass-sand, and vessels have crossed the Pacific laden with the singular cargo. The fears of a decline in the supply of sand entertained by some glass manufacturers, may however be as groundless as the alarms raised some years back respecting the duration of our coal fields.

THE RISE AND DECLINE OF CHIVALRY IN ENGLAND.

PART I.

"Then life was a wild and gorgeous dream,
A meteor glancing with fitful beam;
And the knight pricked forth with his lance in rest,
To far distant lands at his lady's behest;
And the Templar rushed to the Holy Land;
And the Troubadour wandered with harp in hand."

CHIVALRY, in the full and romantic sense of the term, as it is now understood, was not prevalent in England until some time after the establishment of the Norman

dynasty, nor indeed till the devotion of all Europe towards the East for the recovery of the Holy Land from the grasp of unbelievers, had imbued the whole system with that pervading feeling of religion which the earnest participation of the Hierarchy in the purposes of the Crusades had communicated to it. Nevertheless, the honour and order of knighthood had long existed, even amongst the paladins of Charlemagne, even in the dreary woods of Germany; and in England it was in operation in the days of the Saxons, and its details were at that time imbued with a religious character which the Normans, at first, contemned.

Knighthood was never a birthright, though it became a necessary obligation, to those of gentle birth after the Council of Clermont; for at this Council it was decreed, that even so early as twelve years old the nobly-born boy should take an oath before his Bishop to defend the oppressed, the widow, and the orphan; to exert himself to render travelling safe, and to destroy tyranny. Thus, says the historian of chivalry, all its humanities were sanctioned by legal and ecclesiastical power.

When from various circumstances it became an onerous and expensive duty, laws were ordained compelling the owners of adequate portions of land to assume the dignity, and these laws were fully repealed only in the reign of Charles I. Before the establishment of a standing army, knights and their followers were the only military defenders of the country. Thus we find that the all-important Castle of Dover was committed to John de Fiennes, who, with the means provided for the purpose, appropriated to its defence the services of eight other knights and their followers by turns. And thus it was elsewhere. All estates and property were held under the feudal obligation of providing knights at the call of the sovereign, in number proportionate to its value. The "legal service of a knight, for the land which he held by military tenure, was, to serve forty days at his own costs, when the king went against his enemies." This obligation was equally attached to ecclesiastical property; and it is owing to this circumstance that we frequently read of the knights attached to ecclesiastical foundations: and, as state and pomp increased, a domestic array—so to term it—of knights, became a necessary item of baronial state. Thomas à Becket had no less than seven hundred knights as part of his household; and William Longchamp, Bishop of Ely, Chancellor and Lord Chief Justice in Richard the First's time, travelled with fifteen hundred horsemen in his suite.

Though gentle birth was usually considered a necessary requisite for a knight, inferior birth, so that it were honest, was not an insurmountable obstacle to the investment of one of approved valour. But to the higher grades of the order a pure origin was indispensable. No bastard, even of a king, could be a templar or a knight of St. John. Perhaps the most remarkable instance on record of the elevation of a man of low birth to knighthood, fame, wealth, and honour, is that of Sir John Hawkwood, better known as "John of the Needle," a tailor's apprentice, and the son of a tanner of Sible Hedingham, Essex, who was pressed into the service of Edward III. Turning, as Fuller says, "his needle into a sword, and his thimble into a shield," he went to the French wars, stood like a valorous knight the hottest of the brunt at the battle of Poitiers; flying, like his own needle, at the back of his general, the Black Prince; hewing down the obdurate with his sword as smoothly as erst he had a crooked seam with his goose; winning his knighthood by valour alone—he made all Europe resound with his fame. He married

(1) Hawkwood—i. e. Falcon of the wood: derived, it is said, from the circumstance of his mother, when in labour and in dangerous circumstances, causing herself to be conveyed to a neighbouring wood, where, from some magical influence, her celebrated son was born with safety to herself.

the Duke of Milan's niece, and when he died (as even a tailor must, though he have as many lives as a cat) he had the whole city of Florence as mourners.

The mode of investiture of a knight was anciently very simple. Charles the Great merely girded a sword on his son Louis the Good, and in ancient Germany the handing of a shield or javelin to the ardent and eager aspirant conferred on him on the instant the dignity of manhood, and the honour of a defender of his country. But gradually pomp and circumstance accumulated on the ceremony. Edward the Elder, our Saxon king, had Athelstan arrayed in a scarlet robe ere he girt him with a belt ornamented with precious stones, bearing a sword in a sheath of gold. Shortly after this we hear of absolution and confession as necessary preliminaries to the ceremony, and of religious officers accompanying the ceremonial itself, of the sword being blessed, and of the Eucharist being administered to the new-made knight: and, though, as we before remarked, the Normans at first despised these religious accompaniments, it seems as though it might be only the iron-hearted Conqueror who set them at naught; for we find that his rude and licentious son, the Red-haired, was consecrated knight by Archbishop Lanfranc.

Still chivalry, which ever took its hue from the general aspect of the times, was now in its very rudest state. The feudal system was in many respects productive of anarchy and misrule; each baron was omnipotent in his own domain, the extent of which was limited only by his power and strength, and, at a period when "might made right," it is easily to be supposed that no domestic or personal virtue would secure the possession of an estate to any one more remarkable for these qualities than for the more potent consideration of military force, or the wealth to purchase it. In fact, any occupant of a domain was at the mercy of another who could muster a greater number of armed retainers. The numerous forests were occupied by banditti, who bribed the neutrality if not the connivance of those neighbouring barons who might, had they been so disposed, have somewhat assisted the feeble laws in their feeble enforcement. The abduction of females of wealth and rank was an every-day occurrence; and they were kept in rigid confinement, and oftentimes subjected to cruel usage as a means of forcing them into a marriage which should give their brutal ravishers a legal claim to their possessions. Even the royal dignity was not exempted from this degrading and abhorrent risk, for Matilda of Scotland, afterwards wife of Henry I., was obliged to assume the veil in Rumsey Abbey to avoid the risk of a forced marriage.

The cruelties practised by these lawless marauders are abhorrent even to mention. The following description from an old author refers to the period of the reign of Stephen.

"They grievously oppressed the poor people with building castles; and, when they were built, they filled them with wicked men, or rather devils, who seized both men and women who they imagined had any money, threw them into prison, and put them to more cruel tortures than the martyrs ever endured. They suffocated some in mud, and suspended others by the feet, or the head or the thumbs; kindling fire below them. They squeezed the heads of some with knotted cords, till they pierced their brains, while they threw others into dungeons swarming with serpents, snakes, and toads."

Perhaps we may venture to hope that this picture, if not exaggerated, is but of partial application, and may refer more especially to the lawless and foreign bands which the turmoils of Stephen's reign were the cause of introducing into the kingdom; for most certainly the habits of chivalry were then fast progressing towards their high and refined character. Rufus, notwithstanding his personal vices, is said to have conducted towards this result; for, unchivalric as he himself was, he could

admire knightly virtues in others, was an enthusiastic admirer of bravery, and courted the chivalrous of all countries to his society. In the reign of his successor, Henry I., an instance occurred as decidedly chivalrous as any recorded in later times. This was in the field of Audelay, when he was opposed to the French king, who took arms in behalf of Duke Robert. By tacit consent a number of each army detached themselves from the mass, in order to decide, by their individual warfare, the fate of the whole.

Although Henry the Second's reign was marked by no chivalrous displays, its prevailing characteristic had a general influence on society, which conduced (secondarily only to the religious influence of the clergy) to the production of those qualities which were the refining marks of the chivalry which distinguished the reign of Edward III., the culminating period of the Sun of Knighthood. This was the love of letters both of Beauclerc and his gay and beautiful wife. For now the Troubadour warbled his *changos* at the feet of the graceful queen, or his *serventes* in the appreciating ear of the kingly scholar. Now was it that Master Wace garbed in a familiar tongue the Latin Chronicle of Jeffrey of Monmouth, and garnished it with many a delightful legend, decorated it with many a foreign wreath, culled in the romantic plains of Brittany, and flowing with melody and music. Now it was that the knight strung his harp as he doffed his mail, and threw aside the bay encircled helmet in order to wreath his brow with the perfumed myrtle. Now was that taste for literature awakened, which found for centuries its chief, indeed its only food, in the warlike achievements of Charlemagne and his Paladins; in the marvellous actions of Alexander; in the gigantic prowess of Hercules; and far and above all, in the soul-inspiring details of the "gestes" of Arthur and his knights of the "Table Ronde," whether recording their feats of arms against whole continents of "Saracens;" their loyalty and devotion to the idolized beings from whom all inspiration was derived, those fair and gentle dames by whom, if these tales be true, Eve in Paradise must have looked homely; or, more than all, their holy quest, their painful toil, in all humbleness and devotion of heart, in search of the blessed Sangreal.

Chivalry thus regulated by religious precept, and ornamented by a taste for literature and music, and tinged strongly with romantic feeling—the fruit of these tastes—was an elevating code, and certainly tended to ennoble the human race, to humanize their untamed passions, to regulate their uncurbed wills, in an era of heretofore lawless turbulence. The zeal of its votaries may have bordered on, or, indeed, may at times have reached extravagance, but it was a zeal ever unselfish and generous; and there was no country, says M. de Palaye, where chivalry did not "exert its influence to promote public and private good." It cannot be denied, says Henry, that the spirit of the laws of chivalry was friendly to the cause of virtue.

Its characteristics, or rather, its avowed precepts and principles, those to which the newly initiated knight solemnly pledged and vowed himself, were of the highest order, and formed the great, the redeeming quality of that which we may term the modern chivalry, as distinguished from the mere heroic valour of the ancients, or that which pervaded the forests of Germany.

Not the forms merely, but the great truths and precepts of religion, were grafted on the mind, and enforced in the practice of the candidate for knighthood. To be obedient, to be temperate, to be humble, sincere, to be active and obliging, to perform humble offices with cheerfulness and grace, and to look up to elders and superiors with reverence and affectionate devotion, were the qualities daily and hourly inculcated in the domains of the chief barons and nobles, whither resorted the youth of both sexes of the inferior nobility around, to be trained in the usages and virtues of that aristocratic circle which they were afterwards to ornament.

How beautiful were the parting words of the mother of the Chevalier Bayard—the knight *sans peur et sans reproche*—to him on his quitting his paternal home to mingle in the turmoil of life!—

"As far as a mother can command her child, I command you to observe three things, and, if you fulfil them, be assured that you will live with honour in this world, and that God will bless you. The first is, that you fear God, serve him, and love him, without ever offending him, if that be possible. Be particular to pray to him every day, both morning and evening, and he will assist you. The second is, that you be gentle and courteous toward the nobility; that you evince neither hauteur nor pride towards any person; that you be ready always to oblige every person; that you avoid deceit, falsehood, and envy; that you be sober and faithful to your word. Console widows and orphans as much as in your power; avoid flatterers, and take care that you never become one. The third thing which I recommend to you is, again, charity. Neither your father nor I have a long time to live: God grant that before we die we may hear news of you which may bring honour upon ourselves and upon you! I commend you to the Divine goodness."

This advice was entirely in accordance with the general rules of chivalry.

The duties required from a knight were very arduous, and the system of training was proportionably severe. It began, at seven years old, with such athletic exercises as were suited to the age of the pupil, these gradually increasing in extent, in number, in severity, according to the increasing strength and advancing years of the novice. We shall at once understand the peremptory necessity for this early initiation, if we call to mind the dreadful and overwhelming fatigue which those persons undergo, who now occasionally, at a coronation, or a lord mayor's show, wear for a few hours an ancient suit of armour, and compare their labours with those required formerly, when a person was not thought qualified for knighthood, unless he could perform with ease the most athletic, laborious, and fatiguing exercises in full armour, for many hours together, and without showing fatigue. They were even trained to use the maul or the sword, to leap, to jump, &c., for a certain time, *without taking breath*. Doubtless many died in the training.

Falconry in all its branches, the harp, and dancing, were regularly taught as ornamental adjuncts to the more severe occupations of the youth; and "the strongest passion of the human breast was made subservient to the cause of virtue," by each youth being not merely permitted, but encouraged, to choose from the beauties of the baronial court, the fair one most suited to his fancy, whose future grace was to be won by a long series of knightly and honourable achievements.

The period of probation passed, and the novice having gradually risen through, and efficiently performed, the offices of page and esquire—with fasting, and vigil, and prayer; with earnest religious exhortation, and solemn and affectionate benediction—the youthful knight was girt with that sword, on receiving which he solemnly vowed to defend the Church; attack the wicked; respect the priesthood; protect women and the poor; to be merciful, to be courteous: to preserve the country in tranquillity; and to shed his last drop of blood in behalf of his brethren.

Every extraneous aid was afforded, which could add to the solemnity and interest of such a scene, and engage the feelings more deeply in it. The pomp and magnificence of the baronial hall, with its courtly complement of state and equipage; the unwonted honour paid to him by all around, the most distinguished knights and the most beautiful ladies vying with each other in their personal attentions to him; the white dress thrown over him, symbolical of his new character, the scarlet one, as emblematical of his resolution to shed his blood in the cause of heaven; the raising of

his head,¹ ever a symbol of servitude to God; the sword, with the semblance of a cross, to signify the death of Christ; the spear, on account of its straightness, the emblem of truth; the spurs of diligence; the helmet of modesty;—all these, and many other then well-understood symbols of faith, and honour, and duty, were conferred on the youth on his first solemn equipment as a knight, and the various duties which they intimated were impressed on his mind by every circumstance most likely to influence it.

August assemblies were often collected to witness the investiture of some person of rank, and sometimes even national hostilities were suspended for it. When Charles VI. of France knighted the sons of the Duc d'Anjou at St. Denis, the knights and ladies of England were invited to the feast by couriers sent expressly, though the two countries were then at war.

But, perhaps, the most splendid inauguration the world ever witnessed was that which was celebrated in the abbey of Westminster, in the year 1306, when the Prince of Wales, son of Edward I., received his spurs. Three hundred youths,² the hope and pride of the kingdom, the scions of its noblest aristocracy, were at the same period invested with the knightly order. Many of them, with the prince, performed their vigil in Westminster Abbey; but even this lordly precinct was not sufficiently spacious to accommodate all, and many adjourned to the Temple. But, at the time of the solemn investment, the whole three hundred youths, then in the very pride of their years, were robed in purple mantles brodered with gold, the gift of the king, and many of them decorated with furs more valuable in that day than gold.

We may fancy the pride with which the ambitious, but brave monarch, would look upon this hopeful assemblage; we may imagine the hearts swelling almost to bursting of the youths themselves; the manly exultation of their brave fathers and sponsors; the proud, yet somewhat tearful, admiration of the matrons who witnessed the son of many tears, of many hopes, thus introduced to the rough highway of the world; the intense earnestness with which the gentle and high-born maidens observed the whole, here and there one endeavouring, all vainly, to conceal her own especial interest therein.

Around, as far as the eye could reach, amid the dim arches and cloistered gloom, the space was thronged with eager beholders, heralds, pursuivants, esquires, minstrels, varlets, pages, their brilliant and party-coloured vestments contrasted with the dark cowls of the lay brothers of the monastery, or of other members who were not privileged to press nearer to the scene of action. Immense multitudes thronged the sanctuary without the walls, and every avenue leading therefrom.

Each happy candidate for the honour of knighthood was attended by two or three experienced knights; and so dense, so fearful, was the throng in that part of the Abbey near the scene of the ceremony, that, it is said, two knights were crushed to death, and many fainted.

No such catastrophe, however, had taken place, or was anticipated, when the jubilant tones of the organ, and a bustle at the further end of the church, announced to the eager multitude that the great personages were arrived, and that the ceremonies were about to commence.

Dense and unbroken as had appeared the mass, a way was insensibly opened, and first came those bearing the banners of the Abbey, which were disposed in convenient resting-places near the head of the choir. Then came the choristers in white robes, chaunting as they passed along. Acolytes, with their golden censers, flinging steams of rich incense around, which curled aloft, and melted away amid the rich tracery of the roof, were followed by various members of the Abbey, in robes of

(1) By this we must understand, generally, the actual removal only of a lock of hair.

(2) Turner and Mills: some authors say two hundred only.

state, and then by the prior of the convent, richly habited, and walking with the bearing of a prince. A priest, bearing a lofty cross, preceded the abbot, Walter de Wenlock, who wore alb, stole, and cope of the richest embroidery, and a silver mitre of priceless value, so richly was it emblazoned with pearls and gems. An immense ruby gleamed in front, and on either side were exquisitely carved images of St. Peter and St. Edward the Confessor. He carried a crosier in his right hand, turning the crook backward towards himself, indicating that his authority was limited to his own community. By his side walked the Bishop of London, for the Abbot of Westminster acknowledged no inferiority, so peculiarly was Westminster privileged. The bishop held his crosier in the left hand, with the crook forward towards the people.

These personages were followed by a priest, bearing a two-ribbed cross before the Archbishop of Canterbury, the noble, independent, and uncompromising Robert of Winchelsea,—that “thorn in the flesh” to Edward I. who had mental nerve to *refuse* a cardinal's hat; who, though an archbishop, had been so reduced in consequence of his unflinching adherence to the principles of his church, that he had not “one place of all his bishopric whercon to laie his head,” and had taken refuge in the house of “a poore persone,”—but whose unlimited hospitality, benevolent heart, high intellect, and conscientious firmness, albeit imbued with some human weakness in the shape of spiritual pride, had ultimately brought him triumphant through his hard ordeal. He was fully re-established in the favour of the king; and, until his own death in 1313, undauntedly rebuked the vices of his weak successor.

With a calm and lofty dignity, which seemed so entirely to emanate from himself as to be utterly uninfluenced by surrounding circumstances, magnificent as they were, he proceeded to the high altar, which was literally crowded with gold plate and jewellery. A thousand lights dispersed around on various altars (that of St. Edward being brilliantly conspicuous), reflected and refracted interminably the glittering gems and jewellery, the gilded banners, and the brilliant dresses, and daylight streaming in through the deeply stained windows, threw fanciful and fairylike hues on everything.

Scarcely had the prelates taken their places, when an interest, to which the foregoing was as nothing, was excited by the approach of the prince and the king. They and their immediate attendants were quickly marshalled to the places appointed for them (near which the young queen and her ladies were previously stationed), and the service commenced with the solemn performance of high mass.

This over, the prince, “the expectancy and rose of the fair state, and the observed of all observers,” modestly approached the altar, ascended the steps, and taking his sword from the scarf to which it was appended, bent his knee, and presented it to the priest. It was laid on the altar, and the priest, extending his hand over it, prayed thus:—

“Exaudi, Domine, quesumus, preces nostras, et hunc gladium quo famulus tuus accingi desiderat, Majestatis tue dextera benedicere dignare, quatenus defensio atque protectio possit esse Ecclesiarum, Viduarum, Orphanorum, omniumque Deo servientium, contra sævitiam Paganorum, aliisque insidiantibus sit potior, terror, atque formido. Per Christum Dominum nostrum,” &c.

A solemn oath to fulfil the duties of a Christian knight—which were shortly recapitulated—was then administered to him, which having taken, the prelate put the sword into his hands, saying,

“Serve Christi, sis Miles in nomine Patrie, et Filii, et Spiritus Sancti. Amen.”

Other prayers were then offered, after which young Edward retired from the altar, and, approaching the king, his father, knelt before him with clasped hands. Some appointed questions were then asked by the king

and replied to by the youth, and then the ceremony proceeded by investing him with various parts of the dress of the knight, beginning with the spurs, a magnificent golden pair, which the king handed to the young queen, who placed them on her step-son's feet, and ending with the belt, which was always the last. The king himself girt this on his son, and then giving him, as he knelt, a slight blow on the shoulder, proclaimed him a knight in the name of God and the saints. In an instant a thousand swords were gleaming in the air, whilst all the knights present hailed their new brother; and their loud acclaim being heard without, was echoed by the jubilant and accordant shout of the myriads congregated around. It sank, but was raised again and again; but, ere the swords were sheathed, and ere the voices had subsided, the tones of prayer and blessing were heard again from the altar.

Prince Edward had now the proud privilege of conferring the honour he had just received on his companions in arms, all of whom received the accolade from him; and no sooner were all admitted to the “Holy Order,” than preparation was made for another ceremony.

Amid the clangour of trumpets and the din of martial sounds, drowned, however, it is said, by the shouts of the people, several attendants passed along the Abbey, bearing two swans, covered with golden nets, and almost hidden in the studs of gold with which they were adorned. Being placed as appointed, the king advanced towards them, and, raising his hands over them, he vowed to Heaven and the swans that he would go to Scotland, and though death should be the result of the exertion, he would avenge the fate of Comyn, and the violated faith of the Scots. He adjured the prince, the nobles, and the knights, by their fealty and chivalry, that, if he should die on his journey, they would carry his body forward, and never bury it till his son had established his dominion. All assented: excited by the scene, the knights vowed themselves to various chivalrous undertakings; and Prince Edward, in the enthusiasm of the hour, vowed never to rest two nights in one place until he had accomplished his royal father's will; a vow, by the way, which he full soon forgot.

AN ACCOUNT OF THE LIFE AND WRITINGS OF MADAME GUIZOT.

THE history of a woman, and especially that of a happy woman, is soon told. Nature and society have alike combined to establish an indissoluble connexion between the happiness of woman and domestic privacy, and to fix her lot within the calm region of her duties, her affections, and her domestic avocations. Even when imperious circumstances, or a no less powerful vocation, have forced her to extend the sphere of her activity and influence, when a superiority has been bestowed which gives some celebrity to her name, it almost invariably occurs that family ties and affections, the cares and occupations of domestic life, still absorb the greater portion of her time and her energies, by constituting the chief part of her happiness. We must pity rather than envy her who has made the cultivation of her talents the principal business of life; the highest mental endowments could be to her but a poor and perhaps a miserable compensation.

The remembrance which Madame Guizot has left to her friends is happily exempt from any such regret; and to those who have known and loved her, the extraordinary powers of her mind are but the second considerations which her memory awakens. Before they can think of her claims to public regret, her friends love to

From the French.

recall the excellent qualities of her mind; they reckon the invaluable benefits which her short and sometimes troubled life conferred; with an emotion at once pleasing and painful, they first speak of her virtues, and afterwards of her talents.

But, however valuable virtue and happiness may be, there seems but little to say about them. It might satisfy the expectation of the public were we to relate in a few words the principal circumstances of a very private life, and pay a cursory homage to the qualities which have ennobled it, all our attention bearing upon the works and the talents which have alone hitherto given it an interest. Such an account would reduce us to a page of biography, followed by a critical and literary dissertation; but should we thus have made her known of whose writings only we could judge? Should we have said of her more than any one else could say? Should we have done justice to the dearest as to the most revered memorials she has left us? Is it, in short, of her that we should have spoken?

Facts have little interest if she to whom they relate is unknown. Works belong to the public, and they can judge of them better than we can. It is of the author, it is of the person herself, that we would speak; thus only can we learn something of her, and in some degree satisfy the faithfulness of our regrets, above all the wishes of that tender and sorrowing devotion which has confided, for a little, to our charge a memory so dear.

A more general and no less important reason has likewise determined us. Silence could easily be imposed upon feelings which could not be published without some sacrifice; but thought owes allegiance to virtue; great instruction always results from the life of a person equally superior in character as in mind; her example is a lesson; her life bears testimony to the opinions she has professed, and pays a tribute to virtue. Madame Guizot, by dint of experience and meditation, was enabled to refer all her feelings, and to render all her resolutions subordinate, to the general ideas that governed her mind; she had found herself as it were in the likeness of her judgment. It is then to speak of her as she would herself perhaps have wished; it is to imitate her, to unite the relation of her life to the principles she so much valued, to look for a moral end in the observations it suggests, to make the remembrance of her sentiments and actions tend to the furtherance of truth. After all, the most distinguished beings only reproduce with greater effect, and in a higher degree, the essential conditions and the general laws of humanity.

It is daily said that life is short; it appears that it neither answers to our powers, to our wants, or our desires, and that our nature overtops our destiny; and yet, when death arrives, when a human being disappears, one is often astonished at the few traces which his steps have left. Whatever place he may hold in our regret, that which he leaves void in this world is incredibly small; and, viewed as the past, the events which have occupied his days hardly appear to satisfy the duration of his existence. Those who are no more used, however, also to deplore the brevity of human life; they felt themselves pressed within narrow limits, and were uneasy in this career which they could not entirely fill up; and now their actions seem too trifling for an existence which they thought too short for them; even the friendship which regrets them finds that their remembrance holds much more room in the heart than their life does in the memory. May it not be that there are always in the soul a multitude of wants and faculties, of feelings and ideas, which nothing here below calls forth! May it not be that none can take advantage of his whole nature, and that those who have been most prodigal of action, emotion, and thought, still carry to the grave an unapplied treasure of energy, of feeling, and of intellect? Such is the perpetual contrast between our nature and our destiny. There is in us something

infinite which this world cannot satisfy, and which cannot influence this world; therefore it is that we are at once superior to the world, and restrained by it; therefore it is that we can neither put up the whole canvass of our life, or display all our material. In fact, so far from activity, properly so called, occupying all our duration, the greater part of it is perhaps consumed in objectless emotions, barren sensibilities, and vague reveries. A thousand things pass within us, which prove and develop us, and make known to ourselves what no others can know. The world sees and conjectures but a small part of our real existence; what is manifest is but one feature of the picture, and we live much more than is apparent. This inherent and superabundant activity to which circumstances and often external power are wanting, those insatiable desires, that never failing sensibility, that constant renewing of the mind, which more than any sensible object presents the emblem of perpetual motion, all this riches of man which he cannot use, which he knows not how to use; in short, this superfluity of his nature, clearly attest that he is superior to his condition, and that he is reserved for a higher destiny than that of earth: embroidered robes, mysterious tokens found in the cradle of a deserted child.

But this interior life which nothing can interrupt, nothing limit, does not betray itself; it remains the secret of each individual. Man only appears for about a moment to his fellow creatures; at all other times he steals away from their view, and reveals himself only to his God. Perhaps this is saying too much; this internal solitude is not invariably his lot.

Undoubtedly many more have passed through the crowd, have borne even all the ties of family and society, without ever having been drawn out or fully disclosed; but there are also some minds which hold communion with each other, and pour out their thoughts with little less reserve than to their Maker; sympathy disperses the cloud which separates them; love lifts the veil which covers their hearts, and thus the minds of men are sometimes made known, but only to those who love them.

It is for this reason that no account of those of whom death has deprived them, can give satisfaction to their friends. They know more of them than could possibly be related, more than they could themselves repeat; what would be most interesting to them would perhaps be the narration of that part of their life which belongs not to history; they would wish to read over all that they have known, all that they have imagined, and that words could equal the vastness of their desire. But this wish is vain; the more distinguished a person has been, the less is it possible to do him justice by description; he would perhaps himself have failed, had he endeavoured to give an account of his heart, and to reveal, without restraint, what can never be justly known or faithfully described. These considerations have powerfully influenced me whenever I have attempted to recall the circumstances of Madame Guizot's life; it is not, in fact, those circumstances that are interesting, it is herself. She is the soul of the drama; and it is her especially, whom having known, we would wish to make known. Yet how shall we ever accomplish it? How penetrate into those secrets of the mind at once infinite and delicate, into that interior world which conscience itself cannot survey, and entirely elucidate? The difficulty is insurmountable; it discourages, it depresses, and it is with reluctance that I write this account which will not satisfy either memory or truth.

We must then renounce the idea of showing what Madame Guizot was in the opinion of her friends; indeed we scarcely know how to add anything to that which the attentive and intelligent readers of her works must already have formed of her. We can only join our testimony to their conjectures, and assure them that she possessed all that might be expected from her writings; and still we must add that, except by those

who knew and loved her, she could not be justly appreciated.

Elizabeth Charlotte Pauline de Meulan was born at Paris, on the 2nd November, 1778. She was the eldest daughter of Charles Jacques Louis de Meulan, Receiver-General of Paris, and of Marguerite Jeanne de Saint Chamans.

Her parents had all the feelings and tastes which distinguished good society at the end of the last century. They took advantage of their large fortune and position in the world, to open their house to a brilliant and literary society, that made conversation its only occupation and its primary amusement. This liberality of mind, then so common in the Parisian world, gave them some leaning towards the new opinions, which they adopted with confidence, but not with zeal; and amongst the distinguished men of the time they preferred those of the moderate party. It was one of those families of which M. Neckar was the minister; that is to say, who prepared the way for the revolution without either desiring or foreseeing it.

Madame de Meulan showed an early and marked partiality for her daughter, and lavished on her all the cares which a weak and sickly childhood required. From her earliest years she manifested a lively sensibility, a perfect integrity, and, when her education commenced, an extreme facility in learning. Her mind, however, still appeared inactive, tractable, and thoughtful; she gave herself up to the employments of her age, without taking interest in them; her lessons neither wearied her nor gave her pleasure. She went through her duties because she liked order, and it was more easy to obey than to resist. When, between ten and fourteen years of age, the quickness of her understanding struck the attention of her masters, and excited the hopes of her family, she still continued to carry but little spirit or taste into her studies. She sometimes composed fables and little dramas, as many children do who never afterwards excel. These essays, destitute of originality and invention, were only remarkable for singular correctness, and here and there some happy strokes of feeling; but there was nothing that indicated either that energy or that independence which were one day to rank high in the qualities of her disposition and her mind. Thoughtful and silent, she seemed to be waiting for that external cause which was to give her the impulse that she wanted. It is seldom that the stimulating power of circumstances can be dispensed with in the development of the mind, more especially that of a female, of even the most distinguished talents. Called by nature to hold, in a certain degree, a position of dependence, and her own instinctive modesty keeping her talents in the shade, a woman's mind is never fully known, even to herself, till some powerful cause arises, which, touching the key-stone of her heart, calls forth the latent powers of her mind, and shows her what she is. She quietly awaits a voice to say, "Arise and walk."

As Mademoiselle de Meulan began to advance from childhood, she felt a vague necessity of finding some employment for her faculties, though she was conscious of her inability of bringing them herself into play. She has described this feeling in a letter dated 1822. She says, "At that period (1787), I was exactly at the age when I began to take some interest in life, when, after a childhood to which no one knew how to give the impetus that I had not strength to find in myself, I began to feel the energy of existence. I was coming out of the clouds, and awoke as on a fine day in spring. This is the remembrance that I have of that age."

She was nearly sixteen when the revolution broke out. She lived in the midst of every opinion, but held none of them. It was not long before discontent and disturbance were spread around her, and, though she judged of the events of this time with severity, yet she enjoyed the liberty, the excitement it occasioned. She always preserved a very

lively recollection of the society of that period, and of the two sittings of the National Assembly, at which she had been present. From that time a strong leaning towards equality took possession of her mind; therefore it was not through the changes introduced into the social system that the revolution wounded her; the violence and injustice, the readiness to sacrifice right to power, the taste for licentiousness and disorder;—in short, all the evils unhappily inseparable from civil strife, struck her so forcibly, that she retained through life a kind of resentment against the revolution, for having caused her so much suffering. Such was the impression it left on her, that she was not able to speak of it with calmness thirty years afterwards; and it required all the influence of her reason to appreciate that period with the impartiality due to history. She herself distrusted her own remembrances, and, with a candour by no means common, did not make them the rule of her judgment.

To public misfortune, there were soon to be added private ones to her. The fortune of her family had gone, the health of her father became impaired, and he died in 1790, leaving his family in poverty and affliction. Her mother, suddenly taken from a state of ease and opulence, struggled painfully against the difficulties of a situation so new and so severe; her friends, dispersed or persecuted, could give her neither advice nor assistance.

In despair about the future prospects of her three brothers, and a sister whom she passionately loved, sympathy, devotedness, and grief, absorbed all the faculties of her mind. Becoming more and more a stranger to public events, of which she only heard by report, she used all the power and influence she possessed in consoling and encouraging her family, in suggesting the courageous part, so difficult to practise by those who have long been accustomed to prosperity, but which alone can put an end to the vexations occasioned by a total overthrow of fortune or position.

In 1794, a general law exiled her family from Paris. Retired into profound solitude in the country, she found some repose, and was able to reflect with more freedom upon the strong or painful emotions which so many causes had excited in her. Thus she became accustomed to unite solitary meditation with penetrating emotion, and sometimes to place them in opposition to each other. Cruelly forced to feel, she learned to think. It was in her distant retreat of Passy that she became, as it were, intimately acquainted with herself. She could almost remember the day when, occupied in drawing, the idea first struck her, that she might have some genius. This discovery gave her great joy; she seemed from that time to feel less alone in the world, and to have a certainty of never being destitute: she had just discovered a friend. Genius is perhaps one of the few benefits that can be possessed without mixture; joined to virtue, it leaves no regret after it.

From the time she became conscious of her abilities, her energy redoubled, and her interest in life increased. A great moral force, which was productive of extreme mental and bodily activity, became the predominating feature of her character, and her chief resource against misfortune and vexation. By a happy privilege of nature, the development of her mind, the taste she had acquired for meditation, for the study of herself, and for her inquiries after truth, did not in any degree lessen her devotedness to the positive duties of life; on the contrary, she became more vigorous, more decided, more stirring, if I may so speak, in the interest of those whom she considered as confided to her charge. She acquired an ever increasing influence in the direction of the family affairs, and took upon herself all the labours and difficulties attending them. She learned to struggle against every obstacle, and from that time she conceived the fondness, the admiration which she ever afterwards preserved, for persevering activity, in contending with the difficulties of life. Confiding in her youth and strength, she accustomed herself never to be disheartened,

never to give up as long as a single resource remained; and became firmly fixed in the opinion, that the only endurance which does not proceed from weakness, is that which does not yield till resistance has been exhausted. "It is this stubborn vigour," she herself says, "that has been the prop and support of my youth."

(To be continued.)

THE SIGN-PAINTER.

FROM THE GERMAN OF A. ARNOULD.

ABSORBED in the contemplation of the picture that he was on the point of completing, Ribera, the painter, stood before his easel. Once more he seemed intent on scrutinizing its every line; then, suddenly stepping back a few paces, "Yes," he exclaimed, in the self-complacent pride of the artist—"yes, indeed, it is a masterpiece; it beats Caravaggio himself, and not a touch more will I add to it!" So saying, he dashed aside both pencil and palette with such thoughtless vehemence as to throw down the half-finished portrait of a lady, that stood in the corner of his studio. Ribera, however, was too deeply engaged in the contemplation of his work to notice the unfortunate result of his rashness. With folded arms he continued standing before the picture, recapitulating with a well-satisfied air, and the most off-hand humour, the several beauties that his self-love discovered. Scarcely ever have the creations of Raphael's pencil been so richly rewarded with encomium, and a cicerone, showing some lover of art a masterpiece that had been the admiration of centuries, however voluble he might be of tongue, would scarcely have chanced upon a strain of commendation equal to that which our painter now lavished so profusely on himself. At moments he would stay the course of his criticism, but only for the purpose of favouring himself with eulogiums that told of anything but modesty.

"I knew well enough," said he, with his hand upon his brow, "that there was no lack of genius here. I might now lay me down at once and die, and my name would be rescued for ever from oblivion. But I hope God will still lengthen the span of my days. It surely cannot be his will, that the secret of painting well, which he revealed to me in the cradle, should be prematurely buried with me in the grave; but he will rather let me gladden myself with my fame. Bitter enough has been the struggle for it; for, ere attaining to it, I have had to conquer self-distrust, and misery, and pain. How often have I had no other place of refuge in which to lay my head than the porch of the church, or the cavern in the mountain! How often have I been without the morsel of bread that would have satisfied hunger; or, destitute even of a shred of canvass, have traced my pictures with my finger in the sand upon the shore, for the wind to sweep them away! or, when I have shaped forth my budding fancies on the city walls or the palaces of the great, how often have the servants come, at the behest of their masters, to blur them out, without one of them understanding that they were the work of an artist—of an artist, too, in the need of alms! But I murmur not at these hard trials before Thee, my God. Thou hast granted me, in the fairest period of my life, to reach the goal of my aspirations, Thou hast given me strength for the struggle, and faith to sustain me; for all those who are destined by Thee to soar above the vulgar throng must first, like Thine own Son, our Saviour, wear the crown of thorns."

He was still in the full glow of enthusiasm, when the door of his studio opened, and a little wrinkle-faced old dame shuffled in;—it was the venerable Beatrix. She

brought in a wooden trencher, with a very spare meal upon it, and laid it down on one side; but finding that the painter took no sort of notice of her, she at last endeavoured to make him conscious of her presence.

"When I heard you talking so loud, as I came up stairs," said she, "I thought I should find the real *old gentleman* himself with you, that you are so familiar with. What were you screaming about in that manner? You must either have been dreaming aloud, or been talking to the Wicked One in bodily form. A fine acquaintance that, forsooth! It was he, I trow, that gave you the idea of that horrible picture there, that makes my hair stand on end every time I look at it; a thing you have been labouring at, and nothing else, for three whole months. How can you wonder at our good viceroy, the Count of Monterey, giving you no employment, if you waste your time on such unsightly things as these? How can you expect any one to take up with such a hideous picture? Why, the very women would be before their time at the sight of it."

"It is truly lamentable, good Beatrix, that it does not please thee," said Ribera, patting her gently on the shoulder.

"It is much more lamentable to think that you are minded to die of hunger," replied the old dame; "and, scanty as your dinner is to-day, I only wish you may have the like of it to-morrow; but before that can happen you must give me the means, for mine are all gone,—and yet you will always keep saying you could be rich if you liked. Why have not you finished the Countess of Venutia's portrait—a lady who would fairly have covered the canvass with gold for you, and procured you the patronage of the Viceroy himself? It might have been the making of you! But no; whenever she came, you always behaved as foolishly as you could, or even told me to tell her downright that you were not at home. God knows what it cost me to utter such lies as those! Go and be wiser!"

"Don't talk to me of that woman, Beatrix," said Ribera, "with her shilly-shally face, and passionless eye. Why, I would have made her uglier than she really is! Ah! if I had had the young girl to copy from whom I met about three months ago, and purposely avoided seeing again, lest the remembrance of so lovely an image should disturb me in my retirement—Ah! I would have painted her with rapture!"

Beatrix was a listener no longer. As soon as Ribera began to excuse his own idleness by the ugliness of the Countess, she had pitifully shrugged her shoulders; and, turning her back upon him, she now beheld that ill-fated portrait upon the ground. She immediately hastened to raise it.

"Heavens! what is this?" said she. "How wonderful! Of a truth the devil hath been keeping holiday with you, and put out one of the Countess's eyes by way of pastime."

"Pshaw!" replied the artist, with a laugh, as he remembered by what mischance it had happened. "Sooth, never was my arm directed to better purpose, and I only wish that the same palette which flew by chance into this eye had done as much for that of the original. Then I should be quit of this wearisome Countess, or should at least be able to find many a prettier profile."

"You are a fool," said Beatrix; "happily for you, your friends have not lost their wits, but have been thinking more of your welfare than you yourself have. Dress yourself now, and go and find out Christophoro Panolfo; he is waiting for you."

"Who is this man?"

"One of the richest merchants in Naples."

"I know him not."

"But he knows you. They have been talking to him about you; he has a good opinion of your talents, and wants to order a picture of you. Now, this is as good as ready money; will you reject this, too, as well as the rest?"

"No, certainly not," said Ribera. "If this Panolfo is a judge, and will take the trouble to come to me, he will, beyond all doubt, set a respectable price on this masterpiece before us."

"What! you will not even call upon him?"

At this question Ribera shrugged his shoulders, and began to whistle.

"No! this is past all bearing!" cried Beatrix, in the greatest indignation, while she planted herself before him with an almost threatening air. "I tell you plainly, you must go to Panolfo, if I have to drag you by the collar to his door."

Ribera, who delighted to put her in a passion, merely shook his head.

"What will you bet me," continued she, "that I do not bring you to obedience? Fie! shame on you: this shows a bad heart, Ribera! Are you alone in the world, that you act thus? Our holy Father, the Pope, himself, has given me a dispensation from fasting in consideration of my age, and you condemn me to it. If you are to die of hunger, do you think that I will eat? Forwards, child!" continued the old woman, assuming a milder tone—"forwards at once, for I know you love me, on account of the friendship I bear to you. Though just at first I made you angry by speaking ill of your painting, yet you must pardon me now, and go to Panolfo. Here is your sword, and here your cocked hat, which becomes you vastly when you just perch it a little on one side in this way, over the left ear: you may hide your jerkin beneath your mantle, for it is a little too shabby to be seen in open day-light. Ah! just so; head up, my child; eyes well open, and the moustache brought nicely to point. Heaven help me, if you look not as proud and grand as the Emperor Charles V. in his own mighty person! If you find any gentlewoman at Panolfo's, show them your handsome face, and look tenderly on them;—I, too, once was young, and I know what I am talking about."

Still chattering on, as if she would never cease, Beatrix waited only till the artist had finished attiring himself, and then, thrusting him out of the room, she gave him one more volley of encouragement as he descended the stairs.

"When you get to the other end of the town, ask for the merchant Panolfo. Mind you do not forget his name; he lives in the grand square, nearly opposite the palace of the Viceroy. Fare ye well, fare ye well, and bring me all the good news you can."

Not yet fully resolved whether he should go in search of the merchant or not, Ribera was sauntering on through the streets, when, a few hundred yards from his own door, he met one of his friends, the young Octavio, who, less by his talent than by a supple and intriguing character, had gained the notice of the Viceroy, and was recognised as one of his privileged favourites. Octavio approached him, and expressed no little astonishment at seeing him again.

"What have you been about?" said he; "it is an eternity since I saw you last."

"I have been hard at work in the meantime," answered Ribera; and thereupon he reminded him of his repeated promises of saying a word for him to Count Monterei.

"Ah! good heavens!" cried Octavio, "not a day passes, but what I mention your name to him. But what is it you want? You are nowhere to be found. If the count could but see a picture by you!"

"Do you really think he would be inclined to lend me a helping hand?"

"Not a moment's doubt of it. Such talents as yours, they need only be known to be valued. Besides, you know, I am always at hand to exclaim, at the sight of your performances, Admirable! excellent! sublime!"

"Nothing could be more opportune," returned Ribera, "for I have just finished a picture, than which, without any vanity, I may say, I never did a better. If

you would like to form your own judgment upon it, perhaps you will step back with me now."

"Not just now," said Octavio; "I have an appointment that makes it impossible; but to-morrow, or the day after. You are right—nothing could be more opportune, and I will speak to the count about you. Farewell, my good fellow, fare you well." So saying, he turned on his heel, and was soon out of sight.

"Now I will go to the merchant," said Ribera; "it may well be, that the patronage of a stranger, though he looks down upon me with contempt, will avail me more than the hypocritical grimaces of officious and pretended friendship. Yes, yes, look well to the post you have won so craftily. Keep an eye on the portals of the palace—guard well its entrances; for when once I have set foot across the threshold, I will drive ye out, as our Saviour did the dealers from the Temple. What! ye are jealous of me, ye limners! ye are afraid of me! and so, to lull me to sleep, ye accord me your patronage! But may I be one of the daubers that ye are, my fine fellows, if I do not find the means of rising without you!"

At length Ribera arrived at Panolfo's house. Two of the servants conducted him into a richly furnished apartment, which afforded a magnificent view of the spacious garden adjoining it, and of the azure sea in the distance. A middle-aged man, duly favoured with corpulence, with a dull and vulgar cast of features, and a mouth continually opened to its utmost width, paced, gaping, up and down the room. At the open window sat a young girl, with her head resting on her hand, eagerly inspiring the perfume of the orange grove and the aromatic odours wafted on the breeze from the sea. Ribera made his salutation on entering; but, the moment his eye rested on the young maiden's face, he turned red as fire, and quite lost his self-command, for he at once recognised the beautiful creature of whom he had been talking to Beatrix but an hour before, and it was with difficulty that he now faltered forth his name. Laura, indeed, was of extraordinary beauty. There Ribera stood in utter embarrassment, twirling his hat round between his fingers, and totally incapable of speech. The merchant, who, at his entrance, had checked his peregrinations about his room, attributed Ribera's embarrassment to his ignorance of the world, and awkwardly endeavoured to inspire him with courage. This blunt condescension aroused the painter from his fit of transport, and restored him to the full influence of his native pride. Rising to his full height, he answered thus: "Neither wealth nor power, nor aught that is wont to inspire others with awe, could humble me or fix my gaze on the earth—through beauty alone God manifests to me His majesty; and if you beheld me in embarrassment, it was from no other cause than my admiration of His most beautiful masterpiece." His eye met Laura's, and it could not escape him that Panolfo's daughter participated in his feelings. The spell-work of enchantment, as it were, had taken both of them captive; and, before they had exchanged a single word, the mute language of the eye had told them that they loved. Panolfo it was who unconsciously contributed most to further the quick flame of affection; for the more he played the patron before the artist, the more sympathizing grew Laura's glances, and the more eager she seemed to compensate him for the pain of humiliation.

"They tell me, Sir," began the merchant, "that you are not wanting in talent"—Ribera bowed—"but that you are poor and in need of work. I have always taken pleasure in promoting the arts. We will see whether you deserve one's patronage."

Ribera frowned and bit his lip, lest he should be tempted to repay such insolence in kind. Laura noticed this involuntary play of his features, and, seeking to calm the rising storm, "You are a stranger here, Sir?" said she.

Her voice seemed to vibrate on the painter's heart.

His brow grew smooth again, and he replied, "I was born in Spain, Signora, in Xativa, near Valencia. But I left my home and family as a child, and have never seen them since; and, setting aside the time that I have passed in your native country, I am the more entitled to consider myself a scion of Italy, since the bloom of youth is over with me, and now particular ties attach me to the soil. I have been in Rome, Venice, Florence, and Parma. In every corner of the land I have left traces of me behind me; wherever the art of the painter flourishes, I have gathered, like the bee, the down off the blossom, and prepared my honey. I am now settled at Naples, and never think of leaving it again."

"What induces you, Sir Painter, to give this city the flattering preference?" said the merchant. Ribera felt his blood ready to rise again: he collected himself, however, and "That is a secret, Signor," he replied.

"You are too curious, father," said Laura, throwing in a word of conciliation. "Signor Ribera will, perhaps, give you to understand that he *loves*."

"Yes, Signor," returned Ribera, "he loves, and with an ardour that will last for his life." Now it was Laura's turn to blush, and Ribera became more confused than before, when he saw her, too, incapable of concealing her embarrassment.

"A truce to that!" cried Panolfo: "you reproach me with curiosity, Laura, and you are a hundred times more curious than I. Come, good sir, and let us talk of business. Are you inclined to earn five and twenty ducats? But, first of all, what branch of the art do you pursue?"

"Tell me only," said Ribera, "what you think of ordering."

"A sign for my ware-rooms."

Ribera moved as if to rise, but an imploring look from Laura restrained him: his excitement, however, was so great that he could not find words to say whether he refused or accepted the proposal.

"Are you not inclined for it?" continued Panolfo. "Why, it would be the finest possible opportunity of making yourself known; and, if you have any talent, you could have no better way of exhibiting it to the public. Do something decent for me, and all my fellow-merchants will give you commissions forthwith."

"Will you entrust the choice of the subject to me?" said Ribera. "Only on condition that I am allowed to paint you something of my own free choosing, can I accept your proposal."

"Well," returned the merchant, "I have confidence in you: do what you like for me."

"And what price do you stipulate for?" continued Ribera, with a smile of bitterness.

"As I told you before, five and twenty ducats; and that, according to my notions, is paying the thing well. You need only make a beginning; and if I am satisfied, I will let you paint my portrait, too, and double the amount. You see, I know how to do things."

"My thanks to you," cried Ribera, rising to his full height. "However, had you left it to me to fix the price, I should have demanded five hundred ducats. But I will make a proposition to you, that may lead to an agreement between us. I only ask permission of you to fix the picture that you have ordered of me, for one single day, over the door of your house, and it shall not cost you a farthing. You are right—I must make myself known, and I now seize the opportunity that presents itself. You may give out publicly, Signor, that you have concluded a good bargain with the first painter in Naples. In a short time we shall meet again. Farewell, Signora."

Laura softly opened on him her beautiful eyes, that seemed to say to him, "Be really what thou believest thyself to be, and Laura's hand be the reward of thy talent."

Ribera withdrew. Slowly he descended the stairway;

and when, on his way through the garden, he passed beneath the window of the apartment which he had but just quitted, a purse fell at his feet. It contained five hundred ducats, and a slip of paper, on which was written, "My hand and my fortune for the first painter in Naples."
